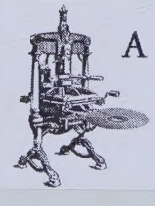
The AMERICANA ANNUAL 1960



A Gift from the Estate of
Michael Hart
www.gutenberg.org

FRONTISPIECE

President Dwight D. Eisenhower and Soviet Premier Nikita S. Khrushchev, leaders of the free and Communist worlds, respectively, meet on Sept. 15, 1959, at Andrews Air Force Base, Md., as the Soviet leader arrives in the United States for an official 13-day visit.

Foreword . . .

The completion of a decade is both an ending and a beginning. It is, in some respects, like rounding a corner onto a new avenue, the exploration of which promises to be an exciting and even challenging adventure. But passage from the 1950's to the 1960's signalizes not only the ending of one decade and the beginning of another; it also marks the transition from an earthbound age to a new space age in which conquest of the moon is only one of the more immediate goals. The question of how well man has equipped himself to travel the uncharted road ahead can be answered only in the future.

This is the 38th edition of a world-events yearbook which, in the past several years, has ranked as an international best-seller. THE AMERICANA ANNUAL now is widely used for reference and casual reading throughout most of the civilized world. During the past decade alone, THE ANNUAL has selected, analyzed, and summarized in approximately nine thousand fact-filled pages the significant information concerning the important discoveries, historical events, and personalities of ten momentous years. The history of the decade which has been called the "Fabulous Fifties"—like that of each year since 1922—was recorded in THE ANNUAL as it was being made, and it now stands as a key to much that will happen in the 1960's.

That part of the record for the year 1959 is the concern of this volume, with its hundreds of articles by specialists in their respective fields. Here, for example, are treated such timely scientific topics as the problem of *Radiation* (italics indicate article headings), peacetime applications of *Atomic Energy,* progress in such fields of medicine as *Cancer* and *Heart Disease,* studies in *Food Research* and *Nutrition,* current advances in *Missiles,* and the technological, medical, and legal aspects of *Space Flight.* Major international political developments are highlighted in such comprehensive surveys as those of *Africa,* the *Far East, Inter-American Affairs,* and the *Middle East;* in coverage of the travels and policies of President *Eisenhower* and Soviet Premier *Khrushchev;* and in the discussions of such important issues as *Disarmament, Summit Conference,* and *Foreign Policy of the United States.* Also covered are such major domestic developments in the *United States* as the admission to the Union of *Alaska* and *Hawaii,* effects of the strike in the *Iron and Steel* industry, and the passing from the scene of such figures as John Foster *Dulles,* George C. *Marshall,* and Frank Lloyd *Wright.*

Space allows only this very brief sampling of the vast number of newsworthy topics covered in these pages—topics which made the headlines yesterday and which form the steppingstones for the events of tomorrow. This book represents the thought and labor of thousands of persons—from contributing authors, advisers, and suppliers of specific information, to editorial and production staff members. To each of them who, with patience and good will, fought the battle of deadlines, the editor wishes to express his most sincere gratitude.

J. J. S.

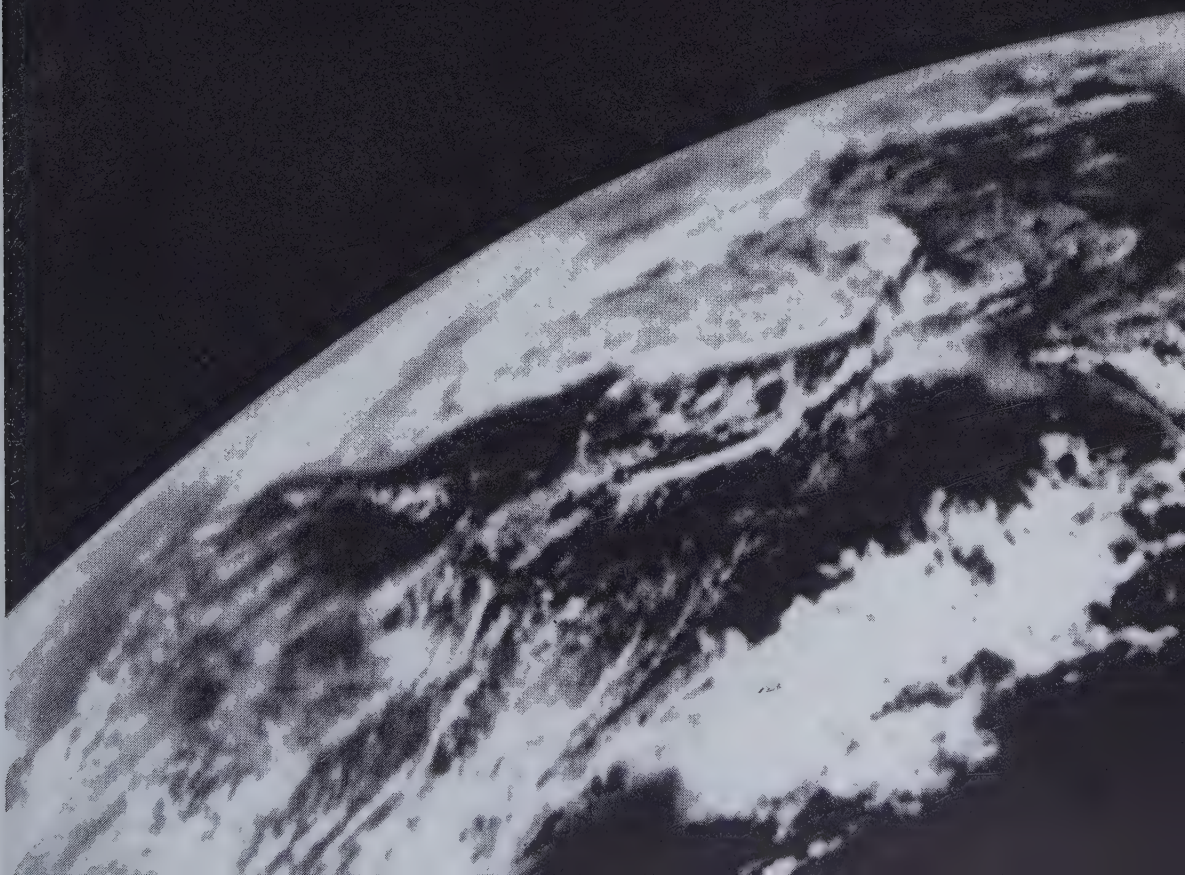
Opposite page: **The earth as photographed from approximately 700 miles up on Aug. 24, 1959, by a camera installed in a recoverable capsule in the nose cone of an Air Force Atlas missile. Part of South America can be seen at the center horizon; the dark triangular area slightly left of center is the Amazon River delta. Africa is at the lower left.**

U.S. AIR FORCE

CHRONOLOGY
the events of 1959



CHRONOLOGY . . 1959

PART 1 . . The Outstanding Dates of the Year

JANUARY

1—Cuban President Fulgencio Batista resigns and flees the country, as rebel forces under Fidel Castro take Santiago de Cuba.

First stage in reduction of tariffs within European Economic Community goes into effect.

2—USSR launches Lunik I (Mechta) rocket which soared past moon (Jan. 4) into orbit around sun.

Castro forces take over Havana; Dr. Manuel Urrutia is proclaimed provisional president of Cuba.

3—President Eisenhower signs document proclaiming Alaska 49th state of Union; signs executive order redesigning U.S. flag to contain 49 stars.

4—Soviet First Deputy Premier Anastas I. Mikoyan arrives in Washington on two-week visit to U.S.

4–5—Anti-European rioting by Africans demanding independence in Léopoldville, Belgian Congo, results in 71 persons killed.

8—Gen. Charles de Gaulle takes office as president of France for seven-year term.

10—Michel Debré takes office as premier of France.

17—President Eisenhower and Soviet First Deputy Premier Mikoyan confer in Washington on Germany, disarmament, and other world problems.

19—Virginia's school segregation and school closure laws held unconstitutional in court actions.

22—Argentine general strike collapses after 4 days, in face of strong government antistrike measures.

25—Pope John XXIII says he will call ecumenical council to seek unity of world Christian communities.

26—Italian Premier Amintore Fanfani resigns, following split in coalition cabinet.

27—At opening of 21st Congress of Soviet Communist Party in Moscow, Soviet Premier Khrushchev says Soviet space rocketry has gained military superiority for socialist world.

FEBRUARY

2—Public school integration begins at Norfolk, Va.

3–4—Premiers of 12 African autonomous republics of French Community confer with French President de Gaulle in Paris, in first meeting of Community's Executive Council.

5—U.S. State Department reveals tape recording of radio conversation by Soviet pilots while shooting down U.S. Air Force transport over Soviet Armenia on Sept. 2, 1958.

16—Antonio Segni becomes premier of Christian Democratic cabinet of Italy, ending three-week impasse.

Fidel Castro takes office as premier of Cuba.

17—Vanguard II satellite is launched into orbit.

19—British Prime Minister Macmillan, Greek Premier Karamanlis, Turkish Premier Menderes, Greek Cypriote leader Archbishop Makarios III, and Turkish Cypriote leader Kutchuk sign agreement in London to constitute Cyprus an independent republic.

19–20—President Eisenhower and Mexican President Adolfo López Mateos confer at Acapulco, Mexico; agree on construction of Diablo Dam and U.S.–Mexican economic collaboration.

21—British Prime Minister Macmillan arrives in Moscow.

MARCH

1—Archbishop Makarios returns to Cyprus after three-year exile.

2–3—African nationalists riot in Nyasaland, following outlawing of African National Congress and arrest of Hastings Banda, congress president; 32 Africans killed by security forces.

3—U.S. Army launches Juno II rocket carrying 13.4-pound Pioneer IV space probe toward moon.

3—British Prime Minister Macmillan and Soviet Premier Khrushchev end talks in Moscow without agreement on Berlin or other issues.

Iran announces it no longer recognizes as valid the clauses in 1921 pact with USSR which give the Soviet Union the right to move troops into Iran if forces threatening USSR enter Iran.

4—Pioneer IV passes moon, heads for orbit around sun.

5—U.S. signs bilateral defense pacts with Iran, Pakistan, and Turkey, in Ankara, Turkey.

9—Iraq government reports that pro-Nasser rebellion in Mosul region has been crushed after 3 days.

13—Fighting breaks out in Lhasa, Tibet, between populace and Chinese Communist forces.

16—President Eisenhower, in nationwide address, says U.S. will not forsake people of West Berlin but is willing to take part in summit talks if foreign ministers conference promises fruitful outcome.

17—Canadian Secretary of State for External Affairs Sidney E. Smith dies in Ottawa, aged 62.

18—President Eisenhower signs legislation for admission of Hawaii as 50th state of Union.

Project Argus, involving three nuclear detonations at altitudes of 300 miles, is revealed to have taken place in South Atlantic on Aug. 27, Aug. 30, and Sept. 6, 1958.

20—New Delhi reports that open warfare against Chinese Communists has broken out in Tibet, with Tibetan populace joining rebellious Khamba tribes.

20–23—President Eisenhower and Prime Minister Macmillan confer at Camp David, Md., and in Washington on West's position concerning West Berlin in forthcoming foreign ministers meetings.

24—Iraq Premier Abdul Karim al-Kassem announces Iraq's withdrawal from Baghdad Pact.

28—Chinese Communist Premier Chou En-lai dissolves Tibetan government headed by Dalai Lama; puts Panchen Lama at head of Preparatory Committee for Tibetan Autonomous Region.

31—Dalai Lama of Tibet crosses border into India, seeking asylum.

APRIL

1—Foreign ministers of U.S., Britain, France, and West Germany end two-day talks in Washington; state desire to negotiate with USSR, but will stand firm with NATO allies against Soviet pressure.

2–4—North Atlantic Council meets in Washington; restates determination to uphold freedom of West Berlin and West's rights and duties there.

4—Federation of Mali, linking Senegal and Soudan, comes into being, with Modibo Keita as premier.

9—Seven astronauts are named by National Aeronautics and Space Administration to undergo training for space flights (Project Mercury).

Frank Lloyd Wright dies at Phoenix, Ariz., aged 89.

13—Discoverer II satellite is first of Discoverer series to be launched into polar orbit in attempt (unsuccessful) to recover capsule from space.

President Eisenhower, in letter to Soviet Premier Khrushchev, calls for Soviet acceptance of "on-site inspection" of nuclear test ban, or, as step toward total ban, to agree to banning of tests up to 50 kilometers altitude.

15—John Foster Dulles resigns as secretary of state because of illness.

22—Christian A. Herter is sworn in as secretary of state.

23—Chinese Communists claim to have dispersed rebels in southeast Tibet and sealed border to India.

Soviet Premier Khrushchev rejects President Eisenhower's proposals of April 13 on nuclear test ban.

25—St. Lawrence Seaway is opened to traffic.

27—Liu Shao-chi succeeds Mao Tse-tung as chairman of Chinese People's Republic.

29–30—Foreign ministers of U.S., Britain, France, and West Germany, meeting in Paris in preparation for Big Four foreign ministers conference, agree on "package proposal" on Germany.

MAY

1—President Sékou Touré of Guinea and Prime Minister Kwame Nkrumah of Ghana sign draft agreement in Conakry, Guinea, for Union of Independent African States.

11—Foreign ministers of U.S., USSR, Britain, and France open conference at Geneva, with representatives of East and West Germany present as advisers.

21—UAR detains Danish freighter *Inge Toft* in Suez Canal and orders unloading of Israeli cargo.

24—John Foster Dulles dies in Washington, D.C., aged 71.

28—Two monkeys (Able and Baker) are recovered safely in Atlantic from nose cone of Jupiter rocket which reached altitude of 300 miles.

JUNE

1—Tunisian President Habib Bourguiba signs new constitution establishing presidential-type republic.

3—New constitution becomes effective in Singapore, ending status as British crown colony.

4—Cuban agrarian reform law is promulgated, providing for state appropriation of large landholdings.
Howard Green is named Canadian secretary of state for external affairs.
West German Chancellor Adenauer reverses his decision (revealed on April 7) to relinquish chancellorship.
8—At Big Four foreign ministers conference in Geneva, West presents general terms for West Berlin settlement, including proviso that Western powers retain rights granted in Occupation Statute of 1945.
9—At Geneva conference, Soviet Foreign Minister Gromyko rejects West's terms for West Berlin settlement, and demands that West end its occupation.
18—Queen Elizabeth II and Prince Philip arrive in St. John's, Newfoundland, to begin six-week tour of Canada.
19—Senate rejects nomination of Lewis L. Strauss as secretary of commerce.
26—Queen Elizabeth II and President Eisenhower dedicate St. Lawrence Seaway at St. Lambert, Quebec.
27—Queen Elizabeth II and Vice President Nixon dedicate St. Lawrence hydro project at Massena, N.Y.
29—Soviet First Deputy Premier Frol R. Kozlov opens Soviet Exhibition at Coliseum in New York.
30—Lewis L. Strauss resigns as secretary of commerce.

JULY

2—Russians fire 4,400-pound payload, containing two dogs and a rabbit, into upper atmosphere; animals are recovered safely.
5—Indonesian President Sukarno issues decree restoring 1945 Constitution and dissolving Constituent Assembly.
Saar is economically integrated with West Germany.
Israeli Premier David Ben-Gurion and cabinet resign on issue of sale of arms to West Germany.
15—Some 500,000 steelworkers go on strike, halting greater part of U.S. steel output.
17—Cuban President Urrutia resigns in dispute with Premier Castro over Communist influence in government.
21—Frederick H. Mueller is named secretary of commerce.
22—Iraq government announces quashing of revolt (begun on July 15) in Kirkuk area.
24—Vice President Nixon opens American National Exhibition in Moscow; Nixon and Soviet Premier Khrushchev engage in informal debate.
30—Laos reports that former Pathet Lao guerrillas have reopened attacks on posts in Sam Neua Province.
31—Indian President Rajendra Prasad issues proclamation taking over state government of Kerala and ousting Communist regime.

AUGUST

1—Vice President Nixon, in radio-television address from Moscow, defends U.S. foreign policy and way of life; bids Soviet Premier Khrushchev direct talents toward improvements at home instead of seeking to expand communism abroad.
5—Big Four foreign ministers conference in Geneva adjourns indefinitely, without agreement.
7—Explorer VI satellite is launched into orbit with apogee of 26,383 miles.
12—High schools in Little Rock, Ark., reopen on desegregated basis.
12–18—Foreign ministers of 21 American states confer in Santiago, Chile; sign Declaration of Santiago, censuring dictatorial regimes but condemning efforts by other governments to overthrow them.
19—Malayan elections result in victory for Alliance Party, pro-Western group led by Tengku Abdul Rahman.
21—Hawaii is proclaimed 50th state by President Eisenhower in Washington.
26—President Eisenhower arrives in Bonn to begin 12-day visit to Germany, Britain, and France.
Chinese Communist Party declares that claims for 1958 production gains in China were greatly overstated; adopts reduced goals for 1959.
28—USSR states it will not conduct nuclear weapons tests as long as West does likewise.
Indian Prime Minister Nehru charges that Chinese Communists have conducted aggressive raids on Indian territory along Tibetan border.
28–29—President Eisenhower visits Queen Elizabeth II at Balmoral, Scotland.

SEPTEMBER

3—Communist China, in note to India, charges India with aggression in border areas.
4—Laos asks U.N. to send emergency force to help defend Laos against "aggression" by North Vietnam.
9—Dalai Lama calls for U.N. action against Chinese Communist oppression in Tibet.
13—Soviet Lunik II space rocket strikes moon at 9:02 P.M. (Greenwich Civil Time) after flight of 36 hours. President Eisenhower signs Labor Reform Act of 1959, aimed at curbing abuses by unions.
15—Maj. Gen. George P. Vanier takes office as governor general of Canada.
15–27—Soviet Premier Khrushchev in U.S. for tour and official talks; visits Washington, New York, Los Angeles, San Francisco, Des Moines, and Pittsburgh.
16—French President de Gaulle, in Paris address, offers Algerians right to choose independence, integration with France, or autonomous federal regime associated with France.
18—Khrushchev, in address to U.N. General Assembly, calls for complete disarmament, except for police units, within four years.
Vanguard III satellite is launched into orbit.
26—Ceylonese Prime Minister S.W.R.D. Bandaranaike dies in Colombo of wounds inflicted by assassin.
26–27—Typhoon Vera sweeps across central Honshu, Japan, leaving 4,464 killed and several hundred missing.
27—Khrushchev and Eisenhower end three-day talks at Camp David, Md.; agree on new talks on Berlin issue and expansion of U.S.–USSR exchange program.
30—Khrushchev arrives in Peking for four-day visit during Chinese Communist regime's 10th anniversary celebration.

OCTOBER

4—USSR launches Lunik III "interplanetary station" to provide information on outer space.
7—Lunik III takes first photos of far side of moon.
Premier Kassem of Iraq wounded in assassination attempt.
8—Prime Minister Macmillan's Conservative Party wins overwhelming victory in British elections.
9—President Eisenhower invokes Taft-Hartley Act in steel strike.
13—Explorer VII satellite is launched into orbit.
16—Gen. George C. Marshall dies in Washington, aged 78.
20—Indian border police and Chinese Communist force clash in Ladakh; 9 Indians killed, 10 captured.
26—At mass demonstration in Havana against U.S. "aggression," Premier Castro charges U.S. allowed bombing planes to take off from U.S. territory.
30–31—Belgian-led troops clash with African nationalists in Stanleyville, Belgian Congo; 70 killed.

NOVEMBER

2—Charles Van Doren tells House Special Committee on Legislative Oversight that his role as contestant on TV quiz show in 1956–57 was "fixed."
3—Israeli elections result in victory for Premier Ben-Gurion's Mapai Party.
6—U.N. investigating subcommittee reveals it found no clear evidence indicating direct participation by North Vietnamese troops in Laotian fighting.
7—Supreme Court upholds Taft-Hartley Act 80-day injunction against steel strike; workers return.
20—Ministers of Britain, Sweden, Norway, Denmark, Austria, Switzerland, and Portugal, meeting in Stockholm, initial convention for European Free Trade Association (Outer Seven).
30—János Kádár, Hungarian Communist Party secretary, says Soviet troops will remain in Hungary as long as international situation makes it necessary.

DECEMBER

1—U.S., USSR, and 10 other nations sign treaty in Washington to reserve Antarctica for scientific and other peaceful purposes.
Britain and UAR resume diplomatic relations.
Thomas S. Gates, Jr., named secretary of defense, succeeding Neil H. McElroy.
3–22—President Eisenhower makes 22,370-mile goodwill tour of three continents, visiting Italy, Turkey, Pakistan, Afghanistan, India, Iran, Greece, Tunisia, France, Spain, and Morocco.
4—Rhesus monkey (Sam) is sent 55 miles into space in rocket and recovered safely in Atlantic.
12—U.N. General Assembly elects Poland to Security Council seat, in compromise whereby Poland is to resign at end of 1960 in favor of Turkey.
13—Archbishop Makarios III is elected president of Cyprus.
17—Pope John XXIII installs seven new cardinals (including two Americans) in Vatican ceremonies.
19—Western and Eastern scientists disagree on controls for underground nuclear tests; Geneva conference on nuclear test ban recesses until 1960.
19–21—Eisenhower, Macmillan, de Gaulle, and Adenauer confer in Paris and Rambouillet; communiqué announces invitation to Khrushchev for summit talks in Paris, early in 1960.
20—Local elections take place in Belgian Congo as first step toward self-rule; nationalist boycott is effective in Léopoldville.
22—President Eisenhower, in talks with Moroccan King Mohamed V in Casablanca, agrees to U.S. evacuation of military bases by end of 1963.
26—Gov. Nelson A. Rockefeller announces withdrawal from race for Republican presidential candidacy; says he will not accept vice presidential nomination.
30—Khrushchev accepts Western proposal for opening of summit talks in Paris on May 16, 1960.
U.S.S. *George Washington*, first of new class of nuclear submarines capable of firing Polaris missile, is commissioned at Groton, Conn.
30–31—Violence in Douala, French Cameroons, prior to inauguration of independence (on Jan. 1, 1960) results in about 30 persons killed.

PART 2 . . Chronological Index of the Year's Events

ON the following pages are indexed the principal world events of 1959. Main subject headings are indexed in alphabetical order, while specific events under each subject heading are listed chronologically (in order of their occurrence). Articles on many of the persons, countries, organizations, and other subjects may be found in the main text of this volume.

The Chronological Index is intended primarily to aid the reader in finding the dates on which the most important events of 1959 occurred. It is, therefore, a selected list of the year's most significant events, rather than a complete list of all events under all subject headings, though it does serve also as a guide to the year's important developments in any subject, particularly in the major countries.

In many instances events have been listed under both the general subject headings and under the specific names of the events or persons concerned; for example, the dedication of the St. Lawrence Seaway by President Eisenhower and Queen Elizabeth II on June 26 is covered under the headings EISENHOWER, ELIZABETH II, and ST. LAWRENCE SEAWAY AND POWER PROJECT. In other instances, events concerning persons whose names are less familiar to most readers may be found under the name of the country or general subject involved. The outstanding United States diplomatic and other appointments are listed under the heading UNITED STATES. Cross-references used herein refer only to headings within this Index.

ACADEMY AWARDS—See MOTION PICTURES

ACCIDENTS AND DISASTERS

Aviation

West German Lufthansa Super-Constellation crashes near Rio de Janeiro, Brazil; 36 killed, **Jan. 11**

Twin-engine Austral Airlines plane crashes in sea at Mar del Plata, Argentina; 51 killed, **Jan. 16**

American Airlines Electra turboprop airliner crashes into East River, New York City; 65 killed, **Feb. 4**

Capital Airlines Viscount airliner explodes in thunderstorm near Baltimore, Md.; 31 killed, **May 12**

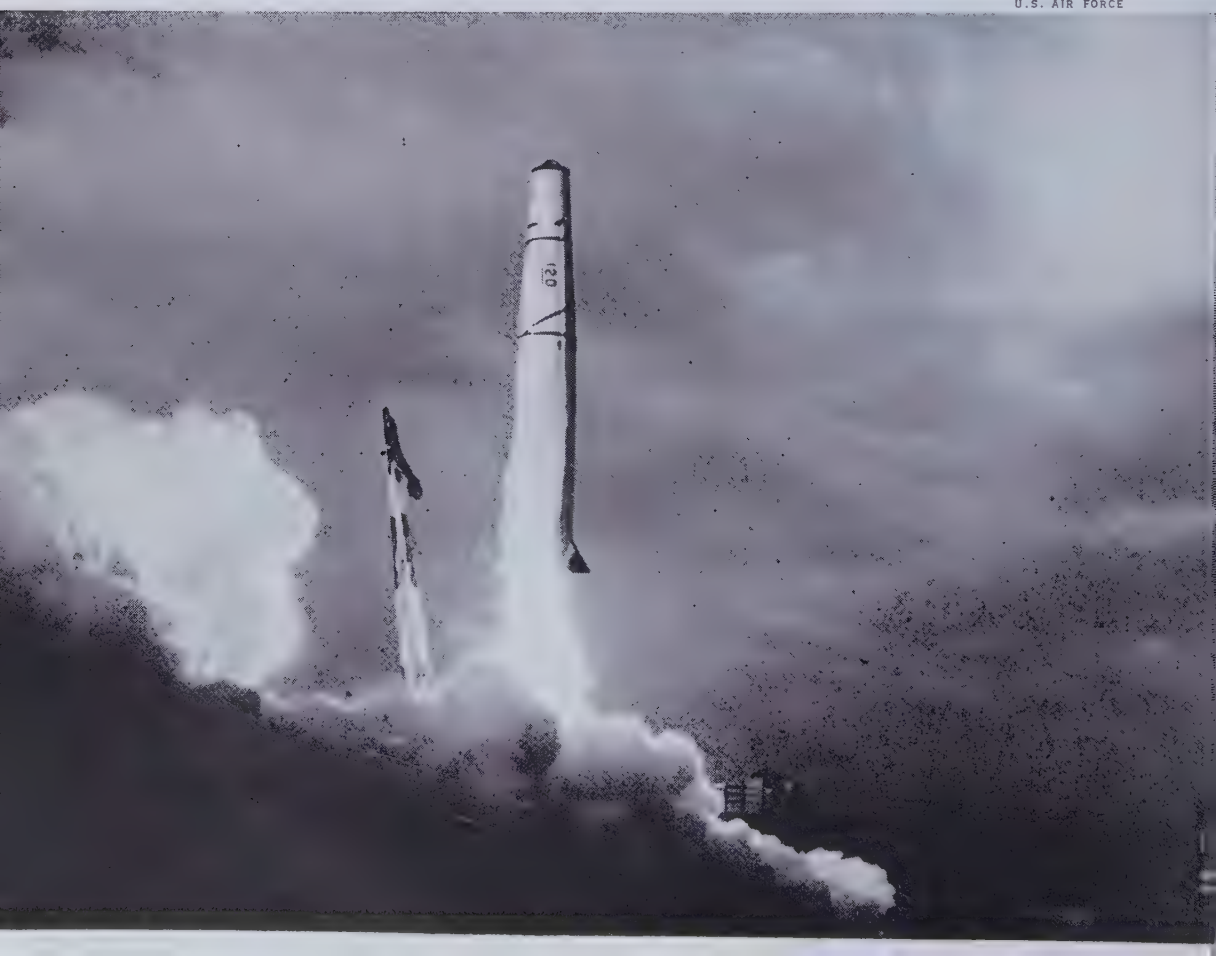
Symbolic of the growing power of United States military missiles, an Air Force Thor IRBM thunders aloft from Cape Canaveral in a test flight. The Thor, which can carry a thermonuclear warhead 1,500 miles, went into full production in 1959 and was deployed at three bases in Great Britain. Several other missiles achieved operational status during the year.

U.S. AIR FORCE



THE AMERICANA ANNUAL 1960

ABRASIVES. According to the U.S. Bureau of Mines, United States sales of abrasive materials (natural and artificial) declined sharply in quantity and value in 1958. Output of natural abrasives in 1958 was down 12% in tonnage and 18% in value. Sales of grinding wheels decreased 25% in value, and coated abrasives, more than 10%.

Data on United States production and imports of major abrasives in 1957 and 1958 are shown in the following table.

ABRASIVES IN THE UNITED STATES
(In short tons, unless otherwise indicated)

Type and category	1957	1958
Natural:		
Grinding and polishing sand	1,911,218	1,547,000
Quartz (crude, crushed, and ground)	269,178	234,516
Garnet	9,776	10,035
Emery	11,893	7,687
Tripoli	50,717	47,044
Pumice (abrasive only)	17,241	26,000
Grindstones	1,505	852
Tube-mill liners	1,440	...[1]
Grinding pebbles	2,902	1,985
Manufactured:		
Silicon carbide	124,688	110,456
Aluminum oxide	228,511	122,868
Metal abrasives	131,503	101,159
Imports:		
Industrial diamonds (carats)	12,220,000[2]	9,501,000
Corundum	4,104	4,685
Emery	1,334[2]	12
Pumice	35,182[2]	38,613
Silicon carbide	84,040	73,134
Aluminum oxide	192,778	81,214

ACADEMIES AND ASSOCIATIONS. See SOCIETIES AND ORGANIZATIONS.

ACCIDENTS. Accidental deaths in the United States during the first nine months of 1959 totaled 68,000, an increase of 2%—representing a loss of 1,200 lives—as compared with the corresponding months of 1958. More deaths were recorded in every accident classification except work, the figures for which did not change despite rising employment. The sharpest increase (3%) was in motor vehicle deaths, while public and home fatalities climbed 2% and 1%, respectively.

The 1958 accidental death toll in the United States was 91,000, an average of 52.5 persons killed per 100,000 population. This bettered the previous low rate of 55.8 in 1957, and was 30% lower than the average rate for the period 1928–58.

Accidents continued to be the fourth most important cause of death in the United States, exceeded only by heart disease, cancer, and cerebral hemorrhage. They were the leading cause of death among persons 1 to 36 years of age.

There were 9,655 accidental deaths in Canada in 1957 (the latest year for which complete figures are available). The population death rate was 57.7 per 100,000 population. As in the United States, accidents in Canada ranked fourth among all causes of death. Motor vehicle accidents were the most important type in Canada in 1957, resulting

Photo above: **Diamond Head forms the backdrop for this romantic setting at Waikiki Beach on the island of Oahu, Hawaii, 50th state of the Union. President Eisenhower proclaimed statehood for the former territory on Aug. 21, 1959.**

EWING GALLOWAY

in 3,694 deaths. The next most important types in terms of deaths were falls (1,569), drowning (1,230), burns (627), railroad (338), and poison gases (149).

The distribution was similar in the United States, except that the proportion of falls was higher and drowning lower. In the United States the 1958 death totals by classes were: motor vehicle (37,000), home (27,000), public (16,500), and work (13,300). In addition to the 91,000 deaths, accidental injuries totaled 9,100,000, including about 335,000 which brought some degree of permanent impairment.

ACCIDENTAL DEATHS IN THE U.S., 1950–59

Year	Total[1]	Motor vehicle	Public non-motor vehicle	Home	Work
1950	91,249	34,763	15,000	29,000	15,500
1951	95,871	36,996	16,000	30,000	16,000
1952	96,172	37,794	16,000	30,500	15,000
1953	95,032	37,955	16,500	29,000	15,500
1954	90,032	35,586	15,500	28,000	14,000
1955	93,443	38,426	15,500	28,500	14,200
1956	94,780	39,628	16,000	28,000	14,300
1957	95,307	38,702	17,500	28,000	14,200
1958	91,000	37,000	16,500	27,000	13,300
1958 (Jan.–Sept.)	66,700	26,270	12,900	19,600	10,000
1959 (Jan.–Sept.)	68,000	27,140	13,200	19,700	10,000

[1] Duplications between motor vehicle, work, and home accidents are eliminated in the "Total" column. Deaths of military personnel are assigned to motor vehicle, public non-motor vehicle, and home accidents, according to the type of accident.

Source: Total deaths and motor vehicle deaths, 1950 to 1957, are National Office of Vital Statistics totals. All other figures are National Safety Council estimates based on data from the National Office of Vital Statistics, state and city health departments and traffic authorities, and other sources.

Accidental deaths and injuries are estimated to have cost the United States $12.1 billion in 1958. These costs include wage losses, medical fees and hospital expense, overhead costs of insurance, property damage in motor vehicle accidents and fires, and property destroyed or production lost due to work accidents.

The most critical part of the accident scene—the highway—grew worse in 1959. After almost two years of steady improvement, the death trend turned upward as the nation emerged from the 1958 economic recession and travel boomed. The National Safety Council, noting a pattern apparent from previous economic cycles, warned of a record toll in prospect for the year. However, by late summer the trend was halted and the curve actually turned downward again. With travel continuing to increase, the mileage death rate fell to the lowest point on record.

M. E. HORNER,
National Safety Council.

ADEN. A British colony and two British protectorates in the southern Arabian Peninsula. The Colony of Aden consists of two rocky peninsulas on the south coast of Arabia about 100 miles east of Bab el Mandeb. The island of Perim in Bab el Mandeb (5 square miles) is also included. Aden Colony has an area of 75 square miles and a population (est. 1957) of about 152,000. The Kuria Muria Islands (30 square miles) and Kamaran Island (22 square miles) constitute dependencies.

Political Divisions.—Western Aden Protectorate and Eastern Aden Protectorate are bounded by Aden Colony, the sultanate of Muscat and Oman, the imamate of Yemen, and the "empty quarter" claimed by Saudi Arabia. The Eastern Protectorate (67,000 square miles; estimated population, 350,000) consists of seven states: the Qu'aiti state of Shihr and Mukalla; the Kathiri state of Sai'un; the Mahri sultanate of Qishn and Socotra; the Wahidi sultanates of Balhaf and of Bir 'Ali; and the sheikdoms of Irqa and Haura. The first two states comprise the district known as the Hadhramaut and are the best organized. The sultan of Shihr and Mukalla is the recognized chief of the protectorate. All rulers have protective treaties with Great Britain, which advises the rulers through a British agent residing at Mukalla.

Western Aden Protectorate (45,000 square miles; estimated population, 400,000) consists of 18 states which have protective treaty arrangements with Great Britain. The most progressive state is the sultanate of Lahej, which possesses a constitution vesting legislative power in the sultan and a 21-member Legislative Council. Six of the states—the amirates of Baihan and Dhala, the sheikdom of Upper Aulaqi, and the sultanates of Audhali, Fadhli, and Lower Yafa—formed the Federation of the Arab Amirates of the South on Feb. 11, 1959. The federation was governed by a 6-member Supreme Council elected by a Federal Council composed of 6 members from each state. A seventh member, the sultanate of Lahej, joined the federation on Oct. 5, 1959.

Government.—The British governor of Aden Colony (Sir William Henry Tucker Luce, appointed in 1956) also serves as commander-in-chief. He is aided by a 10-member Executive Council, composed of 3 ex-officio, 4 elected, and 1 nominated members; and a 23-member Legislative Council, which includes 12 elected and 6 nominated members. Four elected members and one nominated member of the Legislative Council are members of the Executive Council and have responsibilities for certain departments of the government. Justice in the colony is administered by a Court of Small Causes for civil suits, by magistrates for criminal procedures, and by a Supreme Court with unlimited jurisdiction.

Education.—In 1959 there were 35 primary schools and 16 intermediate schools with a combined enrollment of 10,416 pupils in the colony. Other schools include a technical institute, 4 boys' and 3 girls' secondary schools, and 2 teacher-training centers. The protectorates had 60 primary and 8 intermediate schools in 1959. In addition, 57 students attended higher educational institutions outside the state at government expense.

Economy.—Aden is one of the principal ports of the Commonwealth of Nations and is important as an entrepôt serving the entire Arabian area. In 1958 over 5 million tons of bunker fuel oil valued at over $72 million were supplied by British Petroleum Refinery (Aden), Ltd., and by Caltex Oil (Aden), Ltd., and Standard Vacuum (East Africa), Ltd. At Aden and Little Aden there are 30 berths for ships and 4 floating docks. In 1958, 6,286 ships with a total tonnage of 27,594,328 called at Aden. Exports in 1958 were valued at £63,497,937, and imports at £71,771,662. Traditional trade was mainly in cotton piece goods, grains, coffee, hides, tea, gums and resins, and cheap consumer goods. In recent years improved communications throughout the region have had a deleterious effect on Aden's entrepôt trade, since many smaller ports now trade directly with the outside world.

Revenues for Aden Colony in 1958–59 were estimated at £4,690,550; expenditures, at £4,452,750. The colony is served by Aden Airways (an associate of British Overseas Airways Corporation), which operates scheduled services to Aden protectorates, Arabia, and Africa, and by nine other international airlines. In 1958, 8,048 flights were recorded and a total of 85,014 passengers were carried. A cable and wireless network connects Aden by telephone with most countries of the world.

Principal Events, 1959.—On January 4, 12 moderate candidates were elected to the Aden Legislative Council in an election participated in by about 6,000 persons, or only 27% of the electorate. The election was boycotted by ardent Arab nationalists, particularly by the South Arabian League, which advocates the union of Aden with other Arab states. In April the weekly newspaper of the league was banned in Aden.

The signing of the constitution of the Federation of the Arab Amirates of the South took place on February 11 (see above, *Political Divisions*). British Colonial Secretary Alan Lennox-Boyd was present for the inaugural ceremonies, and in a speech on the occasion he promised eventual independence for the federation. In the face of Yemenite opposition, Britain promised to continue military and financial aid. Yemen refused to recognize the new federation.

Improved relations between Great Britain and the United Arab Republic during the year helped materially to reduce political tensions in Aden.

SYDNEY N. FISHER,
Professor of History,
The Ohio State University.

ADENAUER, Konrad, chancellor of the Federal Republic of Germany: b. Cologne, Germany, Jan.

5, 1876. After a period of enforced political retirement under the Nazis, from 1933 through World War II, he emerged as leader of the pro-Western Christian Democratic Party. He was elected chancellor of the republic in 1949, 1953, and 1957.

In 1959, an active year for the 83-year-old statesman, Adenauer caused excitement by proposing to relinquish the chancellorship. On April 7 he announced that he would accept his party's nomination in the July elections for the lesser position of president. On June 5, citing the worsened world situation as the reason for his change of heart, he withdrew from this candidacy and, over some party protest, announced that he would stay on as chancellor.

The Berlin question continued in 1959 to be the major problem facing Adenauer. On January 5 the Federal Republic rejected, as had other Western powers, Soviet proposals of "free city" status for West Berlin, with Moscow's control powers to be transferred to the Communist East German government by May 27. Throughout the year Adenauer remained adamant in opposing any concession on the city. He said on November 30: "The present four-power status of Berlin is still the best means of protecting the freedom of West Berlin." Originally opposed to admitting any discussion of the issue at the East-West summit meeting projected for early 1960, he agreed in mid-November, after talks in London with British Prime Minister Macmillan, to its inclusion as part of the overall questions of Germany's future and European security. The Berlin question was high on the agenda of the December 19–21 meeting in Paris of Adenauer, de Gaulle, Macmillan, and President Eisenhower, following the latter's tour of 11 countries in Europe, Asia, and Africa.

Although international problems affecting Germany remained unresolved, the domestic situation in 1959 gave Adenauer reason for satisfaction. A study prepared by the Institute of German Industry showed that in the ten years of his chancellorship the country's industrial production had tripled and that those unemployed had decreased from 8% of the work force in 1949 to only 1% in the fall of 1959.

ADULT EDUCATION. See EDUCATION and the Index entry, *Adult Education.*

ADVANCED RESEARCH PROJECTS AGENCY. Established by directive of the secretary of defense on Feb. 7, 1958, the Advanced Reseach Projects Agency (ARPA) served the Department of Defense in 1959 as planner and manager of advanced research and development in the high-priority fields of military space technology, ballistic missile defense, solid propellant technology, and materials. In carrying out these functions, ARPA worked with the Army, Navy, and Air Force.

In accordance with long-range plans made when ARPA was created, the Department of Defense announced on Sept. 23, 1959, that it was relieving ARPA of most of its military space projects and restoring them to the individual services, particularly to the Air Force. The announcement said that ARPA would continue as a permanent agency within the Department of Defense, and would retain its assignments in the missile defense, solid propellant, and materials programs.

Military Space Technology.—The development of a military space program was a major objective of ARPA in 1959. Two important military space projects reached flight test status. Test flights were conducted under Project Discoverer, designed to overcome such significant challenges as satellite stabilization and control in orbit, capsule ejection from outer space, and the recovery of the capsule at a predetermined time and place. The first test flight in a satellite navigation project was conducted with the launching of Transit I.[1] Subsequent launches are designed to provide an all-weather system through which submarines, surface craft, and aircraft can employ a navigation satellite to determine their positions accurately.

During 1959 work was initiated or continued on other military satellite programs to have far-reaching impact on national security. Nearing space flight test status were Projects Courier, for satellite communications, and Midas, for satellite early warning against ballistic missile attack.[2]

In support of these military space applications, ARPA sponsored varied research and development for advanced systems of propulsion, guidance and control, space communications, and tracking. The Saturn clustered booster, which consists of eight ballistic missile-type engines, approached test status. This booster, having 1.5 million pounds of thrust, will, with upper stages, launch a 28,000-pound space station into a 300-mile orbit.

Beyond such directly supporting research, ARPA in 1959 initiated "blue sky" exploratory work in space-oriented areas ranging from feasibility investigation of a rocket propelled by controlled nuclear detonations to solar power research. Research efforts for space propulsion and guidance were undertaken in connection with development of a maneuverable, recoverable space vehicle.

All of the programing in military space technology was predicated upon the belief that, during the next ten years, imaginative use of the space around the earth may provide elements of national security and power heretofore unachieved by any nation. (See also SPACE FLIGHT.)

Ballistic Missile Defense.—More than 50 separate programs were undertaken in 1959 to obtain the crucial information necessary for design of an effective system for ballistic missile defense. These programs seek to define the missile threat, to find improved methods for early warning, for identification and discrimination of the incoming warhead, and for kill mechanisms and data processing. As part of this effort, ARPA explored the requirements of the 1965–80 time period, sponsoring studies leading to development of antimissile and antisatellite systems beyond our present capability. (See also MISSILES.)

Solid Propellant Technology.—Solid propellants enjoy an important position in the defense posture. An increase of 20 per cent in the useful energy of solid propellants will double the warhead-carrying potential of tomorrow's solid-engine intercontinental ballistic missile. To achieve such a breakthrough, more than 50 basic research contracts were awarded to industrial, foundational, academic, and governmental laboratories and institutions.

Materials.—A new area of responsibility was assigned in mid-1959, namely, a basic research project for the discovery of (1) superstrength materials for tanks, guns, rockets, missiles, and space vehicles; (2) structural materials resistant to vast temperature extremes; and (3) new materials for electronic and electrical circuitry operating at high temperatures. Under this project, contracts were awarded to selected American universities.

[1] Transit I was launched in September 1959 but failed to orbit.

[2] Project Samos, a reconnaissance satellite system, along with Projects Discoverer and Midas, were transferred to the Air Force on Nov. 17, 1959. The Army and Navy, respectively, were scheduled to become operational developers of Projects Courier and Transit at a later date (probably in 1960), although program management of these two projects would remain with ARPA.

Administration.—Under the director (Roy W. Johnson) and the deputy director (Maj. Gen. Don R. Ostrander), there were in 1959 an assistant director for administration (Lawrence P. Gise) and three operating division directors for policy and planning (William H. Godel), technical operations (Nicholas E. Golovin), and financial management and reports (Wilbur W. Bolton, Jr.). In addition to the management staff, the ARPA director had immediately available for scientific and technical advice a chief scientist (George P. Sutton), who also directed the Advanced Research Projects Division of the Institute for Defense Analyses, a nonprofit corporation under contract to provide scientific and technical advice to the Department of Defense.

In 1959, the total ARPA staff numbered approximately 100 persons, half of whom were scientific contractor personnel of the Advanced Research Projects Division. With the exception of a government representative in the West Coast Field Office in Santa Monica, Calif., all of the personnel were stationed in the Pentagon, Washington, D.C.

ROY W. JOHNSON,
Director, Advanced Research Projects Agency.[3]

ADVERTISING. Advertising volume in the United States, after dropping the year before, turned upward again and climbed to a record level in 1959. Spurred by a quickening economic pace, investments in national and local media soared to about $11.1 billion, a 7% increase over the $10.3 billion spent in 1958. National advertising recorded a 7% gain, up from $6.3 billion to $6.8 billion. Local advertising climbed even faster and was up 8%, from $4.0 billion in 1958 to $4.3 billion in 1959.

The return to a record-setting pace in 1959, despite the national steel strike, accented the severe impact that the recession had had on advertising in 1958. In that year, advertising volume declined about 0.1% below that of 1957. It was the first time in 15 years that advertising investments had fallen below the previous year's figure.

The impressive rise of advertising volume before and since the 1958 decline is recorded in the accompanying compilation of annual advertising investments prepared by McCann-Erickson, Inc., for the magazine *Printers' Ink* (volume is expressed in millions of dollars):

Year	Volume	Year	Volume	Year	Volume
1940	2,088	1947	4,260	1954	8,164
1941	2,236	1948	4,864	1955	9,194
1942	2,156	1949	5,202	1956	9,905
1943	2,496	1950	5,710	1957	10,311
1944	2,724	1951	6,426	1958	10,302
1945	2,875	1952	7,156	1959	11,055*
1946	3,364	1953	7,755		

* Preliminary

The volume increase in 1959, despite its significant size, was small comfort to those elements of the advertising industry besieged, as never before, by public suspicion and reproach. The television quiz scandal (see RADIO AND TELEVISION) and the subsequent investigations focused attention on the ethics of all advertising and the integrity of every advertiser's paid commercial messages, in print as well as broadcast media.

The Federal Trade Commission was particularly vigilant during 1959 in branding "fraudulent" any advertisement which it believed did not meet the standards of truthfulness and honesty. Other government and private agencies, notably Better Business Bureaus, were also active in scrutinizing advertising for the protection of consumers.

Though only a minority of the industry was responsible for any untruthfulness, almost all advertisers recognized their duty to take corrective measures or face the alternative of new restrictive government regulations. So seriously was the problem regarded that the Association of National Advertisers, the industry's leading advertiser group, called on every member "to take immediate and complete inventory" of all present and planned advertising to test its honesty in both content and presentation.

Network television, through the quiz show scandal, was the major immediate target of the public reaction against untruthfulness in advertising-carrying media. Nevertheless, television advertising continued to grow, with no decrease in the growth rate of recent years. During 1959, advertisers invested about $786 million in network television time and talent costs, an increase of 11% over the $709 million spent in 1958. National spot television billings scored a similar rate of growth, from $397 million to about $439 million.

Advertiser interest in radio, which sagged with the advent of television a decade ago but then rebounded, starting in 1957, continued on the upswing in 1959, if only slightly. National spot radio investments recorded a gain of about 5%, up from $190 million in 1958 to $199 million in 1959. Network radio, however, continued its slump. It recorded a loss of about 12% in advertiser time and talent investments, from $58 million to close to $51 million in 1959. Overall, radio gained about 1% for the year.

General and farm magazines, which suffered some of the most severe setbacks during the recession of 1958, more than made up the losses in 1959. Advertising volume, including space and production costs, jumped 11%, from $767 million in 1958 to about $850 million in 1959. The previous high, set in 1957, had been $814 million. (See also MAGAZINES.)

Business papers and trade magazines fared less well. They increased their advertising revenues about 6%, from $525 million to $555 million in 1959. Volume in 1957, however, had been almost $568 million.

Besides business papers, only outdoor advertising failed to pass a previous high in volume. National advertising investments in the outdoor medium scored a negligible gain of less than 1% from 1958 to 1959, up from $129 million to about $130 million. National billboard advertising, however, had been slipping since 1956 when a record $136 million was invested.

A 7% increase was recorded for national advertising in newspapers. Space and production investments climbed from $769 million in 1958 to about $820 million in 1959. (See also NEWSPAPERS.)

Also noting gains were advertising via direct mail, up from $1.58 billion to $1.64 billion; transportation cards, up from $23.5 million to $25 million, and point-of-purchase displays, up from about $1.0 billion to approximately $1.1 billion.

SELWYN FEINSTEIN,
Associate Editor, "Printers' Ink."

AERONAUTICS. The United States aircraft industry went through a disturbing year in 1959, and there was every indication that 1960 might be worse.

The defense budget for the fiscal year 1960 provided fewer dollars for missiles and related procurement than in fiscal 1959 ($3,624,000,000 versus $4,154,000,000) and more money for aircraft and related procurement ($6,057,000,000 versus $5,955,000,000), but these figures were deceptive. A large part of the missile money went into research and development and preproduction costs, whereas the bulk of the aircraft money was for actual hardware. There are few new aircraft coming along behind those now in production, whereas many new and highly expensive missiles and space vehicles will be coming into production in the months and years just ahead. Furthermore, by the end of the year a number of aircraft programs were being or soon would be subjected to stretchouts, cutbacks and cancellations, and the procurement picture was expected to change sharply as a result.

At the end of 1959, employment in the United States aircraft plants was down to about 740,000, compared with 840,000 at the beginning of the year, and more layoffs appeared in prospect.

Commercial Transports. *Boeing 707.*—The first United States–built jetliner, the Boeing 707, went into service at the end of 1958, and by late summer of 1959 the popular acceptance of jet travel

[3] On Oct. 17, 1959, it was announced that Johnson would resign as ARPA director as soon as a successor could be found. Dr. Charles L. Critchfield, who was named to the post in November, decided soon afterward that he would not accept the appointment.

was impressive. By the end of the year, Boeing Airplane Co. had delivered approximately 63 707's in four models (707–120, 707–220, 707–320, and 707–420 Intercontinental), and had 197 orders for the series. It showed its design for a turbofan jet swing-tail cargo version, the Model 735, and production was under way on a smaller passenger jet, the 720.

Douglas DC-8.—The second United States commercial jet, the Douglas DC-8, was awarded its Federal Aviation Agency (q.v.) certification on Sept. 2, 1959, and went into airline service later that month. Douglas has two versions of the DC-8, one (domestic) with Pratt & Whitney JT3 engines and one (intercontinental) with the more powerful Pratt & Whitney JT4 engines or the Rolls-Royce Conway bypass engine. All but 23 of the approximately 150 DC-8's sold by the end of 1959 were of the latter version. The JT4-powered DC-8 was certificated in December 1959. Meanwhile, Douglas drafted specifications for a smaller DC-9 jet transport for use on shorter airline routes, and also proposed an all-cargo version.

Convair 880.—The Convair 880 jetliner made its first flight in February 1959, and the company anticipated its certification by spring of 1960. The 880 carries 88 passengers in first-class and 110 in coach configuration in both its domestic and intercontinental versions. It cruises at 615 mph., making it the fastest commercial jet to date.

Convair 600.—Major assembly of the Convair 600 started in September 1959, and certification is expected by late 1960. American Airlines plans to introduce the turbofan transport, which is larger, faster, and more economical than the 880, early in 1961. (The company also announced plans to convert its entire fleet to turbofan engines.)

Turboprops.—In the turboprop field, the Lockheed Electra made its debut in airline service early in 1959, and by the end of the year more than 165 of the planes had been sold. The other United States–built turboprop, the Fairchild F-27, was certificated by the FAA in August 1959 for increased takeoff and landing weights. The Allison Division of General Motors brought out a turboprop adaptation of the Convair 340/440 series of twin-engine transport, which it named the Super Convair. By the end of 1959, approximately 62 jet transports and 185 turboprops had been delivered by United States manufacturers.

Other Developments.—Meanwhile, stepped-up deliveries of new turbojet and turboprop airliners were leaving airlines with numbers of piston-powered transports surplus to their needs, and the market for used aircraft fell sharply after mid-1959.

The International Civil Aviation Organization in 1959 set up a committee to study the financial, technical, and social impacts of proposed supersonic transports that would fly at 2,000 miles per hour.

Military Aircraft.—The United States ability-to-survive concept had two principal features in 1959: (1) a significant number of aircraft in the air at all times, bolstered by a ground alert and quick takeoff capability; and (2) wide dispersal of missile bases. In line with this strategy, the military services had approximately 35,000 aircraft in inventory, including six operational Mach 2 fighter and fighter/interceptor types and one operational Mach 2 bomber type.

Development continued through 1959 on a nuclear-powered bomber, but both the Pentagon and Congress showed reluctance to give this project a high enough priority and sufficient funds to have a flying aircraft available inside of four or five years.

Century Series.—In the so-called Century series (F-100, F-101, etc.) the McDonnell F-101B Voodoo became operational in late 1959. It is a two-seat, all-weather fighter/interceptor with exceptional climb performance and a speed of 1,500 mph. or better. Also becoming operational was the Convair F-106 Delta Dart. This high-altitude, all-weather supersonic interceptor is being produced in two models—the single-seat F-106A and the two-place F-106B. The Mach 2 Lockheed F-104 Starfighter not only remains a major weapon in the U.S. Air Force arsenal but will soon be in service with other nations friendly to the United States.

Republic Aviation's F-105 Thunderchief, Mach 2 successor to the F-84 Thunderstreak and the RF-84 Thunderflash, became fully operational with the Tactical Air Command in late 1959. The Air Force canceled production of the two-place F-105E and increased the number of single-place F-105D models to be built.

Northrop Aircraft's N-156F counter-air fighter made its first flight in July 1959. An outgrowth of the Air Force's T-38 jet trainer, it is designed to meet the needs of North Atlantic Treaty Organization nations for a Mach 2 supersonic fighter, with low manufacturing and operating costs, capable of operating from short runways or zero-length launchers.

North American Aviation's F-108 Rapier, a 2,000-mph. long-range interceptor, was canceled in September 1959 for budgetary reasons, reflecting the growing reliance on surface-to-air and air-to-air missiles for interceptor roles.

Navy Aircraft.—Due to become operational with the Navy in 1960 is the McDonnell F4H-1, a twin-jet, two-place, carrier-based fighter with a speed well in excess of Mach 2, which was chosen over Chance Vought's F8U-3. Also well along in development is the Lockheed P3V-1, an antisubmarine warfare patrol plane based on the civil Electra turboprop. Entering production was North American's A3J Vigilante, capable of carrying nuclear weapons; the Grumman A2F-1, a new attack plane, and the W2F-1 advanced early-warning aircraft. The Navy, after spending $400 million on the Martin P6M-2 SeaMaster jet seaplane, canceled the program in August 1959.

Bombers.—In the bomber category, with the Mach 2 Convair B-58 Hustler just becoming operational and the Mach 3 B-70 Valkyrie still far from completion, the nation's chief reliance throughout 1959 rested with the aging B-52 long-range and the B-47 medium-range bombers, together with the Douglas B-66B tactical bomber. First versions of the B-52G, which will carry the Hound Dog air-to-surface missile and later a planned ALBM (air-launched ballistic missile), were being purchased late in 1959.

The B-58, a strategic bomber-reconnaissance weapons system, reached operational status in late 1959 but fell victim to a budget cut that lopped eight planes off planned procurement and caused cancellation of a proposed B-58B with an improved engine.

Also affected by fiscal limitations was one version of the B-70, which would have been powered by a high-energy chemical (boron-based) fuel. The six-engine B-70, which uses existing jet fuel, has an uncertain future. A prototype of the 2,000-mph. bomber will be built for flight in 1963, according to present (1959) plans.

North American X-15.—The X-15 rocket-powered research plane, designed to carry a man to the fringe of space, attained an altitude of above 50,000 feet and a speed of more than 1,400 mph. during its first powered flight on Sept. 17, 1959. Tests through the remainder of the year progressed grad-

(*Left*) De Havilland Comet 4B, British jet passenger transport, made its initial flight in mid-1959.

BOAC

(*Right*) Tupolev Tu-114, the Soviet Union's new intercontinental jet transport.

SOVFOTO

ually toward the goal of taking a piloted aircraft to above 100,000 feet altitude. Built by North American Aviation for the Air Force, the X-15 is launched from beneath the wing of a B-52 "mother" plane at 38,000–40,000 feet.

Dyna-Soar.—Air Force indecision as to how best to proceed with development of the Dyna-Soar skip-glide bomber held the project almost at a standstill during most of 1959. A successor or follow-up to the X-15, Dyna-Soar is intended to boost a man into space with powerful rocket engines and return him to earth from orbital altitude in a glide. It will explore flight regimes between the Mach 6 speed of the X-15 and Mach 25. An experimental vehicle may be ready for test in the early 1960's. A manufacturing team headed by Boeing Airplane Co. was given responsibility for developing the Dyna-Soar vehicle, while another team headed by the Martin Co. was chosen to perfect propulsion equipment based on its Titan intercontinental ballistic missile.

Trainers.—United States military forces are moving steadily toward all-jet training for fledgling pilots. The Air Force's training is now done entirely with jets, and the Navy is evaluating an all-jet training program, using the Temco TT-1 primary jet trainer for its tests. The North American A2J, an all-purpose jet trainer, was in production for the Navy in 1959. Continuing in service are the Beech T-34A (Air Force) and T-34B (Navy) Mentor trainers and the Cessna T-37A intermediate trainer. The latter became the T-37B in late 1959, following installation of more powerful engines and new communications and navigation equipment.

Extensively tested in 1959 preparatory to becoming operational was the Northrop T-38 Talon, a twin-jet supersonic trainer powered by new high-thrust-to-weight engines. This plane will replace the Air Force's T-33 basic trainer. The Air Force chose the Lockheed JetStar over the McDonnell Model 119A in its competition for a small jet transport to be used as a navigation trainer. Powered by four Pratt & Whitney JT-12 lightweight turbojets, it has a cruising speed of 550 mph., range of 3,100 miles, and good short-field takeoff and landing capabilities.

STOL/VTOL Aircraft. Several STOL (short takeoff and landing) and VTOL (vertical takeoff and landing) aircraft made aviation news in 1959. The Air Force bought for evaluation purposes three Helio Super Couriers, its first VTOL aircraft. The tilt-wing Hiller X-18, largest VTOL aircraft in the Air Force development program, began flight tests in the fall; the Army had the Fairchild M-24 and several other experimental STOL aircraft under observation; and the Doak 16 ducted-fan VTOL accomplished successful in-flight transition from vertical to horizontal and back to vertical.

In the convertiplane category, Bell Helicopter Corporation's XV-3, under development for the Army, made numerous full and partial in-flight conversions, and became the first VTOL to shift gears in flight. Ryan Aeronautical's Model 92 Vertiplane, a Navy experimental vehicle, was damaged in a landing in 1959 but subsequently was repaired and returned to test flight.

Helicopters.—A highlight in the field of rotary wing aircraft in 1959 was the selection of Vertol Aircraft's twin-turbine YHC-1B Chinook helicopter to replace current obsolescent piston-powered Army transport helicopters. Developed from the commercial Model 107, but larger, the Chinook has two turbine engines, a rear loading ramp, and capacity for up to 40 troops. Production is due to begin in November 1960.

Another Vertol craft, the Model 76 VTOL/STOL helicopter, designated VZ-2 by the Army, was turned over to the National Aeronautics and Space Administration for extensive testing. The 4-place Cessna CH-1C, credited with a high degree of stability, received a type certificate from the FAA. Sikorsky Aircraft in 1959 first flew its S-61, a 25-passenger amphibious helicopter which will be delivered to airlines starting early in 1961. The company promised delivery of its turbine-powered S-62, also amphibious, early in 1960, and introduced the HSS-2 (military version of the S-61) to replace the HSS-1 antisubmarine warfare helicopter.

Kaman Aircraft Corporation's HU2K turbine-powered helicopter made its first flight in July 1959 and then underwent a full-scale flight test program. Deliveries to the Air Force of the Kaman H-43B

UNITED AIR LINES

Huskie, a six-or-more-place general utility helicopter, were begun.

Kellett Aircraft Corp. received FAA type certification for a new three-blade autogiro with freely rotating wing. Hughes Tool Company's two-place Model 269A also won FAA certification and was being tested by the Army under the designation YHO-2HU. Bell Helicopter Corp. installed a larger turbine engine in its HU-1 Iroquois, and undertook to build and test for the Navy two HUL-2's, a four-place utility helicopter said to have high performance capabilities. Three helicopter firms have made or are making studies for the Air Research and Development Command of the feasibility of a nuclear-powered helicopter with a 500,000-pound gross weight and speed of 200 mph. or more.

Utility and Light Planes.—Highlights of 1959 in the utility and light plane fields included: (1) provisional certification of the Grumman Gulfstream, a 370-mph., 10–19 passenger turboprop executive aircraft being produced at the rate of three a month; (2) receipt of the first commercial order for the Lockheed JetStar, and a decision to convert this twin-engine utility jet to a four-engine version for the corporate market in late 1960; (3) first flight of the Model 119, McDonnell Aircraft's four-engine utility jet trainer and transport; and (4) start of production of North American's twin-jet Sabreliner utility trainer, which the Air Force has ordered under the designation T-39 and which is adaptable for private and commercial flying.

New models of business and private aircraft put on the market in 1959 included the Cessna 210 high-wing, four-place, single-engine monoplane; Beech Aircraft's Super 18 executive transport and twin-engine Travel Air; the single-engine Mooney Mark 21; improved versions of the Piper Tri-Pacer and Piper Caribbean; and a new Cessna Model 407 four-place utility jet.

U.S. Commercial Air Traffic.—Passenger traffic of the domestic trunk airlines was 11% higher in the first six months of 1959 than in the like period a year earlier—13,408,880,000 revenue passenger-miles versus 12,061,167,000—and results for the second half were expected to be even better. Total revenue ton-miles flown in the first half of 1959 were 1,505,380,000, as against 1,393,649,000 in January–June 1958. Total operating revenues were up 16.1%, from $740,712,000 in the first half of 1958 to $859,968,000 in the comparable 1959 period. Operating expenses, however, rose only 12% in the 1959 period, totaling $801,060,000 as against $715,227,000 in the first six months of 1958. Net profit for the half-year was $29,549,000, a sizable advance from the $7,971,000 earned by the domestic lines in January–June 1958, and profits for the full year were expected to be close to a record for the industry.

The United States international airlines reported increases in both revenue passenger-miles (3,117,708,000 as against 2,759,652,000) and revenue ton-miles (481,110,000 as against 393,399,000) flown in the first half of 1959 as compared with the like period of 1958. Their revenues went up 10.9%, from $235,694,000 to $261,513,000, whereas operating expenses were only 7.4% higher —$260,333,000 in January–June 1959 as against $242,463,000 in the first half of 1958. Their net profit for the 1959 period was $4,238,000, compared with a net loss of $5,201,000 in the first six months of 1958.

SCHEDULED TRAFFIC OF U.S. AIRLINES

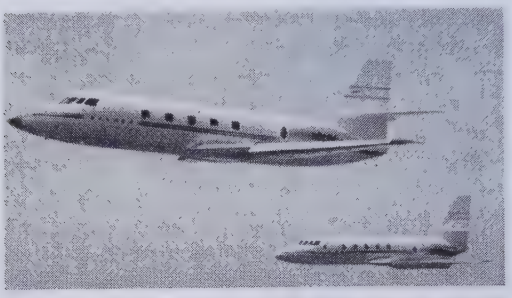
	Full year 1958	Jan.–June 1959
Domestic Trunk Airlines:		
Revenue passenger-miles	24,556,273,000	13,408,880,000
Revenue plane-miles	703,241,000	365,503,000
Freight ton-miles	241,028,000	132,220,000
Mail ton-miles	87,818,000	47,142,000
Express ton-miles	45,890,000	24,526,000
Total revenue ton-miles	2,871,360,000	1,505,380,000
U.S. Flag International Airlines:		
Revenue passenger-miles	6,523,124,000	3,117,708,000
Revenue plane-miles	173,130,000	79,357,000
Freight ton-miles*	134,380,000	70,343,000
Mail ton-miles	65,810,000	33,976,000
Foreign mail ton-miles	7,875,000	3,999,000
Total revenue ton-miles	871,185,000	481,110,000

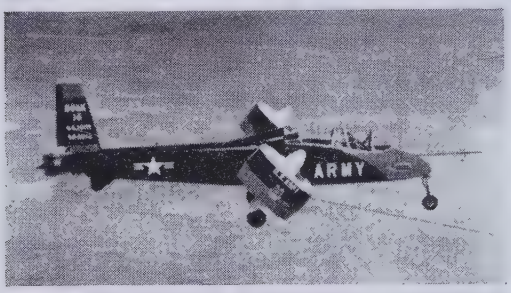
* Includes express ton-miles. (Source: Air Transport Association of America.)

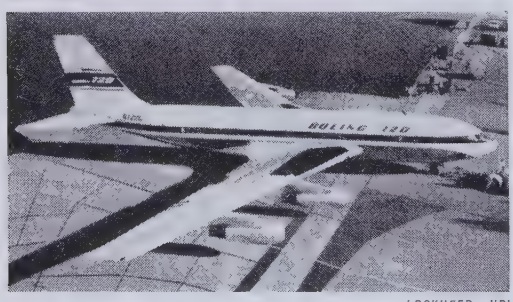
Canada.—Canada's aviation industry suffered a serious setback in early 1959, following cancellation of the Avro CF-105 supersonic interceptor, in which the government had invested $400 million. Within a few months approximately 25,000 workers were laid off at A. V. Roe Canada Ltd. and its Orenda Engines Division, and by subcontractors and suppliers.

Cancellation of the CF-105 left Canada reliant upon United States–built Bomarc and Lacrosse missiles for its air defense. Arrangements subsequently were made for Canadair Ltd. to build wings and ailerons for the Bomarc surface-to-air pilotless interceptor under subcontract from Boeing Airplane Co., Seattle, and other Canadian firms were invited to bid on production of other Bomarc components.

The CF-105 cancellation left the Royal Canadian Air Force with only the aging CF-100's with which to fulfill its NATO and NORAD (North American Air Defense Command) commitments. In July 1959 it was announced that 200 Lockheed F-104G's would be built under license in Canada for the RCAF, Canadair to build the airframes and Orenda the engines. The 1,400-mph. high-altitude interceptors will be used for strike reconnaissance missions and will be in operational service by late 1961.







LOCKHEED; UPI

(*Top*) Two Lockheed JetStars, prototypes of aircraft which will provide private executive jet travel. (*Middle*) Doak 16, experimental VTOL plane built for the Army, has rotating ducted fans which point up for vertical flight, turn ahead for forward flight. (*Bottom*) Boeing 720, designed for medium-range routes, came off assembly line in late 1959.

In the civil field, Canadair received from the Flying Tiger Line and Seaboard & Western Airlines an order for 15 CL-44 turboprop swing-tail cargo transports. The first CL-44 flew in late 1959, and airline deliveries will start in late 1960.

De Havilland Aircraft of Canada Ltd. improved the capability of its twin-engine STOL utility transport, the Caribou, and won United States certification for the plane in the fall of 1959.

The Air Transport Board of Canada in 1959 breeched for the first time its established policy of letting Trans-Canada Air Lines have sole operating rights across Canada and restricting Canadian Pacific Air Lines to international routes. CPA, which sought unrestricted operations across Canada, was granted one round trip a day between Vancouver and Montreal to connect with its international operations. TCA in late 1959 started its first jet service, using Douglas DC-8's powered by Rolls-Royce Conway bypass engines.

Great Britain.—The year 1959 will go down in the annals of the Society of British Aircraft Constructors as one of the best years—and one of the worst—it has experienced.

British industry shipped about $250 million worth of aircraft, aero engines, and other aviation products in the first half of 1959, a 14% gain over the previous six-month record achieved in the second half of 1958; and the export pace was maintained fairly well in the second half of 1959. However, most of the 1959 exports represented products long in development and orders placed one to four years earlier, and new aviation export products were not coming along in significant numbers. The result was that more than 10,000 aircraft workers were laid off in a year's time, and the industry was forced into a number of mergers and amalgamations.

In the field of commercial aviation, promising British developments include the Vickers Vanguard, the de Havilland DH-121, the Avro 748, and the Fairey Rotodyne. The Vanguard, a large turboprop transport, first flew in early 1959 and was due for certification in the spring of 1960. The Avro 748, due to fly early in 1960 and to be ready for airline delivery in the first half of 1961, is a 36–40 passenger, medium-range twin turboprop. The DH-121 is to be a short-haul jetliner, powered by three jet engines, carrying 75–97 passengers at 600 mph. Deliveries to British European Airways are expected to start in early 1964. The Rotodyne, due for delivery starting in 1964, is a 65-passenger VTOL airliner, but also has military potentialities as a flying-crane and troop transport.

Some promise was attached also to the Comet 4B jetliner, which first flew in mid-1959; the Argosy turboprop airfreighter, in which one United States operator has shown keen interest; the Britannic long-range turboprop cargo plane, due to be in production by the end of 1961; the Vickers-Armstrong VC-10 jetliner and a smaller VC-11 version; the Short S.C.1 five-jet VTOL; the Handley Page Victor bomber, and the Saunders-Roe P531 general-purpose five-seat helicopter.

The Saunders-Roe Hovercraft, a wingless craft which rides on a cushion of air, was flown across the English Channel from Calais to Dover on July 25, 1959, making the trip in 2 hours 3 minutes and hovering less than a foot above the surface of the water. Designated the S.R.N.-1, the ship is shaped like a flying saucer, in the form of an oval, 20 by 30 feet. Air is drawn in through a large funnel at its top and ejected under pressure at the bottom. Air jets at the side provide motion and steerage. Despite the Hovercraft's low speed (about 33 mph. in trials), its builders hope to develop the model for use in transport, especially over water.

Great Britain looked with some apprehension on the formation in 1959 of Air Union, a consortium of Alitalia, Air France, Lufthansa, and Sabena airlines (with other countries invited to join), formed to pool certain services and facilities and thus enable the airlines of those countries to compete more effectively with the large United States carriers and the Commonwealth group.

USSR.—The Soviet Union continued to press forward with missiles and astronautical developments in 1959, but most of its aeronautical achievements were in the field of civil rather than military aircraft.

Aeroflot, the Soviet airline, began to expand rapidly under a government policy aimed at blanketing the Soviet Union with new trunk air routes, a local airline network, and helicopter services. Under this policy, air travel is to become the primary method of passenger transport, with railroads and a river boat network devoted primarily to cargo. Another obvious aim is to provide a fast and politically secure network of communications between Moscow and the major capitals of the world. As a result, by mid-1959 Aeroflot had more civil airliners in service than any other nation in the world, and approximately 90 airports were being built or improved to take care of the fast-growing air transport volume.

It became apparent in 1959 that the Soviet Union had elected to drop further development of jetliners and concentrate largely on turboprop aircraft. Introduced in scheduled airline service in July was the AN-10 Ukrania, which carries 85 passengers and flies at more than 400 miles per hour. This aircraft is being stretched to a 100-passenger configuration in the forthcoming AN-10A, and an even larger version called the AN-16 is planned. Another airliner put into service by Aeroflot in 1959 was the Ilyushin IL-18 Moskva, powered by four turboprops. It carries 100 passengers.

Most publicized Soviet transport is the Tupolev Tu-114, also powered by four turboprops. This giant plane carries 120 passengers on intercontinental nonstop flights, 170 in normal domestic operations, and 220 on tourist-class flights. In some respects, it appears superior to the most advanced airliners operated in the free world. Meanwhile, the Soviet Union's first jetliner, the 52-passenger twin-jet Tu-104, continues in wide use, and two advanced versions, the 70-passenger Tu-104A and the 100-passenger Tu-104B, have been introduced.

If the Russians were doing much in the field of manned military aircraft in 1959, the results were not evident. Reported operational late in 1958 was a six-jet supersonic bomber (called "Bounder" by NATO), and an eight-jet version was reported in development. Work continued on development of a nuclear-powered aircraft, but the extent of progress was not known in the Western world. The T-4A, Soviet counterpart of the United States

Dyna-Soar skip-glide space research aircraft, was in flight test stage, and was reported capable of operating at a range of 12,000 miles and at an altitude of 160 miles.

France.—The French aviation industry marked its 50th anniversary in 1959 with an International Air Show in Paris which attracted 281 exhibitors from 14 countries and manifested a remarkable resurgence of French aviation.

Sud Aviation's Caravelle jet transport went into full airline service in 1959; six airlines had ordered 55 of them. The Caravelle has been officially certificated by the Federal Aviation Agency, and at least one United States airline is considering buying it. Also popular are Sud Aviation's Djinn and Alouette helicopters, with more than 500 of the latter sold through 1959. In addition, Sud is test-flying the SE 3200 Frelon, a three-turbine helicopter carrying up to 20 passengers, and is producing the SE 3160 Alouette III.

Nord Aviation has teamed with West Germany's Weser Flugzeugbau to develop a medium-range military turboprop transport to replace the obsolescent Noratlas. Nord also has joined three West German firms for the purpose of building a twin-turboprop military transport.

Breguet's principal activity for the past year has been development, in association with Piasecki Aircraft Corp. of the United States, of the 940/941, a four-turboprop STOL transport. The 940, also called the Integral, is a 7-ton transport that can land and take off in distances of 250–350 feet. The 941 will be a 20-ton version capable of carrying 40 passengers over distances of more than 600 miles at 235–250 mph. Breguet also has teamed with Sud Aviation, Britain's Rolls-Royce, the Netherlands' Fokker, and West Germany's Dornier to develop and produce a new patrol plane for the French Navy.

West Germany.—West Germany's aircraft industry, largely dormant since World War II, began a comeback in 1959. A major factor was the government's decision to order up to 400 multimission (fighter, fighter-bomber and reconnaissance) F-104 Starfighters, 300 of which are to be built in Germany under license from Lockheed Aircraft Corp.

West German firms also were to produce at least 60 Bell 47G-2 helicopters and 200 or more Fiat G-91 lightweight strike/reconnaissance fighters under license.

Convinced that Germany is to become a major arms producer for the Western defense alignment, a number of important United States manufacturers were reported to be buying into German aircraft companies in 1959, and others were reaching corporation agreements. The large influx of capital was expected to greatly revitalize the country's aviation industry.

AFGHANISTAN. A landlocked Asian kingdom, bounded on the north by the USSR, in the extreme northeast by China, on the east and south by Pakistan, and on the west by Iran, Afghanistan has an area of 250,000 square miles and a population (est. mid-1958) of 13 million. About half of the people are Pushtuns (Pashtuns or Pakhtuns—the so-called true Afghans), Sunnite Moslems who speak Pushtu (Pashto); other sizable groups are the Tajiks, Hazaras, Turkomans, and Uzbeks. Persian is the most widely used language. The chief cities, with estimated populations, are Kabul (200,000), the capital, Kandahar (100,000), Herat (80,000), and Mazar-i-Sharif (50,000).

Government.—A constitutional monarchy, Afghanistan is ruled by Muhammad Zahir Shah, who ascended the throne in 1933. Executive power is shared by a Council of Ministers; the prime minister, Muhammad Da'ud, and the foreign minister, Muhammad Na'im, are brothers and first cousins of the ruler. Parliament consists of the House of Nobles or Senate, whose members are appointed by the shah for an indefinite period; and the National Assembly or National Council, whose 171 members are elected for 3-year terms. There are no political parties.

Education and Welfare.—Although most Afghans are illiterate, primary education is expanding rapidly. In 1957–58 there were 768 primary schools with 128,895 pupils, and 6,566 students were in secondary schools. Kabul University, established by law in 1946, had 1,067 students, and there were also teacher-training schools and vocational, technical, and agricultural colleges and institutes.

The government's public health programs place major emphasis on the prevention of disease. The United Nations and its specialized agencies are active in Afghanistan: in 1959 their aggregate expenditure in the country was $620,000.

Defense.—Afghanistan has an army of approximately 100,000 men and a gendarmerie of 21,000. The small air force is equipped with Soviet jet fighters and bombers.

Finance.—In the Afghan calendar year 1337 (March 21, 1958—March 20, 1959), revenue was estimated at 2,455 million afghanis; expenditure, also at 2,455 million (at the basic rate of exchange, 20.25 afghanis = U.S.$1; at the free rate, about 57 afghanis = U.S.$1). Gold and foreign exchange holdings totaled $83.2 million in 1957.

Transportation and Communications.—Afghanistan has no railways, and none of its 3,170 miles of all-weather roads are paved. Aryana Airlines, which is operated under a managerial contract by Pan American World Airways, serves the chief cities, and four international airlines serve either Kabul or Kandahar. As of 1958, there were 6,500 telephones and approximately 10,000 radio sets.

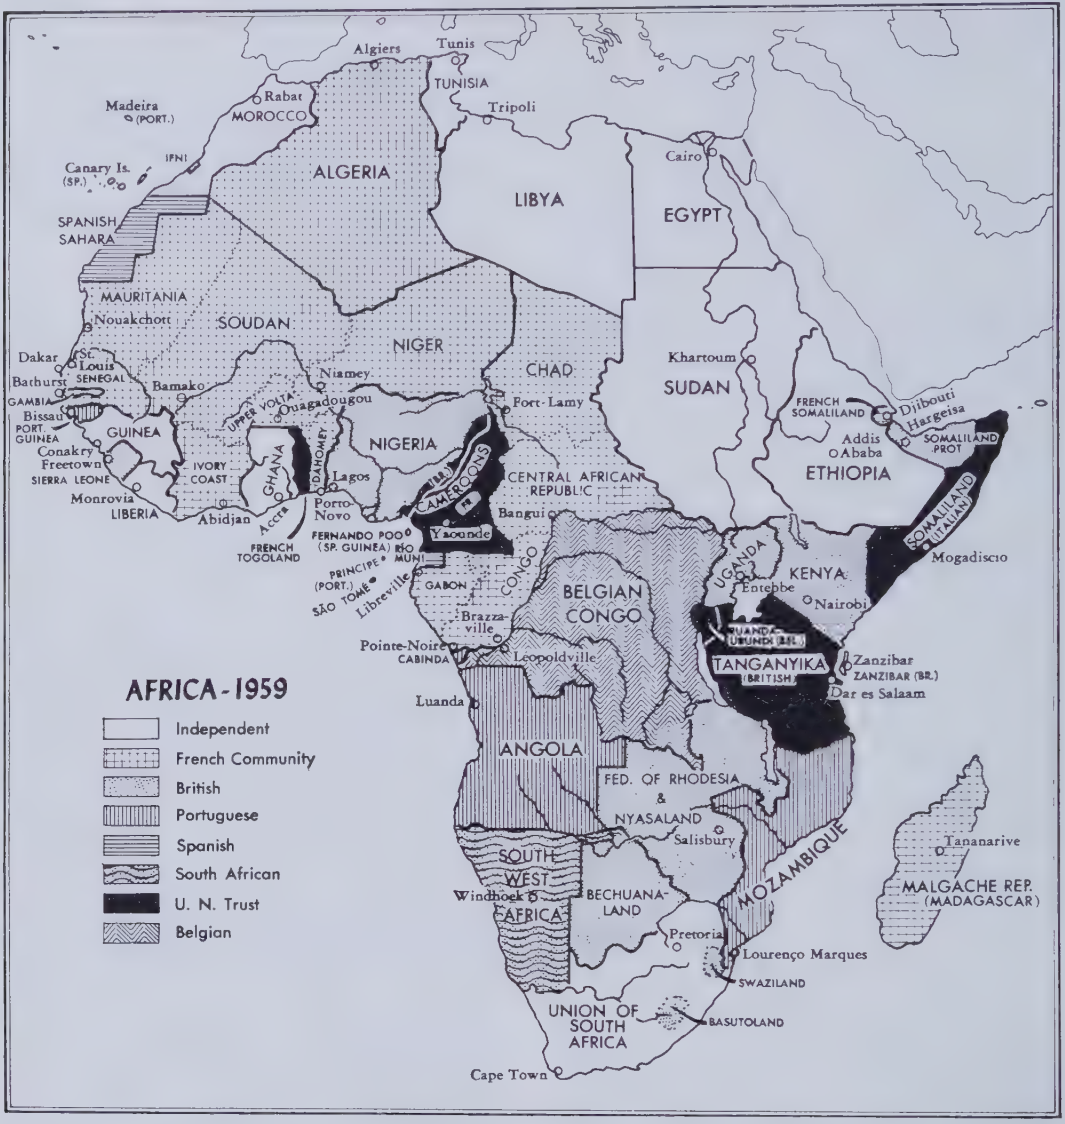
Economic Conditions.—Agriculture is the principal economic activity of Afghanistan. There are 20 million acres under cultivation, of which over half require some form of irrigation. Production of leading crops (in thousands of metric tons) was as follows in 1956–57: wheat, 2,100; corn, 654; rice, 274; fruits, 682; and barley, 280 (in 1955–56). In 1958, 65,000 bales of cotton were produced; in 1958–59, 39,000 short tons of sugar beets. Stock raising is carried on in all parts of the country, with sheep furnishing the chief source of income for much of the population. Foreign exchange is derived primarily from the export of wool (15,605,000 pounds, greasy, in 1956–57) and karakul skins (1,258,249 in 1957–58). Industrial development is limited largely to textile and sugar mills and to the output of 155 million kw.-hr. of electricity annually.

In 1957–58 exports totaled 1,984 million afghanis; imports, 1,966 million. Of the exports, 29% went to India, 22% to the USSR, 17% to the United States, 12% to Great Britain, and 5% to West Germany; of the imports, 30% was received from the USSR, 20% from Pakistan, 18% from Japan, and 10% from India. As of March 1959, Afghanistan owed $145.8 million to the USSR, $51.7 million to the United States, $12.3 million to Czechoslovakia, and $3.4 million to West Germany.

Principal Events, 1959.—A visit by Foreign Minister Muhammad Na'im to Moscow ended on January 2 with a statement that the USSR had offered to continue and extend economic development assistance. On January 14, a new American ambassador, Henry A. Byroade, was appointed to Kabul shortly after the United States announced a gift of up to 50,000 tons of wheat to relieve local shortages.

Prime Minister Muhammad Da'ud denounced the bilateral defense agreements which the United States signed with Iran, Turkey, and Pakistan on March 5, stating that his government would be compelled to examine the situation which they had created. Meanwhile, Afghanistan remained aloof from Iran and Pakistan and strengthened its ties with its other immediate neighbor, the USSR. In April a protocol covering the exchange of Afghan raw materials for Soviet manufactured goods was renewed in Moscow. Prime Minister Da'ud began a state visit to Moscow on May 18, and on May 28 the two countries signed a new agreement for economic and technical cooperation. Under its terms the USSR was to reconstruct the 470-mile road from Kushka, in the Turkmen SSR, southeast to Kandahar. This permitted Soviet activity south of the Hindu Kush, in a region closer to Pakistan and India. The USSR was also building a new road from Kyzyl-Kala on the Amu Darya to Kabul.

On September 14, Prime Minister Jawaharlal Nehru began a four-day official visit to Kabul. At the close of his meetings with Muhammad Da'ud, a joint statement was issued which stressed the decision of India and Afghanistan to continue to maintain their neutral position despite recent Chinese attacks. Later in the month, Muhammad Na'im went to the United States for medical treat-



AMERICANA MAP BY DONALD T. PITCHER

ment, and on October 12–14 he met with President Dwight D. Eisenhower and officials of the State Department. In these conversations he left the impression that Afghanistan would welcome a substantial American grant to offset the earlier Soviet grant, valued at $80 million, for road reconstruction. When asked to compare United States and Soviet aid to his country, he said that Afghan friendship did not depend on the volume of assistance.

President Eisenhower received a warm welcome from a crowd estimated at 300,000 when he stopped at Kabul for six hours on December 9. A communiqué issued after his discussions with King Muhammad Zahir Shah and Prime Minister Muhammad Da'ud stated that the president had given assurances for continued United States economic assistance to Afghanistan.

Author and Editor, "Afghanistan"; Author, "An Annotated Bibliography of Afghanistan."

AFRICA. Second only to Asia in size, the continent of Africa has an area of about 11,695,000 square miles and a population of 230 million (1958 est.). Throughout 1959 the tide of nationalism and anticolonialism continued to flow strongly in Africa, but despite some outbreaks of violence, the year was free of major disasters. In contrast with the great transformations that occurred in 1958, and those that are scheduled to occur in 1960, no major African territory altered its political allegiance in 1959, though many progressed toward independence.

Within the Federation of Nigeria, scheduled to attain independence from Britain on Oct. 1, 1960, the predominantly Moslem Northern Region followed the path already trodden by the Eastern and Western Regions, and in a quiet and orderly fashion became a self-governing territory on March 15, 1959. Nigeria's near neighbor, Ghana (the former Gold Coast), seemed to be moving further and further from the British patterns of government bequeathed it by its former rulers, as Prime Minister Kwame Nkrumah tried to obliterate the opposition party by electoral intimidation and by legislation giving his government extraordinary powers. His dislike of criticism was shown also in

the expulsion in June of the correspondent of the respected *Sunday Times* of London.

In the Belgian Congo, hitherto one of the quietest areas of the continent, combining a considerable degree of economic progress with an almost complete lack of political development, the year marked a change. Cautious plans for a gradual introduction of local self-government were announced, the first stage being elections to territorial and urban councils in December. Word of the impending political change appeared to stimulate outbreaks of violence; hitherto quiescent intertribal rivalries were revived, and there were riots in both central and lower Belgian Congo in September and October.

Restiveness within the former French colonies in Africa indicated that the solution achieved in September 1958 would not prove permanent. At that time 11 of France's 12 African colonies (Guinea voted for complete independence) elected to retain association with France within the framework of the French Community, which reserved for France important powers in the areas of defense, foreign policy, and higher education, while granting full local self-government to member republics. Precisely a year later, in September 1959, the Mali Federation, composed of the two West African states of Senegal and Soudan, decided at a meeting in Dakar to move onward to independence. The statements announcing the decision were moderate in tone and friendly toward France. The change was to be brought about by negotiation with France, and was expected to be achieved sometime in 1960. The Mali decision stimulated the restlessness of some other members of the French Community, particularly Dahomey and Niger, which also seemed ready to move toward independence. In the Ivory Coast, however, the strong prime minister, Félix Houphouët-Boigny, seemed content with the existing arrangements. (See also FRENCH COMMUNITY.)

The new states of Africa are subject simultaneously to unifying and to divisive influences. Their common efforts against colonial rule, together with the fact that many of them are very small, tend to bring them together in federations, such as Mali, or other unions. Once self-government has been achieved, however, independence—even independence from other African states—begins to be cherished; and not all of the new rulers are willing to surrender their newly acquired power or to merge it with that of others.

While several plans for union of Central and West African countries have been proposed, the extent to which they will be realized remains doubtful. The joint announcement on Nov. 23, 1958, by Prime Minister Nkrumah of Ghana and Chief of State Sékou Touré of Guinea of a proposal to merge their states was the most spectacular example of the trend toward union, since Ghana is a member of the Commonwealth of Nations and Guinea had recently been a member of the French Union. The year that followed saw no firm move to implement this project; nevertheless, the two leaders extended the scope of their program in an announcement from Conakry, Guinea, on May 2, proposing a Union of Independent African States, "open to all African states which have gained or are in the process of gaining their independence," and involving a common citizenship and currency. A rival project of a much looser kind, to which the name Associated States of Africa has been given, has been sponsored by President William Tubman of Liberia.

Despite practical difficulties, Africa is changing so rapidly that no political proposal which goes with the current tide can be dismissed as chimerical; advances toward a United States of Africa may well make considerable progress in the near future, particularly south of the Sahara and north of the Federation of Rhodesia and Nyasaland (Central African Federation). Even in the north, along the southern shore of the Mediterranean known as the Maghrib, there were many signs of a consciousness of common identity in Morocco, Algeria, and Tunisia.

On many occasions during the year, the newly independent African states reacted almost identically to events affecting various parts of the continent, interpreting developments uniformly in

Festive dancers in Soudan celebrate the formation of the Mali Federation, linking their country and neighboring Senegal. Flag in center is that of new federation. In December 1959, French President de Gaulle agreed to aid Mali in gaining sovereignty.

AFRICAN AMERICAN INSTITUTE INC

terms of the African nationalist struggle against white dominance. Thus, in their statements on Algeria, the African states regularly supported the rebels against the French; and, similarly, they pounced upon the Nyasaland Commission of Inquiry's report of July 24 (the Devlin Report), with its criticisms of British colonial policy. Most impressive of all in its unanimity was the African response to the French proposal to test atomic bombs in the Sahara. The Executive Council of the French Community approved the tests over the objections of the prime minister of the Mali Federation (September 11); but an all-party delegation from Nigeria, headed by the federal prime minister, went to London to protest, while Dr. Nkrumah in Ghana condemned France for choosing to "play with millions of lives," and called it an action which would "have the gravest consequences on her relations with the peoples of Africa."

European relations with the wholly African states of the center and west, however touchy, were simple as compared with the continuing complex problems of the plural societies in Algeria and in the east and south of the continent. The French government made a supreme effort to solve the Algerian question in President Charles de Gaulle's speech of September 16, offering (once peace was restored) a free choice to Algeria among secession, integration, and a measure of autonomy. It remained uncertain at the end of the year whether this offer would lead to negotiations with the National Liberation Front (FLN) and to a lasting peace. The influence of President Habib Bourguiba of Tunisia with the FLN rebels was thrown on the side of negotiation.

In the Federation of Rhodesia and Nyasaland the year was troubled. The threat of disorder in Nyasaland Protectorate, which has the federation's largest African majority, led to the imposition on March 3 of emergency regulations which continued in force throughout the year; to the banning of the Nyasaland African Congress; and to the imprisonment of its leader, Dr. Hastings Banda. These events postponed sine die the attainment of dominion status (which would free the federation's native policy from British supervision), hoped for by the ruling United Federal Party, and caused the British government to take a second look at the whole structure of the six-year-old federation. A commission, under the chairmanship of the distinguished lawyer, Lord Monckton, was appointed to advise on the review of the federation's constitution in 1960.

In the Union of South Africa, the basic question of native policy motivated the two most important developments of the year: the split in the opposition United Party, from which its more liberal members seceded; and a dispute regarding the degree of autonomy eventually to be given to the Bantu reserves. The provincial elections in October showed no change in party strengths—a disappointment to the ruling National Party, which had hoped for a strong endorsement of its native policy.

Among the plural societies of Africa, the most encouraging news was the Kenya government's announcement in October of a plan to open the White Highlands (hitherto a European preserve) to Kenya citizens of all races, the test for admission being competence in farming. In South Africa, and even more in East Africa, there is a notable ambiguity in the native African attitude toward the numerous Asian settlers. The industrious Asian shopkeeper or moneylender is a figure whose unpopularity is second only to that of the white man, and he may come to be the more unpopular. With the rise of African nationalism, many Asians are attempting to join the African independence movements in East Africa, but they are viewed suspiciously. These curious crosscurrents were clearly exhibited at the September meeting in Moshi, Kenya, of the Pan-African Freedom Movement of East and Central Africa.

In northeastern Africa, where the dark continent merges with the Middle East, the year generally went well. The cabinet reshuffle in the Sudan announced on March 9 seemed to succeed in its object of securing a more stable government; and, though union with Egypt seems to have been put on one side as a political objective, a Sudanese delegation visited Cairo in October for friendly discussions on trade and financial questions, and on the division of the Nile waters (on which agreement was reached on November 8).

The Sudan is gradually recovering from the disastrous sale of her enlarged cotton crop in 1956 and 1957. Her situation, however, points to one of the basic economic difficulties of most African territories. A higher standard of living can hardly be achieved by producing increased quantities of cash crops for sale in world markets, because the industrial countries have about as much of such products as they need, and the scope for increasing the market is small. A higher standard of living—or the same standard for more people—can come only by an enlargement of the towns and by some diversification of the economies. In the face of the natural reluctance of private investors to invest in the regions north of the Federation of Rhodesia and Nyasaland, such town-building and diversification will be difficult to achieve.

Although such long-term problems are real and cannot be shelved indefinitely, there were a number of hopeful signs in Africa in 1959, including a more moderate attitude here and there on the part of both African and white leaders. A surprising example of such moderation was the contemplated exchange of official visits between Ghana and the Union of South Africa, states at opposite ends of the African political spectrum. The invitation to visit Ghana, accepted in October by South Africa's External Affairs Minister Eric Louw, was evidence of an unlooked-for awakening to realities on both sides; its consequences can only be beneficial.

(See also separate articles on the African countries and the Index entry, *Africa;* and for a summary of President Eisenhower's visit to North Africa in December 1959, see EISENHOWER.)

ARTHUR C. TURNER,
Professor of Political Science and Chairman of the Division of Social Sciences, University of California, Riverside.

AGRICULTURAL RESEARCH SERVICE. This federal agency conducts or coordinates all of the research and carries out related regulatory responsibilities of the U.S. Department of Agriculture. Much of its work is cooperative with other agencies, institutions, and industries; some of it is done under contract. Following are highlights of recent activities, most of them accomplished during the department's fiscal year 1959.

Crops Research.—Scientists engaged in pioneering research discovered a pigment that controls all plant development. The pigment is blue, and appears in two forms—one that absorbs red light, and the other, far-red light. The discovery promises to be the key to man's complete control of plant growth from seed germination through plant flowering and fruiting.

One of the basic laws of heredity, which has been accepted for almost a century, does not always apply. Basic research with corn showed that a certain gene—the unit that controls heredity—is modified in its action by another gene. This differs

from the well-known Mendelian law that states that a gene never loses its identity, even though the characteristic it determines may be masked by a dominant partner gene. In other basic experiments with corn, cytoplasm (a constituent of plant cells) was found to alter genetic effects by affecting yield and ear height.

Planting seed corn kernels with points down and flat sides parallel to the rows conserves soil moisture and may reduce production costs by increasing the yield per acre, research showed. Scientists believe mechanical difficulties of "orientation planting" can be worked out.

Three plant-growth regulating compounds were found to exude from roots of treated plants into surrounding soil in quantities sufficient to be reabsorbed by nearby plants. This discovery gave hope of finding similar but pesticidal substances that would protect plants against diseases, insects, and nematodes.

A dagger nematode known to be a destructive plant parasite was found also to transmit fanleaf virus of grapevine from infected to healthy plants. This is the first evidence that nematodes may carry plant viruses.

Experiments at Beltsville, Md., showed that concentrations of ozone gas in slow-moving, polluted air may be the cause of injurious lesions (called "weather fleck") on growing tobacco leaves.

Soil and Water Conservation Research.—The "optimum-water-year," a new water-analysis system, devised and in use by Agricultural Research Service scientists, makes it possible for agriculture, industry, and municipalities to estimate more accurately than in the past the amount of water that flows from a watershed in a year's time.

Seeking the best methods of removing radioactive fallout from farm land, engineers and soil scientists found it possible to achieve 90 per cent or more decontamination by raking off straw mulch, removing sod, or scraping off surface soil.

Entomology Research.—High-flying insects, on Navy balloons, are being used to help solve the riddles of space flight. How insects react to cosmic and other radiation, as well as to the extremely low temperatures and pressures of outer space, is giving scientists a better understanding of the effects of these phenomena on human life.

Seeking better ways of controlling insect pests, entomologists have found a disease that kills citrus red mites, and certain chemicals and drugs that inhibit growth of ovaries in house flies, thus preventing egg production. Both discoveries are being explored for their practical use in pest control.

Many new and diversified uses for ethylene oxide as a potent sterilant have been found since Agricultural Research Service scientists, working in cooperation with the U.S. Army Chemical Corps, demonstrated that this highly flammable chemical could be used safely as an aerosol-dispensed product. Present and potential uses are to kill viruses or bacteria in hospitals, laboratories, hotels, holds of ships, rental shoe skates and swim suits, beehives, and in the manufacture of drugs. (See also BACTERIOLOGY.)

Crops Regulatory Programs.—The ceaseless campaign against plant pests and diseases ranged from round-the-clock interception of foreign pests at United States ports and borders to intensive, hard-fought battles against more than 20 specific pests and diseases of crops.

Increased public cooperation was sought by the Agricultural Research Service in keeping foreign pests out of the United States and in early detection of those that might have slipped into the country or spread to new areas. Travelers abroad were urged to not bring back prohibited plant and animal products in luggage. Farmers and gardeners were asked to watch for and report unexplained crop damage. Despite these regulatory efforts, some crop pests spread into new areas. These included the soybean cyst nematode; the rice disease, hoja blanca; the khapra beetle; and the Japanese beetle. Control or eradication measures against these pests are being continued.

Grasshopper populations in 1959 were at a generally low ebb in the western United States following extensive insecticidal spraying in 1958.

A large wooden dry dock in the ship channel at Houston, Texas, was fumigated to prevent spread of an extremely destructive species of termite not previously found in the United States.

Livestock Research.—Gains were made against three major livestock diseases by developing a killed-virus vaccine for Newcastle disease of poultry; finding the cause and a means of controlling rhinotracheitis in cattle; and discovering a virus that is one of the causative agents of shipping fever, a costly and prevalent respiratory disease of cattle.

"Monkey-faced" lambs, so called because of their deformed appearance, are not the result of any simple inherited character, research showed. Rather, this condition may be the result of some unknown substance eaten by ewes in early pregnancy.

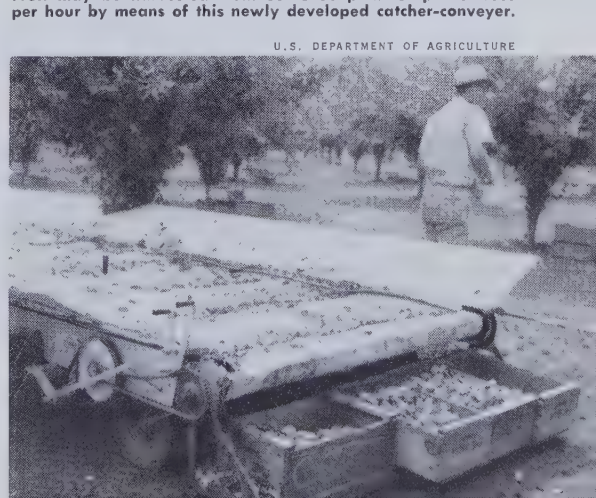
Agricultural Research Service scientists pioneered in use of high-frequency sound waves to measure fat and lean in live animals as an aid in selecting, finishing, and marketing superior meat animals.

Research on most efficient feeds for dairy animals showed that dairy heifers fed alfalfa hay gain more weight, gain faster, and consume more dry matter than heifers fed unsupplemented alfalfa silage or corn-alfalfa silage. Though most diets fed growing calves contain enough magnesium, basic research on how calves utilize this element nutritionally show that prolonged deficit of magnesium in the diet causes deposits of calcium in the large arteries, muscles, and hearts of growing dairy calves. Other research showed that the major advantage of feeding Aureomycin to dairy calves is the reduced incidence of scours (diarrhea), and not the temporary increase in growth rate.

The first turkey poults ever sired by a male turkey of known parthenogenetic origin hatched and grew normally at the Agricultural Research Center in Beltsville, Md. The young poults are unique because they have no paternal grandfather. Their sire developed parthenogenetically in a non-fertilized egg.

Fruit may be harvested from 30 to 50 plum or prune trees per hour by means of this newly developed catcher-conveyer.

U.S. DEPARTMENT OF AGRICULTURE



Livestock Regulatory Programs.—Animal quarantine inspectors made sure that more than a million animals entering the United States in the fiscal year 1959 were healthy. Almost 22,000 animals were refused entry. A shipment of 264 partridges from India was destroyed when found infected with a highly lethal type of Newcastle disease. Prompt and efficient action at the Animal Quarantine Station at Clifton, N.J., prevented spread of the disease to other quarantined poultry. To protect domestic livestock from foreign pests and diseases, inspectors seized and disposed of more than 26,000 pounds of prohibited or restricted meats arriving in the United States from other countries.

Plans for 772 new or remodeled slaughtering and meat-processing structures costing about $71 million met U.S. Department of Agriculture meat-inspection sanitary requirements. For the flood of meats and meat food products being offered the public, almost 38,000 labels and sketches were approved as giving the consumer a true word-and-picture story of the products carrying them. The production of meat from 100 million animals, mostly for American tables, was inspected for wholesomeness.

Three methods of handling and slaughtering livestock—chemical, mechanical, and electrical—were designated as humane by the U.S. Department of Agriculture in accordance with provisions of the Humane Slaughter Law of 1958.

In the all-out campaign to rid cattle of brucellosis, more than half of the counties in the United States, including all counties in 22 states, plus Puerto Rico and the Virgin Islands, had been certified by November. This meant that these areas each have less than 1 per cent of all their cattle and 5 per cent of all their herds infected with the costly livestock disease. Use of an inexpensive, convenient method for screening range cattle for brucellosis, based on blood-testing of dry and cull cows at slaughter time, was begun during the summer in Western cattle states.

Coordinated field studies of the screwworm, a serious livestock pest, were organized by Mexico and the United States. They sought to determine whether screwworms could be biologically controlled in Mexico and southwestern United States as they were in the eradication campaign in southeastern United States.

Utilization Research.—Many new ways to use farm products resulted from utilization research. Crystals of dry, whole milk that mix readily with water to produce a product comparable in flavor to fresh milk were produced experimentally. A newly discovered milk protein fraction called alpha z-casein offers a clue as to why evaporated and condensed milks often gel during storage.

Cheesemakers were given more assurance of a normal growth of the bacterial starter cultures they use in converting milk into cheese because of a new method of controlling culture-attacking viruses. Cheddar cheese was made experimentally with only about half the costly hand labor required with conventional methods.

Progress was made on a new, quick method of removing hair from animal hides. Scientists answered the question, "Why does leather shrink in water?" It melts, they found; heat and liquid break down molecular structure.

Woolen slacks, skirts, and socks treated with a modified epoxy resin—the best of many tested chemicals that impart minimum-care properties to wool fabrics—stood up well under severe practical testing. An improved method of scouring raw wool removed virtually all wool grease, as compared with conventional methods that remove only 60 per cent.

Research uncovered an improved wash-wear finish for cotton—an organic phosphorus compound called APO—that resists damage from chlorine bleaches, gives durable crease retention and wrinkle resistance, and increases flame resistance. A practical resin-forming chemical treatment for producing cotton fabric with outstanding rot resistance and improved weather resistance promises to open up new markets for cotton in awnings, tents, tarpaulins, and other outdoor fabric items.

Research also advanced cotton manufacturing methods. A cotton opener-cleaner developed by ARS utilization scientists has demonstrated savings of up to $100 a day per machine and is gaining wide commercial acceptance. A device that cuts cotton carding waste by more than half promises to save the textile industry millions of dollars a year. An accurate new device, developed for determining how much cotton yarn contracts (crimps) when woven into cloth, is proving useful to both scientists and manufacturers.

High-amylose starch—a new starch from a new corn—is a research-developed raw material for the corn-refining industry. Amylose starch forms tough, durable films with many potential industrial packaging, wrapping, and coating uses. An improved process for making another starch—dialdehyde starch—from cereal crops appears commercially usable.

Agricultural Engineering Research.—An "artificial chick," a temperature control device that simulates the heat-sensing ability of a baby chick, was developed and used by federal-state scientists to provide nearly ideal conditions for chicks under infrared brooder lamps. It consists of a 4-inch black globe that loses heat by radiation, conduction, and convection in much the same way that chicks lose body heat. As the chicks get older, more internal heat is supplied to the globe by adjustment.

Machines were developed to cut manual labor and increase efficiency in crop production. An automatic pilot for farm tractors, with lightweight "feelers" that sense the position of the crop row in relation to the tractor's front tires, was designed to make possible precision cultivation of row crops. Harvesting of prunes, plums, and some other small tree fruits from 30 to 50 trees in an hour was made possible with the development of a self-propelled catcher-conveyor. A versatile row-crop sprayer-duster, designed for controlling aphids on potato plants, holds promise for use on several other low-growing row crops. An experimental seed-potato cutter slices tubers of assorted sizes into 6 pieces of uniform size and shape at the rate of 15,000 pieces an hour.

A newly engineered electrical dairy system each day removes enough heat from cooling 200 gallons of milk fresh from the cows to help heat the milkroom or preheat 50 gallons of milkroom washwater.

Farm Economics Research.—Sales of farmland financed by land contract, a device which bypasses credit institutions as a party to the sale, approximately doubled between 1946 and 1958. By early 1958, sellers were financing 43 per cent of all farmland sales. Land contract has attractions for both buyer and seller in a period of rising prices.

Zoning, a legal device by which conflicting land uses and activities are separated, was being used increasingly to protect agriculture, with many counties putting fertile areas in farm zoning districts.

Changes in the traditional 50–50 livestock-share leasing arrangements can expand economic opportunities for both landlords and tenants, studies showed. Agreements in which tenants furnish a smaller, and landlords a larger, amount of the re-

sources for operating a farm enterprise seemed to offer some help in overcoming current money shortages of individual farmers.

Home Economics Research.—New leads toward determining the factors that affect the manner in which the body uses fat were developed in laboratory studies which used rats as test animals. The research showed that the amount of fat in the diet had less effect on the proportion of caloric intake stored as fat by rats than did the type of carbohydrate in the diet. Use of cornstarch instead of sugar in the rats' diet resulted in less weight gain, less enlargement and damage to kidneys and liver, and lowered cholesterol deposits in the liver. These highly preliminary research results remain to be validated for application to human nutrition.

U.S. Department of Agriculture national food supply figures, dating back to 1909, showed dietary trends over the 50-year period toward more milk, meat, poultry, eggs, fats, and sugars. People in 1959 also were eating more green and yellow vegetables, citrus, and tomatoes, but less of many other kinds of vegetables and fruits, especially potatoes. Use of grain products had steadily dropped.

Research showed that the optimum level for linoleic acid, an essential fatty acid, in infant diets seems to be about 4 per cent of the calories—the level found in human milk. Human milk contains more linoleic acid than does cow's milk.

E. G. Moore,
Director, Information Division.

U.S. DEPARTMENT OF AGRICULTURE

Sensitive "feelers" mounted on front of tractor permit precision cultivation of row crops and better weed control.

AGRICULTURE. United States farm output set another record in 1959. After the tremendous increase of 8% in total output achieved in 1958, it seemed hardly likely that 1959 would equal, much less surpass, this level of production. As 1959 neared its end, however, it was estimated that total farm output was about 1% above 1958, 25% more than the 1947–49 average and two thirds higher than in 1935–39.

Crop production in 1959 was at least equal to the 1958 record and was about 18% more than in 1947–49. Livestock production, a good 2% higher than in 1958, was at an all-time high.

Crop yields per acre were the second largest in United States history, exceeded only in 1958. Larger acreage compensated for the smaller yields.

Farm prices averaged about 4% lower than in 1958. In November 1959, prices received by farmers for their products were 8% lower than in the same month a year earlier. The cost of goods farmers buy, on the other hand, was about 2% higher both for the comparative months and for the year as a whole.

Food consumption per person in the United States during 1959 was estimated to be 13% above the 1935–39 average and 2% above 1958. Supplies of most foods were expected to remain very large in 1960. The retail price of food declined about 2% in 1959, due entirely to lower farm prices. A further slight decline was expected in 1960.

Farm Production.—A corn crop of more than 4.4 billion bushels, by far the largest in United States history, highlighted the 1959 crop picture. Corn production was one sixth higher than in 1958, previously the record year. The sugar beet crop also set a record. Production of soybeans and grain sorghums was second highest in the history of the two crops.

The wheat crop was down sharply from the mammoth production of 1958 but was still above the 1948–57 average. Yields of cotton, sugarcane, sugar beets, and dry peas were all-time highs, and those of barley, rice, hay, dry beans, potatoes, apples, peaches, pears, grapes, apricots, and cranberries were above the 10-year average. Output of tobacco, peanuts, flaxseed, rye, sweet potatoes, cherries, and pecans was relatively small.

Acreage.—Cotton acreage was about 26% larger than in 1958 and corn acreage was about 15% greater. Acreage of wheat was about the same as in 1958, but acreages of oats, soybeans, and sorghums were down. Major crops were planted on about 340 million acres in 1959, compared with 330 million a year earlier. Harvested acres were about 325 million and 321 million in 1959 and 1958, respectively.

Food and Feed Grains.—Production of feed grains reached 167 million tons, 10 million more than the previous high of 1958. The huge corn crop was primarily responsible. Sorghum and barley production was also large, but the oats crop was below average. The record production added to large carryovers resulted in the biggest supplies of grain, for the 1959–60 marketing year, ever accumulated in United States history.

Wheat production in 1959 was estimated at 1,117 million bushels, compared with the remarkable 1958 crop of 1,462 million bushels. For the 10-year period 1948–57, wheat production had averaged 1,075 million bushels.

Wheat supplies for the 1959–60 marketing year were estimated at a record 2,404 million bushels. These supplies included the 1959 crop, expected imports of 8 million bushels of feeding-quality wheat, and carryover stocks of 1,279 million bushels. The sharp increase in carryover stocks, due to the amazing 1958 crop, more than offset the drop in production in 1959 and carried total supplies to a new high.

Domestic wheat requirements in 1959–60 were expected to approximate 629 million bushels and exports, to total about 410 million. The result would be a carryover, on July 1, 1960, of some 1,365 million bushels, another new high.

Because of the heavy supplies, acreage allotments and marketing quotas were proclaimed by Secretary of Agriculture Ezra Taft Benson and approved by wheat producers in a July 1959 referendum. The wheat allotment for 1960 was set at 55 million acres, the same as in 1958, and the lowest acreage allotment permitted by law. With average yields, this acreage could produce a crop of 1.2

billion bushels, which would result in a further increase in carryover in July 1961.

The national administration tried repeatedly during 1959 to secure new wheat legislation providing for lower price support and elimination of acreage restrictions. Congress, however, favored higher price support tied to a 25% reduction in acreage. A bill containing these provisions was vetoed by President Eisenhower. The result was that no wheat price support legislation was enacted.

The 1960 wheat crop will be supported at not less than $1.77 per bushel, which is 75% of the parity price. This compares with support at $1.81 on 1959 wheat.

Corn production for 1959 was estimated in November at 4,402 million bushels, 16% more than the 3,800 million of 1958 and 35% above the 1948–57 average of 3,251 million bushels. The yield of 52.2 bushels per harvested acre was one fourth above the 10-year average. The 1959 crop matured in good time, but rains and damp weather made harvesting relatively slow. The price support level for 1959 corn was $1.12 per bushel. This support level was part of a new program for corn enacted in 1958 and chosen by corn producers in a referendum of the same year in preference to the former program.

The new program eliminates acreage allotments and offers price support to all producers regardless of how much they produce. The support level is based on 90% of the average price that prevailed in the three preceding years. Thus the support of $1.12 per bushel on 1959 corn was 90% of the average price received for corn in the calendar years 1956–58.

Corn supply for 1959–60 was estimated at 5,959 million bushels, 13% larger than a year earlier and 37% above the 1953–57 average.

Cotton.—A cotton crop of 14.8 million bales was forecast on the basis of information as of Nov. 1, 1959. This total was 3.3 million bales more than the small 1958 crop of 11.5 million and a little larger than the 1948–57 average of 14 million bales. Cotton supplies for the marketing year ending July 1, 1960, were estimated at 23.7 million bales, an increase of 3.4 million over the preceding year but less than in the mid-1950's. Requirements for the marketing year were expected to approximate 14.5 million bales: 9 million for domestic use and 5.5 million for export. The acreage allotment for 1960 cotton was about 16.3 million acres.

A new program was also in effect for cotton in 1959. Producers who chose to do so could exceed their acreage allotments by up to 40% and accept price support 15% of parity lower than that provided to producers who stayed within their allotments. This program was also to be in effect in 1960.

Cotton acreage in 1959 was considerably larger than a year earlier, due both to the new program and to elimination of the acreage reserve program under which about 5 million cotton acres had been retired from production in 1958. (See also COTTON.)

Other Crops.—The soybean crop of 528 million bushels was the second biggest on record. It was 8% below 1958 but 62% above average. The rice crop of 53 million 100-pound bags was 13% above 1958 and 11% above average. Sorghum grains reached a new record of 589 million bushels, down 4% from 1958 but 2¾ times the 1948–57 average. (See also GRAINS.)

Supplies of commercial fresh vegetables were somewhat below 1958, with yields of fall vegetables for the fresh market 12% less than a year earlier. Potato production of 242 million bushels was 9% below 1958 but 9% above average. Production of deciduous fruits was about 3% larger than in 1958 and 8% above average. (See also FRUITS; VEGETABLES.)

Tobacco production was estimated at 1,800 million pounds, compared with 1,736 million in 1958 and the 10-year average of 2,090 million pounds. (See also TOBACCO.)

Livestock.—Production of livestock and livestock products reached a new high in 1959, about 2.5% above 1958. Aggregate production of beef, veal, lamb, mutton, and pork was about 27.2 billion pounds. This total was 6% larger than in 1958 and was exceeded only by the 1956 output.

More than 5 million head of cattle and calves were added to the nation's stock during 1959, and the number on farms as of January 1, 1960, was estimated to be about 102 million, exceeding 100 million for the first time.

Hog production in 1959 was estimated at 103.6 million head, about 10% more than in 1958.

The 1959 lamb crop, about 21.1 million head, was 2% larger than in 1958. Sheep and lamb numbers have remained relatively stable during the past decade. They were estimated to total about 32.6 million at the beginning of 1959.

The poultry industry continued to set new records. Broiler production increased for the 13th consecutive year. Output of about 1.7 billion birds in 1959 was more than triple the production of 10 years earlier. About 80% of all chicken meat consumed in the United States in 1959 was from broilers. Egg production was about 4% above 1958 and at a new high. The average price of eggs on farms was 31.6 cents per dozen, the lowest since 1942.

Milk production for 1959 was about 124.7 billion pounds, compared with 125.2 billion in 1958 and the record of 125.9 billion in 1957. Milk production per cow continued to rise, averaging 6,430 pounds for the year, about 100 pounds more than in 1958. Milk production and demand were in closer balance in 1959 than in any year since 1952. (See also DAIRY PRODUCTS.)

Agricultural Income and Prices.—Farm net income, after rising sharply in 1958, fell abruptly in 1959. Gross income (cash receipts, the value of home-consumed farm products, rental value of farm dwellings, and government payments) totaled about $37 billion, compared with $38.3 billion the year before. Farm production expenses amounted to $25.8 billion, as against $25.2 billion in 1958.

Thus, total net income derived by farm operators from farming was about $11.2 billion, nearly $2 billion less than in 1958 and only slightly higher than the $11 billion of 1957. It should be noted, however, that the income of farm people from off-the-farm sources was somewhat higher in 1959 than a year earlier.

Farm prices, after rising somewhat in 1957 and 1958, declined again in 1959. The index of prices received by farmers in November 1959 stood at 230% of the 1910–14 average. This level contrasted with 247% for the corresponding month of 1958 and the high of 313% in February 1951. Prices paid by farmers on Nov. 15, 1959, were about triple the 1910–14 average.

In terms of the parity ratio (parity being the price at which farm products would have the same buying power as in 1910–14), farm prices in November 1959 were down to 77%, compared with 85% a year earlier and the record high of 123% in October 1946.

Consumption of Food.—Domestic food utilization in 1959 was slightly larger than in 1958 and

57% more than in 1935–39. Per capita civilian consumption of food in 1959 was 2% larger than in 1958 and 13% above 1935–39. Americans consumed record per capita quantities of broiler and turkey meat and slightly more milk and ice cream than in 1958. Pork consumption per capita was about 67 pounds, 6 pounds more than in 1958.

Civilian consumption of beef, at 81 pounds per person, was about the same as in 1958. Per capita consumption of beef, veal, lamb, mutton, and pork totaled 158.5 pounds. Though this was 6.5 pounds more than in 1958, it was considerably short of the 1956 record of 167 pounds.

With heavy production in 1959, the large numbers of cattle and pigs on farms, and big feed supplies, prospects for 1960 indicated continued large consumption of meat, dairy products, fats, and other foods.

Farmers' Share of the Food Dollar.—Farmers received about 38 cents out of each dollar spent for food in the family "market basket" during 1959. This amount was 2 cents less than a year earlier, 7 cents less than in 1953, and 15 cents less than in 1946. The declining share of the consumers' food dollar going to farmers continued to be one of the foremost problems confronting American agriculture.

Agricultural Assets.—The physical assets of United States agriculture increased 2.5% in dollar value in 1959. Total assets as of Jan. 1, 1960, were estimated at $208.2 billion, compared with $203.1 billion a year earlier. Proprietors' equities were $184.2 billion, an increase of $4.4 billion for the year. Debts owed by farmers rose from $23.3 billion on Jan. 1, 1959, to $24 billion on Jan. 1, 1960.

Land Values.—A steep rise in farm real estate values, which added nearly a third to market values of land in a five-year period, showed signs of leveling off in 1959. Although the index of land values as of July 1, 1959, was an all-time high—6% above a year earlier and 69% above the 1947–49 average—the rise in 1959 itself was slight.

Agricultural Exports.—Farm exports were valued at $3.7 billion in 1958-59, compared with $4 billion in 1957–58 and an all-time high of $4.7 billion in 1956–57. Lower world prices for agricultural commodities plus a severe drop of 51% in cotton exports were responsible for the 1958–59 decline in value, although the actual volume of farm goods shipped abroad was the third highest in United States history. For the 1959–60 marketing year a substantial increase in exports was expected. About one third of all farm exports in 1958–59 were financed under various government programs.

There was in 1959 a growing economic offensive in agricultural trade on the part of the Soviet Union. To combat this offensive in part, the United States stepped up its participation in trade fairs throughout the world (see FAIRS AND EXHIBITIONS). In the past four years, United States farm products have been displayed at more than 40 such fairs in 16 countries.

In September–October 1959, Secretary Benson and members of his staff visited 7 European nations to study and stimulate agricultural trade. He reported that prospects for increased trade were good.

Price-Support Operations.—Prices of agricultural products averaged nearly 20% below parity in 1959, a drop of about 4.5% below the 1958 parity ratio level. Support extended on 1958 crops during the fiscal year 1959 totaled $4,004 million. This sum was nearly 50% more than in the preceding year, when $2,690 million was extended on 1957 crops. Net losses on the price-support program were $821 million, compared with $1,007 million in the fiscal year 1958.

Agricultural Employment.—An estimated average of about 7.4 million persons, including full-time and part-time farm operators and hired workers, and unpaid family labor, worked on United States farms in 1959. Farm output per manhour of work was 89% more than in 1947–49. Hourly wages for hired labor, excluding room and board, averaged about 95 cents an hour. Wage rates had risen more than 40% since 1947–49.

Other Highlights of 1959.—President Eisenhower, in a special agricultural message in January, called for a more vigorous use of "food for peace." Conferences were held during April and May among agricultural officials of the United States, Canada, Argentina, Australia, and France to explore ways of using surplus wheat to improve world diets and stimulate economic development.

The most significant agricultural legislation of the year was the extension until Dec. 31, 1961, of Public Law 480, the Agricultural Trade Development and Assistance Act, with authorized expenditures of $1.5 billion per year. P.L. 480 is the heart of United States surplus disposal efforts. During the 12 months ended June 30, 1959, $2.6 billion worth of surplus farm commodities were moved into consumption channels through this and other programs.

The Rural Electrification Administration (q.v.) celebrated the 10th anniversary of the rural telephone program in October 1959. About 900,000 rural subscribers in 1959 were being served by this program, most of them with improved dial telephones. When the telephone program began, only 38% of United States farms had telephone service. In 1959 more than 60% had service, and the proportion was rapidly growing.

The Farmers Home Administration (q.v.) made and insured loans totaling $362 million in the fiscal year 1959, compared with $330 million in 1958.

The Rural Development Program, which helps farmers and rural dwellers in low-income areas acquire and take advantage of opportunities to improve levels of living, had by 1959 extended its operations into 200 counties in 30 states and Puerto Rico. More than 300 local community projects were under way in 1959.

The conservation reserve was expanded in 1959 in an effort to offset in part the discontinuance of the acreage reserve which was eliminated after the harvesting of 1958 crops. In 1958 the two programs combined had been in effect on about 28 million acres, with the acreage reserve taking about 17 million acres out of production. In 1959 the conservation reserve alone took some 23 million acres out of production, and an expansion to 28 million was anticipated for 1960.

The national forests in the fiscal year 1959 produced 8.3 billion board feet of timber, a record yield. Over 2 billion seedling trees were planted. (See also FORESTRY.)

Under the program to wipe out brucellosis in cattle, seven more states became practically free of this costly disease, bringing the total to 22 states and 55% of the counties in the United States.

In November 1959 President Eisenhower and Secretary Benson called for a farm program built around an expanded conservation reserve and rural development program, a vigorous Food for Peace Program, expanded research to develop agricultural markets and new uses for farm products, and realistic price supports.

The World Food Situation.—The world food situ-

ation has been improving for several years. In the 1958–59 season, production exceeded the previous two years by about 4%. It surpassed 1955–56 production by 9% and the 1948–53 average by 27%.

Per capita food supplies in 1958–59 were 5% above 1955–56 and 13% above the 1948–53 average. World output of food leveled off somewhat in 1959, mostly because of sharply reduced wheat output in the United States and the Soviet Union. World sugar production also declined, while output of rice, livestock, feed grains, and vegetable oils increased.

In western Europe much of the region north of the Alps suffered from drought in 1959. The drought came too late to affect wheat and feed grain crops, but crops of sugar beets, potatoes, and forage were down and fall pastures were poor. On the other hand, oil crop prospects were much better than in 1958, with both Spain and Italy expecting very large olive harvests.

Although drought also hit eastern Europe, growing conditions were generally better. An excellent harvest was gathered in the Danube Basin. Livestock production increased in most parts of eastern Europe.

Crops in the Soviet Union in 1959 were believed to be about average and well below the high 1958 level. Drought lowered crop yields in important regions. Harvests of wheat, feed grains, sugar beets, potatoes, and sunflower seed were all down from 1958. Nevertheless, wheat supplies for 1960 were undoubtedly much in excess of domestic needs. A further increase in meat and milk production seemed likely for 1959.

Crop prospects in Communist China held little promise for improvement in the food situation. Weather conditions were only fair to poor, with floods, droughts, and typhoons hitting important areas.

Food production in most Far Eastern countries was larger than in 1958. All regions except Pakistan and Ceylon had larger grain output. India harvested a record wheat crop in 1959 and also had a good rice crop. Bumper crops of rice and corn were in prospect for the Philippines, and the rice and other grain crops in South Korea were at new postwar highs.

In western Asia as a whole, the food production outlook was about average. Iran had an excellent wheat crop, but Syria, Lebanon, Jordan, Turkey, and Iraq suffered from drought or other difficulties.

In Africa production of major food crops was up in the northeast and down in the northwest. In Morocco, Algeria, and Tunisia, grain output was lower than in 1958, while Egypt, the Sudan, and Ethiopia were expected to have some grains for export.

Production of staple foods increased in the northern part of Latin America, largely because of excellent corn, sugar, and bean crops in Mexico. In Brazil, excessive rains and flooding reduced production of beans, while the crop of wheat and other small grains was expected to be only slightly better than the poor 1958 output. In the southern regions of Latin America, total crop output in Uruguay, Argentina, and Chile seemed likely to be better than a year earlier.

Food production in Canada was larger in 1959, with wheat output up 13% above 1958 and with some increase observed in the output of livestock products.

Increases in meat, milk, and wheat production were expected in New Zealand, but Australian crops suffered from unusually dry weather which cut into wheat and small grains production. (See also FOOD AND AGRICULTURE ORGANIZATION OF THE U.N.; STANDARDS OF LIVING.)

C. J. ENZLER,
Information Specialist, Office of Information, U.S. Department of Agriculture.

AIR CONDITIONING AND REFRIGERATION. The total of industry shipments in the United States, after declining in 1957 and 1958, resumed its growth in 1959. This trend is reflected in accompanying Table 1.

Table 1—INDUSTRY SHIPMENTS INDEX, 1956–59
(1947–49 = 100)

Year	All products	Industrial products	Commercial products
1956	438	327	469
1957	392	306	416
1958	377	282	403
1959	410	300	440

Accompanying Table 2 indicates that room air conditioners represented 29% of the industry's shipments in 1958, and all packaged air conditioning products (tabulated items 6–9, inclusive), 49%. Both were below 1956 ratios. The general trend was nevertheless toward factory-assembled packaged products (to minimize field labor) and more compact designs. The favorable summer of 1959 resulted in retail sales of 1,700,000 room air conditioners and a reduction of inventories to about 250,000 by the end of September.

Shipments of commercial products in 1959, particularly heat pumps, increased substantially, and some shortages developed in packaged air conditioning products. Central residential air conditioning installations in recent years have been as follows: 1955, 125,000; 1956, 160,000; 1957, 150,000; 1958, 135,000; and 1959, 200,000. This expansion in the residential market reflects in part a greater concentration on promotion and reductions of installed costs.

The demand for industrial goods increased 5 to 10% in 1959, but unprecedented price competition reduced price levels and profits. Projects in the planning and bid stages indicated a good year in 1960. New products and refinements of industrial goods were expanding markets. The latter include smaller dimensions of equipment, higher speeds of refrigeration components, and appreciably quieter air cycle apparatus.

Automobile air conditioner sales in 1958 were about 530,000, and the forecast for 1959 was 700,000. Conversions of refrigerator railway cars to mechanical refrigeration continued steadily; the most recent single order in late 1959 was for over 1,000 cars.

Table 2—MANUFACTURERS' SHIPMENTS, 1958
(Excluding household refrigeration)

Major product group	Units	Value
Condensing units	530,419	$ 62,104,000
Compressors and compressor units	2,959,157	139,909,000
Centrifugal refrigeration systems	1,090	32,043,000
Heat exchangers, all types	...	79,409,000
Air conditioners, not self-contained	193,986	42,324,000
Room air conditioners	1,673,295	257,466,000
Air conditioners, self contained (except residential and room air conditioners)	93,978	74,585,000
Heat pumps	25,461	18,847,000
Residential air conditioners	111,102	80,787,000
Ice-making machines	31,118	17,913,000
Absorption and adsorption apparatus	2,191	12,743,000
Motor vehicle refrigeration systems	7,525	15,911,000
Packaged liquid chillers	4,549	15,769,000
Mechanical dehumidifiers, refrigerated	223,354	12,753,000
Mechanical drinking water coolers	139,276	20,390,000
Total	...	$828,953,000

(Source: U.S. Department of Commerce.)

Factors which in 1959 were expected to influence the future structure of the industry and its markets were varied. These included mergers and diversification of product lines, the increased air conditioning of schools and colleges, growing out of electric heating, gas-powered air conditioning systems, the utilization of electronic filters, the greater use of air for condensing, and thermoelectric refrigeration developments.

V. T. KARTORIE,
Manager, Market Research,
York Division of Borg-Warner Corporation.

AIR FORCE, U.S. Scientific advances in the past decade have had a strong impact on the Air Force. The transition from piston engines to all-jet aircraft involved widespread changes in the organization and structure of its combat force. The further conversion from the almost exclusive reliance on ordinary explosives for tactical use to a dual capability with both conventional and nuclear weapons of all sizes and yields has also left its mark. And the introduction and integration of missiles into the force added new considerations for budgetary and force-structure planners. Moreover, in 1959 the importance of space flight clearly emerged from the realm of future planning to the area of current operations.

On Dec. 11, 1959, James H. Douglas, secretary of the Air Force since May 1, 1957, and under secretary before that since March 3, 1953, was sworn in as deputy secretary of defense. Succeeding to the post of secretary of the Air Force on the same day was Dudley C. Sharp, who had been under secretary since Aug. 3, 1959, and assistant secretary (matériel) from Oct. 3, 1955, to Jan. 31, 1959.

Strength and Budget.—At the end of June 1959 the Air Force structure consisted of 105 wings, including 43 strategic, 35 tactical, and 27 air defense wings. Military personnel strength had decreased from 871,156 on July 1, 1958, to 840,435, including 131,602 officers and warrant officers, and 708,833 airmen. About 225,000 officers and airmen were stationed overseas. The number of civilians employed directly by the Air Force dropped from 315,806 to 313,466 during the fiscal year 1959.

The Air Force budget for the fiscal year 1959 amounted initially to $18.672 billion. This was nearly $2 billion above the amount originally provided by Congress for the fiscal year 1958. Two supplemental requests totaled nearly $109 million, but Congress actually appropriated a total of only $95 million. With $18.767 billion in new obligational authority, approximately $4.180 billion in unobligated funds, and anticipated reimbursements of $895 million, the Air Force had $23.842 billion available for obligation in fiscal 1959. Preliminary figures showed that actual obligations during the fiscal year totaled $20.766 billion and net expenditures, $19.090 billion.

The president's proposed Air Force budget for the fiscal year 1960 totaled $18.682 billion, including $915 million for military construction. It was estimated that expenditures would reach $18.675 billion.

Strategic Air Command.—At the present time, over 90% of this country's nuclear retaliatory effort is contained in the Air Force's Strategic Air Command (SAC) and in the Tactical Air Forces at home and abroad. Over the last ten years these forces have been procured, maintained, and trained for approximately 20% of the annual Department of Defense budget.

SAC's manned bomber force consists primarily of Boeing B-47 six-jet medium bombers and B-52 eight-jet heavy bombers. Although the total striking power of this force is almost beyond comprehension, by today's standards these planes are approaching obsolescence. Now replacing the B-47 is the B-58 Hustler, a supersonic delta-winged medium bomber powered by four turbojet engines. Its nonrefueled range exceeds that of the B-47 by 3,000 miles, and its speed is double that of the B-47. A possible replacement for the B-52 is the B-70 Valkyrie, now under development, which is powered by six high-energy turbojets and is fitted with a sophisticated, stellar-inertial bombing and navigation system. The Valkyrie will be capable of Mach 3 speed, altitudes above 70,000 feet, and a range of about 7,000 miles.

Meanwhile, the G model of the B-52 is in production. The B-52G has greater range than any of its predecessors, permitting it to make nonstop, round-trip, unrefueled flights against intercontinental targets from advanced bases in the Western Hemisphere. The B-52G is capable of carrying a full load of nuclear weapons in its bomb bay, and two GAM-77 Hound Dog air-to-surface missiles under its wings. The Hound Dog will give the B-52G the capability of standing off approximately 500 miles from an enemy target and launching its missiles at supersonic speeds to deliver nuclear warheads on important military objectives. The strategic forces also employ decoy missiles and other penetration aids, including electronic countermeasures. The air-to-surface Quail, released by B-47's and B-52's, reflects on radar screens like a bomber and thus confuses enemy defenses.

On Oct. 1, 1958, SAC completed its first year of operation under the "ground alert" concept, with a sizable percentage of its bomber and tanker aircraft loaded and ready for immediate takeoff to predetermined targets. The goal was to have one third of the strike force airborne within 15 minutes after warning of attack, and SAC was rapidly attaining this capability. Heavy bomb wings of 45 B-52's were divided into strategic squadrons of 15 bombers, plus 10 tankers for dispersal purposes. By June 30, 1959, eight of these strategic wings had been activated.

On Feb. 12, 1959, SAC became an all-jet bomber force. On that day the last of the command's B-36 reciprocal-engine bombers was flown into retirement. The event marked another milestone in strategic air operations, now geared entirely to the increased speed of jet aircraft.

SAC also has continued to increase its inventory of KC-135 jet Stratotankers. The KC-135 can fly at altitudes above 40,000 feet at speeds of more than 600 miles an hour during refueling operations.

On Jan. 1, 1959, under the Department of Defense Reorganization Act of 1958, SAC's position as a specified command of the Defense Department was reaffirmed. The line of control for command of operational activities proceeds directly from the president through the secretary of defense to the commander-in-chief of SAC, with the Joint Chiefs of Staff acting as executive agent for the defense secretary. This line of control greatly strengthens the relationship of the president, as head of the military, to the nation's primary strategic striking force. The commander-in-chief of SAC has authority to launch the alert in an emergency under "Positive Control" procedures. This concept provides that SAC bombers will fly to designated points well short of enemy territory, but must turn back at those points unless specific coded orders are received to proceed. Orders to go on to their targets and to expend their nuclear weapons must come from the president.

Tactical Air Command.—When the Korean War ended in 1953, it was apparent that the United States needed an efficient, economical means of

fighting limited wars. The Composite Air Strike Force (CASF) was developed to cope with any situation ranging from Communist-instigated internal unrest in a small uncommitted country to a full-scale local war as in Korea.

The backbone of today's fighter force is the F-100D Super Sabre, which is assisted by the F-101 Voodoo. In 1958, F-104's and F-105's entered the Air Force inventory. In the short-range missile field, the surface-to-surface Matador is being replaced by an improved version called Mace, and the Air Force has adapted to its aircraft a Navy-developed air-to-surface missile called Bullpup.

TAC's force in being includes 28 tactical fighter squadrons, 12 troop carrier squadrons, 4 tactical reconnaissance squadrons, 4 aerial refueling squadrons, and allied support and training units. Twelve bases in the United States are under TAC control, and other groups are located throughout the world.

North American Air Defense Command.—NORAD was established in 1957 to coordinate the air defenses of Canada and the United States. An integrated headquarters, commanded by a U.S. Air Force officer, was established in September 1957 at Colorado Springs, Colo., and in May 1958 the two governments announced their agreement to maintain NORAD for 10 years, or for a shorter period if both countries were agreeable.

NORAD has approximately 174,000 military personnel, including 115,000 from the U.S. Air Force, 35,000 from the U.S. Army, 10,000 from the U.S. Navy, and 14,000 from the Royal Canadian Air Force. Including National Guard, reserve, and other augmentation forces, the number is well over 200,000.

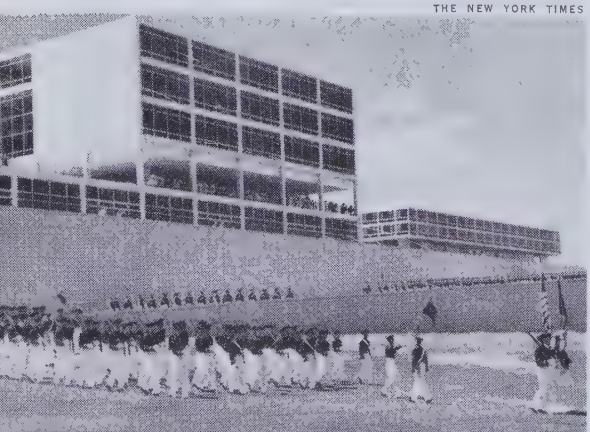
To augment the Distant Early Warning (DEW) Line, a radar network comprising more than 50 stations stretching some 3,000 miles from Alaska to the eastern coast of Canada, Congress provided funds to the Air Force in 1958 for construction of a new complex of isolated installations to provide a Ballistic Missile Early Warning System (BMEWS). At Clear, Alaska, and Thule, Greenland, two impressive radar installations are being installed—the first two units of the BMEWS—with giant radar reflectors eight stories high that can probe deep into Soviet territory to detect the launching of missiles. Complementing and providing control of the interception systems for air defense is the Semi-Automatic Ground Environment (SAGE) system, designed to track enemy intruders and guide aircraft and missiles on an interception course. Eventually, the SAGE network will encompass some 29 strategically located direction centers.

The manned interceptor force employs F-86L's, F-89J's, and the supersonic F-102's and F-104's, all of which are responsive to the SAGE control system. Air-to-air missiles available for use in air defense against manned jet bombers include the radar-controlled Falcon, the infrared Falcon, the Genie or MB-1 nuclear weapon, and the Sidewinder, all of which are in combat units.

With reliance for air defense being placed on ground-to-air missiles, particularly the Nike-Hercules and the Bomarc, no new interceptors were to be procured by the Air Force in 1960. The 200-mile-range surface-to-air Bomarc-A is designed to engage and destroy an oncoming enemy plane far from target. The first Bomarc training unit, the 4751st Air Defense Missile Wing, was activated in January 1958 at the Air Force Proving Ground Center, Eglin Air Force Base, Florida. Launching of the improved Bomarc IM-99B test missile, designed for a 400-mile range, took place on schedule in May 1959.

Dress parade is staged on grounds of Air Force Academy in Colorado. Academy graduated its first class in June 1959.

THE NEW YORK TIMES



Intercontinental Missiles.—As SAC's inventory of bombers and tankers grew to almost 3,000 aircraft in 1959, the command was taking its first steps into the missile era, aiming at a flexible, mixed force of manned aircraft and missiles. Since December 1958, when the first missile (a Thor) to be fired by an all-SAC crew went up from Vandenberg Air Force Base, California, command personnel have been supplementing their training with actual launchings and dry firings.

On Aug. 31, 1959, less than five years after the inception of the program, equipment for the first operational Atlas squadron was turned over to SAC at the Vandenberg base. From there, on September 9, the first operational Atlas was fired by a SAC crew, the flight achieving every set objective. Operational ICBM (intercontinental ballistic missile) capability was thus realized a full year earlier than originally planned.

A second ICBM, the Titan, was being developed. A two-stage liquid-propelled missile with range and speed roughly equivalent to the Atlas, the Titan will be launched from underground launching sites, affording maximum protection against enemy attack.

The Minuteman, the first solid-fuel ICBM, was still in the early development stages in 1959. This missile, considerably less expensive than the Atlas or the Titan, is expected to be operational in the early 1960's.

By the end of June 1959, 11 ICBM sites had been selected for SAC units, and construction was under way at several of these. Sites announced by late 1959 included the following Air Force bases: Offutt, Nebraska (SAC headquarters); Vandenberg, California; Francis E. Warren, Wyoming; Larson, Washington; Fairchild, Washington; Forbes, Kansas; and Lowry, Colorado. Early in 1959, SAC announced that operational missile units would be placed under the command's numbered air forces, a step designed to simplify command control and to expedite integration of the missile force.

Space Research.—On Sept. 23, 1959, the Department of Defense designated the Air Force as the nation's primary service in space. The new plan provided for the eventual assignment to the Air Force of responsibility for the development, production, and launching of military space boosters. The Air Force also would have the primary military interest in manned space travel.

In 1959 a number of space vehicles were successfully launched by the Air Force, acting under the auspices of either the National Aeronautics and Space Administration (NASA) or the Advanced Research Projects Agency (ARPA).

For Project Mercury, NASA's man-in-space effort, the Air Force is providing 10 Atlas boosters, as well as launch facilities and technical assistance. In addition, the Air Force conducted balloon tests for NASA and supplied training equipment for the astronauts who are preparing for flight into space. Thor boosters were also furnished for a deep space probe and lunar satellite project.

In December 1958, ARPA assigned the task of developing systems and techniques for operating space vehicles to the Air Research and Development Command's Ballistic Missile Division. Under Project Discoverer, initial tests of the propulsion and guidance systems of satellites were followed by attempts to recapture them. The recovery of satellites carrying live animals is an important step toward the success of the man-in-space program. The main stage of the Discoverer is a modified Thor, and the second stage, an Agena, a new vehicle with a special rocket engine. Initial versions of the Discoverer were designed to orbit for short periods at relatively low altitudes. Six out of eight Discoverer satellites achieved polar orbits in 1959.

On Aug. 7, 1959, the Air Force launched NASA's Explorer VI, known as the "Paddle Wheel" satellite. This was probably the most comprehensive space laboratory launched to that date by the United States. (See also SPACE FLIGHT.)

Installations.—At the end of June 1959 the Air Force was using 267 major bases. The following tabulation de-

NORTH AMERICAN AVIATION, INC.; USAF

(*Left*) The X-15, a rocket-propelled research craft, drops from its B-52 "mother" plane in first powered flight, September 17. (*Right*) An F-100 Super Sabre roars from a bombproof shelter in demonstration of Zero Length Launch at base in New Mexico.

picts the six main types, including foreign bases and contract flying schools in which the Air Force has no real property interest:

Classification	Total	U.S.	Overseas
Operational	162	84	78
Operational support:			
Flying	13	7	6
Nonflying	12	3	9
Training	42	42	0
Research and test	7	7	0
Logistical	18	16	2
Non-USAF (no real property interest):			
Foreign bases	8	0	8
Contract flying schools	5	5	0
Total	267	164	103

During the fiscal year 1959 the Air Force awarded construction contracts with a total value of $1,158.4 million, surpassing the contract total for the previous year by $230 million. The major construction programs conducted during the year included (1) Bomarc and ICBM facilities, (2) Ballistic Missile Early Warning System (BMEWS) sites, (3) SAGE facilities, (4) radar improvement, (5) DEW Line extension, and (6) airbase construction or expansion. The Air Force started no new major bases, most new construction involving expansion and improvements of existing facilities. New contracts, however, were let for auxiliary installations, chiefly gap fillers and aircraft control and warning facilities. New missile facilities were placed in the vicinity of established bases.

Air Force Academy.—In 1958 the Air Academy moved from its interim home at Lowry Air Force Base, Colorado, to its permanent site north of Colorado Springs, Colo., and was accredited by the North Central Association of Colleges and Secondary Schools. The curriculum was revised to include 183 credit hours, of which 135 hours are in academic subjects and 48 hours in military studies—or airmanship.

Beginning in June 1959, a new appointment system enacted by Congress in 1957 went into effect. Each member of Congress may nominate one principal candidate and 10 alternates in order of preference; or, if he prefers, he may authorize the Air Force to select the best qualified man from his 11 candidates. Other candidates are nominated in the same manner by governors of United States possessions, the District of Columbia, and the Commonwealth of Puerto Rico. Eighty-nine candidates are selected by the president of the United States from service-connected categories such as regular and reserve components of the Air Force and Army, sons of deceased veterans, and sons of members of the regular components of the armed forces. One vacancy will be filled by a vice-presidential nominee, and sons of Congressional Medal of Honor winners are admitted without regard to total vacancies, provided they pass minimum requirements.

On June 3, 1959, the academy graduated its first class (of 205 officers), and on June 26 it admitted 748 cadets—its first full-sized class. By the time three more classes of about this size have been admitted, the academy is expected to reach its authorized strength of 2,512.

Reserve Forces.—At the end of June 1959, Air Force Reserve (AFR) personnel totaled 552,768, of whom 225,819 were in the ready category. Air National Guard (ANG) personnel totaled 70,994, including 8,473 officers and 62,521 airmen.

ANG aircraft inventory at the end of June stood at 2,409, including 1,764 jet fighters, 195 jet reconnaissance planes, and 218 jet trainers. ANG aircraft were assigned to 24 tactical wings, 10 support flying squadrons, and 51 state headquarters. The 567 ANG units occupied 94 flying bases and 42 nonflying bases; 38 of the flying bases were being used jointly with other agencies.

The AFR rounded out its 15-wing troop carrier force in 1959 with the addition of its last three squadrons. At the end of the fiscal year 1959 the AFR possessed 37 flying facilities, all of which were shared with other agencies—19 with the regular Air Force, 10 with ANG, 3 with the Navy, and 5 with civil aviation.

ALABAMA. South Central state, United States; admitted to the Union, Dec. 14, 1819. The "Cotton State" ranks 29th in area and 19th in population among the 50 states.

Area and Population.—Area: 51,609 square miles (land, 51,078; inland water, 531), divided into 67 counties. Population: (1950) 3,061,743; (est., July 1, 1958) 3,164,000. Urban places with 1950 populations above 10,000 (unless otherwise indicated):

Alexander City	12,473[1]	Homewood	17,982[2]
Andalusia	10,032[3]	Huntsville	31,475[2]
Anniston	31,066	Mobile	173,849[2]
Auburn	12,939	Montgomery (*capital*)	106,525
Bessemer	28,445	Mountain Brook	10,937[1]
Birmingham	326,037	Opelika	12,295
Decatur	22,551[2]	Phenix City	26,961[4]
Dothan	28,820[2]	Prichard	27,589[3]
Enterprise	11,137[3]	Selma	27,575[2]
Fairfield	14,186[5]	Sheffield	13,324
Florence	27,465[1]	Talladega	17,670[2]
Gadsden	55,725	Tuscaloosa	46,396

[1] Special census, 1955. [2] Special census, 1956. [3] Special census, 1957. [4] Special census, 1958. [5] Special census, 1954.

Executive.—Chief state officers in 1959:
Governor: John Patterson (Democrat)
Lieutenant Governor: Albert Boutwell
Secretary of State: Mrs. Bettye Frink
Treasurer: Mrs. Agnes Baggett
Attorney General: MacDonald Gallion
Auditor: Mrs. Mary Texas Hurt Garner
Supt. of Education: Frank R. Stewart

Constitution and Judiciary.—The present constitution was adopted in 1901. The Supreme Court comprises seven justices; chief justice in 1959 was J. Ed Livingston.

Legislature.—The Alabama Legislature (Senate 35 members; House of Representatives, 106) meets in odd-numbered years. After an organizational session commencing the second Tuesday in January, the regular legislative session commences the first Tuesday in May.

The legislature was unusually active in 1959. A special session, called by Gov. John Patterson to meet between the organizational and regular sessions, authorized a $60 million bond issue for highway construction. After a $75 million general appropriation measure was adopted on June 17, the regular session was recessed for eight weeks to permit a special session on school finances. Measures were enacted at that session to produce an estimated $30 million of new revenue annually for education, by eliminating sales tax exemptions and increasing taxes on tobacco products. A record $304 million was appropriated for school operating expenses over the 1959–61 biennium. A bond issue of $100 million for new school construction was also authorized.

During the regular legislative session which resumed on August 25, taxes on liquor and beer were increased to produce an estimated $5 million of new revenue annually, half of which was allocated for expansion of hospital facilities for the mentally ill and half to increase old-age benefits. With the help of strong pressure from the governor, strict legislation was enacted to regulate the small-loan business.

Legislation to preserve racial segregation included an act authorizing the state to appropriate public funds directly to private schools when public schools have closed because of integration orders. Measures were also adopted which could make voter registration more difficult by permitting boards of registrars to spend less time registering voters. Other legislation empowered the attorney general to require persons suing the state to reveal who would pay the litigation expenses, recognized chiropractic as a legitimate phase of the healing arts, designated the camellia as the official state flower, and created special commissions to study the penal system and water resources. A resolution was also adopted petitioning the U.S. Congress to call a constitutional convention to strip the federal government of all control over public schools. Filibustering techniques underwent restriction in the Senate through changes of that body's rules.

Significant legislative proposals which failed of enactment concerned legislative reapportionment, efforts to bar the state from using ad valorem property taxes as a source of revenue, and authorization for the governor to close integration-threatened schools.

Finance.—In the 1957–58 fiscal year, state revenue of $397,372,819.10 comprised $228,079,440.59 from state tax sources, $99,291,784.17 from the federal government, and $70,001,594.34 from all other sources. Tax revenue consisted of $73,536,405.71 from a 3% general sales tax, $19,997,117.55 from individual income taxes, $7,824,464.97 from corporate income taxes, $65,633,957.96 from motor fuel taxes, $18,058,103.42 from licensing, and $43,029,390.98 from all other state tax sources. Expenditures of $365,831,218.55 comprised $122,160,420.66 for education, $97,379,165.11 for health, welfare, and safety, $77,470,396.88 for highways, and $68,821,235.90 for all other purposes. State long-term indebtedness on Sept. 30, 1958, amounted to $118,284,000.

Banking.—As of June 10, 1959, the state's 69 national banks had assets of $1,536,059,000, demand deposits of $1,020,019,000, and time deposits of $375,215,000. The 169 state banks, on June 23, 1959, had $593,788,759.35 in assets, $352,653,047.28 in demand deposits, and $182,286,239.56 in time deposits.

Education.—School attendance is compulsory between the ages of 7 and 15, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $114,998,229 ($171.76 per pupil), of which 24.1% was derived from local school districts, 71.1% from the state, and 4.8% from the federal government. Outlays for construction and improvements, including debt service, amounted to $23,508,690. Teachers' salaries averaged $3,372 (high school, $3,564; elementary, $3,225).

ALABAMA SCHOOL STATISTICS, 1958–59

Type of school	No.[1]	Teachers	Students
Public elementary (1–6)	2,222	14,469	474,777
Public junior high (7–9)	1,285	...[2]	175,278
Public senior high (10–12)	570	11,412[3]	125,926
Private and parochial elementary and secondary (1957–58)	147	1,280	18,150[4]
Public vocational (1957–58)	6	314	28,952
Colleges and universities	...	...	44,036

[1] There is some duplication among public elementary and secondary units; actual number, 2,401. [2] Included in senior high figure. [3] Includes junior high teachers. [4] Incomplete.

Social Welfare.—Public assistance expenditures from federal and state funds (excluding institutional costs) in the 1958–59 fiscal year totaled $68,098,555.18, including $54,237,053.19 for the aged, $7,559,095.03 for dependent children, and $5,029,182.63 for the permanently and totally disabled. A monthly average of 139,951 persons received public assistance. The state spent $7,718,674.92 for all mental health activities, including the operation of three hospitals for the mentally ill. Correctional and penal programs (1957–58) cost $4,198,478.41, including the operation of seven prisons (3,772 inmates on September 30) and 29 prison farms and camps (1,594).

Labor Force.—The labor force in June 1959 totaled 1,121,100 persons, of whom 155,000 were agricultural workers. Nonfarm employment reached 885,100, above the 868,800 figure for June 1958. Average employment of 870,000 for the 12 months ending June 1959 was, however, below that of 878,700 for the preceding 12-month period. Manufacturing absorbed 26.5% of nonfarm employment; government, 16.9%; and trade, 15.9%. The unemployment figure of 73,500 for June 1959 was down 25% from 100,000 a year earlier. The state paid $29,133,056 in unemployment compensation during the year ending June 30, 1959.

Manufacturing.—An estimated 4,400 manufacturing establishments in 1958 employed an average of 230,400 persons who received $906 million in salaries and wages. Value added by manufacture (1957) totaled $1,711,356,000, and expenditures for new plant and equipment amounted to $301,079,000. Production workers in manufacturing averaged $73.03 for an average workweek of 40.8 hours in August 1959.

MAJOR ALABAMA MANUFACTURERS, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.[1]
Primary metal industries	43,178	$232,234	$476,931
Textile mill products	42,984	119,785	190,433
Chemicals and products	8,110	36,673	132,032
Transportation equipment	17,494	83,367	126,148
Food and kindred products	18,182	56,880	112,935
Lumber and wood products	27,581	56,292	92,417
Fabricated metal products	9,875	44,595	89,014
Rubber products	5,387	31,053	84,035
Pulp, paper, and products	9,462	49,104	79,168
Apparel and related products	20,000	43,942	77,005

[1] For definition, see text footnote 1 in the article, *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—Alabama ranked first among the states in 1958 in the output of bituminous limestone. It stood second in the production of bauxite and slag; third in asphalt, china clay, iron ore, and scrap and flake mica; fourth in aluminum capacity and coke output; fifth in pig iron; and sixth in lime. It

ALABAMA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Cement (bbl.)[1]	13,588,000	$ 42,930,000
Clays[3]	1,548,000	1,787,000
Coal	11,182,000	72,360,000
Coke[2]	4,256,616	84,672,000[2]
Iron ore (long tons)	3,659,000	23,393,000
Iron, pig[2]	3,411,954	188,150,000[2]
Lime	520,000	4,660,000
Sand and gravel	4,128,000	4,210,000
Stone[4]	11,080,000	17,068,000
Other minerals	...	26,538,000
Total	...	$187,747,000[2,5]

[1] Excludes slag cement; value included in "Other minerals." [2] Values for processed materials are not included in the total. [3] Excludes certain clays, value included in "Other minerals." [4] Excludes certain stone; value included in "Other minerals." [5] Total adjusted to eliminate duplications in value of clay and limestone used in cement and lime. (Source: U.S. Bureau of Mines.)

was 21st in the total value of mineral output, with 1.14% of the national total. A salt dome discovered in the state in 1958 is the most easterly of all salt domes in the United States.

Agriculture.—Cash farm income for the first nine months of 1959 rose to $327,331,000, from $309,810,000 for the comparable period of 1958. For the full year 1958, income comprised $285,600,000 from livestock and livestock products, $191,779,000 from crops, and $43,435,000 from government payments. Principal livestock income sources were cattle, $96,882,000, and broilers, $74,140,000.

ALABAMA CROP INCOME

Crop	Cash receipts 1957	1958
Corn	$13,580,000	$19,034,000
Cotton lint	77,781,000	82,875,000
Cottonseed	8,507,000	6,572,000
Hay	941,000	1,266,000
Peaches	1,066,000	1,901,000
Peanuts	12,379,000	21,789,000
Pecans	1,032,000	6,512,000
Potatoes	4,320,000	5,240,000
Soybeans	5,241,000	3,658,000
Watermelons	2,736,000	1,870,000

(Source: U.S. Department of Agriculture.)

There were 192,000 farms in the state in 1958. Acreage (1954) totaled 20,810,000 (4,812,000 in harvested cropland). Livestock on farms (Jan. 1, 1959) included 1,816,000 cattle, 930,000 hogs, and 6,965,000 chickens (excluding commercial broilers). Family and hired workers engaged in farming numbered 288,000 during the week of Sept. 20–26, 1959.

Transportation and Communications.—An estimated $144,593,000 in state and federal funds were disbursed for roads and highways in the 1958–59 fiscal year. Approximately 1,350 miles of new highways were completed.

Highways and roads on Dec. 31, 1958, totaled 63,583 miles (23,746 paved and 26,010 soil-surfaced or graveled). Registered *motor vehicles* numbered 1,143,061 on June 30, 1959, including 907,417 passenger cars. There were (1958) 27 *railroads* operating 4,874.86 line miles; 5 regularly scheduled *airlines;* and 110 *airports and airfields* (64 commercial and municipal, 10 private, and 36 personal).

Communications media (1959) included 105 AM and 15 FM *radio stations,* 9 *television stations,* 18 daily *newspapers* (1958 circulation, 642,825) and 138 other newspapers, and (January 1) 200,200 business and 568,000 residential *telephones.*

Principal Events, 1959.—Gov. John Patterson was inaugurated on January 19, promising governmental economy, highway development, industrial expansion, maintenance of racial segregation, and promotion of public education. The governor won an early contest for control of the State Democratic Executive Committee by having the candidate of his choice elected as its chairman. The committee thereafter repealed the loyalty oath to relieve candidates and voters from any obligation to support nominees of the national Democratic Party.

Following the appointment of Law Professor Harry Haden as commissioner of revenue, the new administration mounted an ambitious campaign to equalize property tax assessments throughout the state. The campaign was subsequently abandoned when its unpopularity obstructed realization of legislative objectives sought by the administration.

The 1959 report of the federal Civil Rights Commission (see CIVIL LIBERTIES), issued on September 8, charged that Negroes in Alabama had been arbitrarily denied the right to vote. A suit by the United States in federal court to enjoin Macon County voting registrars from denying Negro voting rights failed after the registrars resigned from office. Some 1,800 Methodist laymen from Alabama and north Florida met in Birmingham on March 20 for the purpose of organizing to combat racial integration in the church.

Education had a good year in 1959, with public school teachers receiving average pay increases of 15% and with an estimated 1,500 new teachers hired in the state school systems. University of Alabama President Frank A. Rose announced the opening of a greater University of Alabama Development Program embracing plans to raise $5 million in private contributions. He subsequently announced an extended development program contemplating expenditures of $42 million over the next 10 years to expand the university's facilities.

Although Alabama's heavy concentration of iron and steel suffered from the national steel strike (see IRON AND STEEL), significant gains were reported during the year in nearly all other segments of the economy. Continued development of Alabama's inland waterways took place, with the highest lift lock in the world dedicated on November 10 at Wilson Dam (see CANALS). The city of Huntsville continued to be a boom town because of expanding activities at Redstone Arsenal, which in 1959 reached an employment level of 22,000 workers and an annual payroll of $125 million.

(See also NATIONAL PARKS AND MONUMENTS.)

Legislature and Principal Events by:
C. DALLAS SANDS,
Professor of Law, University of Alabama.

ALAND (or AALAND) ISLANDS. An archipelago of some 6,500 islands and reefs (50 inhabited) in the Baltic Sea, forming an autonomous department of Finland. Area, 581 square miles (of which Åland comprises 285); pop. (est. 1957), 21,800, mostly Swedish-speaking. Maarianhamina (Mariehamn, pop. 3,264) is the capital and chief city. Principal industries are fishing and shipping. Rye, barley, flax, and vegetables are grown.

ALASKA. Northernmost of the states of the United States, Alaska was admitted to the Union on Jan. 3, 1959. "The Great Land" ranks first in area and last in population among the 50 states.

Area and Population.—Area: 586,400 square miles (land, 571,065; inland water, 15,335). Population: (1950 census) 128,643; (July 1, 1958, est.) 191,000, of whom 156,000 are civilians. These include approximately 16,000 Eskimos, 15,000 Indians, and 4,000 Aleuts. The state's largest cities and their estimated 1958 populations are: Anchorage, 35,000; Fairbanks, 11,000; Ketchikan, 7,500; and Juneau, *the capital,* 7,200.

Executive.—Chief state officers in 1959:
Governor: William A. Egan (Democrat)
Secretary of State: Hugh J. Wade (acting governor from January 19 to April 20, because of governor's illness)
Commissioner of Revenue: Peter Gatz
Attorney General: John Rader
Commissioner of Administration: Floyd Guertin
Supt. of Public Instruction: Theo J. Norby

Constitution and Judiciary.—The present constitution was ratified on April 24, 1956. The three members of the newly established Supreme Court, appointed by the governor, were Chief Justice Buell A. Nesbett and Associate Justices Walter J. Hodge and John Diamond.

Legislature.—The Legislature of the State of Alaska comprises a 20-member Senate (in 1959, 18 Democrats and 2 Republicans) and a 40-member House of Representatives (34 Democrats and 6 Republicans). It convenes annually for a constitutionally unlimited session, starting on the fourth Monday in January.

Alaskans elected to the first legislature included one Aleut, one Indian, and seven Eskimos. Although half of the 60 members of the two houses were without earlier legislative experience, the legislature adjourned its 81-day session (January 26–April 16) with a balanced budget and no general increase in taxation. The budget called for spending of approximately $31 million, including $27.5 million from the General Fund and $3.5 million for highways.

Other legislative accomplishments included a State

Reorganization Act creating 12 departments of government and centralizing the executive authority in the governor; a land act setting up a state Division of Lands with authority to lay out procedures to be followed in the management of the 104 million acres of uplands granted by the federal government, the submerged lands, and the tidelands along Alaska's 33,904-mile tidal shoreline; and provisions for a party column ballot for primary elections and for the moving up of the primary date from April to August and of the general election date from October to November.

In other actions the legislature authorized the state to make contracts with labor unions; prohibited the employment of B-girls in bars; established a judiciary system with a three-member Supreme Court and an eight-member Superior Court; and passed a Workmen's Compensation Act with a more realistic schedule, and an Administrative Procedures Act prescribing methods for the establishment and review of agency regulations.

The legislature established the following annual salaries: governor, $25,000; secretary of state, $18,000; chief justice of the Supreme Court, $23,500; associate justices, $22,500; Superior Court judges, $19,000; and members of the legislature, $3,000.

Finance.—In the 1958–59 fiscal year, state revenue of $52,427,148.68 comprised $23,496,834.99 from state tax sources, $16,471,480.79 from the federal government, and $12,458,832.90 from all other sources. Tax revenue consisted of $8,134,603.31 from individual income taxes, $1,397,582,78 from corporate income taxes, $3,526,414.63 from motor fuel taxes, $4,564,473.24 from licensing, and $5,873,761.03 from all other sources. Expenditures of $47,042,721.92 included $16,173,451.90 for education and $2,779,753.75 for highways. State long-term indebtedness on June 30, 1959, amounted to $3,000,000.

Banking.—As of Dec. 31, 1958, the state's 7 national banks had assets of $151,606,444.18, demand deposits of $87,099,457.94, and time deposits of $54,349,746.54. The 11 state banks had $43,676,318.16 in assets, $25,665,724.77 in demand deposits, and $14,043,198.26 in time deposits.

Education.—School attendance is compulsory between the ages of 6 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $16,340,591 ($486.17 per pupil), of which 18% was derived from local school districts, 54% from the state, and 28% from the federal government. Outlays for construction and improvements amounted to $14,794,775. Teachers' salaries averaged $6,300 for the 1958–59 school year.

The state maintained 133 public elementary and secondary schools in 1957–58 for 27,421 pupils in grades 1 through 8, 1,330 in grades 8 and 9, and 5,246 in grades 9 through 12. There were 1,233 teachers for elementary grades, 54 for grades 8 and 9, and 304 for senior high classes. The state's 25 private and parochial schools had 1,743 pupils and 100 teachers

In addition, 5,114 Eskimos, Indians, and Aleuts were enrolled in two boarding schools (1,001 enrollees), 65 day schools, and 10 instructional-aid schools maintained by the U.S. Bureau of Indian Affairs, as well as in high schools of the state public school system.

Higher education is furnished by the University of Alaska on its campus at College, near Fairbanks; through its facilities at military bases; and by community college units at Anchorage, Juneau, Ketchikan, and Palmer.

Public Assistance.—In the 1958–59 fiscal year, public assistance expenditures of $2,699,398.18 comprised $1,081,990 for the aged, $1,344,603 for dependent children, $76,992 for the needy blind, and $195,813.18 for general relief, excluding medical care. Such assistance was given to an average of 6,168 persons monthly.

Transportation and Communications.—Much of the internal and external transport of passengers, mail, and freight is by air service. This fact accounts for the 19 regularly scheduled airlines which served the state in 1959 and for the availability of 610 commercial and municipal, 40 military, and 188 private airports and airfields. Most of the airlines provide facilities for trips to less frequented sections of the state, and bush pilots supplement this coverage. The annual number of flight passengers arriving at and embarking from the airports at Anchorage and Fairbanks alone exceeds the state's total population by 70,000.

An air development affecting Alaska in 1959 was the launching on June 5 of nonstop service by Northwest Orient Airlines from New York to Anchorage on its New York–Tokyo run. Alaska serves as a terminal area for several transpolar routes to various countries.

State and federal funds disbursed for roads and highways in the 1958–59 fiscal year included $16,532,000 for construction and $4,813,000 for maintenance. New construction amounted to 15.5 miles.

Highways and roads on July 1, 1959, totaled 4,235 miles (1,165 surfaced). Registered *motor vehicles* on the same date numbered 65,756, of which 47,642 were passenger cars. There were (1959) 2 *railroads* operating 509 track miles.

Communications media (1959) included 12 AM and 2 FM *radio stations;* 5 VHF *television stations;* and 6 daily *newspapers* (circulation, 47,647) and 7 others.

Economy.—On the basis of business license tax returns for 1957, the gross volume of business in Alaska was $586,486,000, not including operations of the mining and fisheries industries (see below, *Fisheries; Mining*), which are not subject to this levy.

Military construction is a significant factor in the economy, with contracts worth over $75 million placed by the U.S. Army and Air Force in the 1958 fiscal year. Tourism is the state's fastest-growing industry (see below, *Principal Events,* 1959), and the fur industry, including especially the fur seal catch from the Pribilof Islands (q.v.), is the state's most distinctive enterprise.

Labor Force.—Over 60,000 persons are employed, of whom approximately two thirds work for private industry and one third for the state, local, and federal governments. Approximately half of the total are engaged in nonagricultural employment covered by the state's unemployment insurance program. Percentage distribution of insured employment, as of March 15, 1959: wholesale and retail trade, 27%; transportation, communications, and utilities, 19%; construction, 16%; service industries, 16%; manufacturing, 12%; and other, 10%.

Insured unemployment in the nonagricultural category declined to 6,088 as of March 21, 1959, from 6,267 a year earlier. Unemployment compensation payments dropped to $6,492,335 in the year ending June 30, 1959, from $8,323,579 in the previous fiscal year.

Manufacturing.—Alaska's leading manufacture is fish processing. In 1958 there were 157 fishery and wholesaling establishments employing 7,370 persons who processed and marketed 215,301,904 pounds of products valued at $83,742,931. Other leading manufactures include sawmilling, printing and publishing, and the building and repairing of boats and ships.

Fisheries.—All fish and shellfish species landed in the 1958 calendar year were valued at $33,196,757 to fishermen, including $26,847,439 for 241,255,043 pounds of salmon, of which Alaska is the nation's chief producer. Other leading species included halibut ($3,348,500 for 23,359,000 pounds), herring, crabs, shrimp, and clams. There were 12,136 commercial fishermen as of Dec. 31, 1958.

Mining.—Mineral production was valued at $21,450,000 in 1958, down by about a fourth from the 1957 value because of a decrease in the military use of sand and gravel and a drop in the value and production of coal, gold, and mercury. The year was notable, however, for the production of oil in commercial quantities for the first time since 1933. The state continued to rank first in the primary production of platinum group metals and third in gold and mercury. Employment in the mineral industries totaled 1,925 persons in 1958.

ALASKA MINERAL PRODUCTION, 1958
(In short tons, except as indicated)

Mineral	Quantity	Value
Coal	759,000	$6,931,000
Gold (troy ounces)	186,435	6,525,000
Sand and gravel	4,255,000	3,871,000
Stone	615,000	2,065,000
Mercury (76-lb. flasks)	3,380	774,000
Silver (troy ounces)	24,000	22,000
Other minerals	...	1,262,000

Agriculture.—The total value of all farm land and buildings was $25 million in 1958, averaging $11,000 per farm. The state's approximately 2,300 farms, covering 265,000 acres (17,500 in harvested cropland) lie chiefly in the Matanuska Valley and the Anchorage area, and give employment to approximately 3,500 persons.

Cash income in 1958 comprised $2,403,000 from livestock and livestock products, $947,000

from crops (chiefly barley, oats, potatoes, and wheat), and $85,000 from government payments.

Forest Production.—The commercial timber cut is chiefly from Chugach and Tongass national forests. Approximately 200 million board feet, valued at $463,596, were harvested in the 1957–58 fiscal year, 20% under that of 1956–57.

Principal Events, 1959.—The year 1959 was appropriately welcomed in Alaska by the observance on January 3 of Admission Day, the day when Alaska officially became a state. In contrast with the hilarious celebrations on June 30, 1958, when Congress had given its approval of admission, ceremonies throughout Alaska were of a serious nature, taking cognizance of the responsibilities of statehood. On July 4, 1959, communities in Alaska combined the celebration of Independence Day with the observance of the first official raising of the 49-star national flag.

The Alaska Omnibus Act, passed by Congress in June, made the new state responsible for many of the services formerly performed by federal agencies. Besides a transitional grant of over $10 million, more than $25 million was made available for the construction of Alaska highways.

The Alaska legislature, in its first session after statehood, passed 200 bills and carried over 127 bills to the second session meeting in January 1960 (see also above, *Legislature*). In accordance with the State Reorganization Act, Gov. William A. Egan appointed heads of the 12 departments of government and other officials.

Under the statehood act, Alaska is to receive 70% of the net receipts from the sale of fur seals and sea otters on the Pribilof Islands (q.v.). Payments to the Eskimos for taking the animals constitute a major contribution to their economic well-being.

The year 1959 produced the poorest salmon pack (1,770,000 cases) since 1899. According to the federal Fish and Wildlife Service (q.v.), the reason for the low pack was the coincidence of poor cycles in all three major canning species—reds, pinks, and chums.

Fish traps were banned by action of the legislature on February 25. The three villages of Metlakatla, Kake, and Angoon refused to accept the ban and carried their appeal to the U.S. Supreme Court. Justice William Brennan, Jr., granted them the right to use traps during the summer, pending a review by the court.

Gas was being piped in 1959 into the native village of Barrow, the northernmost community in Alaska. A franchise was granted by Anchorage for the piping of gas from the Kenai Peninsula, where the state's only oil wells were producing 1,300 barrels a day by November. In the 1958 and 1959 fiscal years, Alaska's treasury was enriched by more than $11 million as a result of oil exploration activities. In September 1959 alone, the state's share of oil and gas leases amounted to $4,377,043.82. Approximately 32 million acres have been leased. Seven drilling operations were being carried on in 1959, and nine companies were reported planning geological and geophysical work on Alaska's Arctic slope.

Among other economic developments, the Sitka pulp mill began production in late 1959. This mill and another at Ketchikan, which began production five years earlier, will require 350 million board feet of logs annually. A carpenters' strike from June 27 to September 14 prevented much of the construction that had been planned for the summer period. A three-year pact, providing for pay increases, ended the halt.

Forest fires continued to plague interior Alaska, although not so seriously as in other recent years.

UPI

President Eisenhower signs proclamation making Alaska the 49th state. Witnesses to the ceremony on January 3 are (*seated*) Vice President Nixon and House Speaker Sam Rayburn; (*standing, left to right*) Ralph J. Rivers, congressman-elect; Ernest Gruening and E. L. Bartlett, senators-elect; Fred Seaton, secretary of the interior; Waino Hendrickson, acting governor; David W. Kendall, special counsel to the president; and Michael A. Stepovich, former governor.

In the 12 months ending June 1, 1959, 286 fires burned 439,000 acres of timber, compared with the 10-year average of approximately a million acres annually.

Much interest was being shown in 1959 in the possibility of using hydrogen bombs to blast a harbor at Cape Thompson on the sparsely settled northwestern shore of Alaska. A $35 million missile base was being erected at Clear.

The entertainment of tourists now ranks as the second major industry in Alaska. It is estimated that the number of tourists visiting the state in 1959 increased by 20% over that of the previous year. A number of hotels and resorts were being constructed to take care of anticipated future increases.

I. J. Montgomery,
Supervisor, Alaska Merit System.

ALBANIA. A country in the Balkan Peninsula, Albania is bounded by the Adriatic Sea on the west, Yugoslavia on the north and east, and Greece on the south. It has an area of 10,629 square miles and a population of 1,394,310 (1955 census). Tiranë (Tirana) is the capital and largest city (1955 pop., 108,183).

Government.—The Democratic Front, which was organized by the Communists during World War II, proclaimed a people's republic on Jan. 11, 1946. The Albanian Workers' Party, a Communist organization, controls the government. The People's Assembly, the 188-member legislative body through which the party operates, is elected every four years by universal suffrage. In turn, it elects the Presidium, which appoints and dismisses the Council of Ministers. Mehmet Shehu has been chairman of the council since July 20, 1954.

Education.—Elementary education is compulsory in the first stage, which lasts four years. In 1957 there were 3,200 seven-year primary schools with about 242,000 pupils. Secondary schools exist in the main cities, and have an enrollment of about 5,000. A state university was opened at Tiranë in September 1957.

Religion.—More than 70% of Albania's population are Moslems; the remainder is distributed between Roman Catholics (10% of the total) and Greek Orthodox (nearly 20%). The Catholics constitute a national church; the Greek Orthodox clergy are under the patriarchate of Moscow.

Finance.—The government budget for 1959 provided for revenues of 27.7 billion lek and expenditures of 26.9 billion. The corresponding figures for 1958 were 26.7 billion and 26.2 billion lek, respectively. The new budget includes expenditures of 16.6 billion lek for national economy, 5.7 billion for social and cultural activities, 2.1 billion for national defense, and 0.8 billion for administration (50 lek = U.S.$1).

Defense.—The USSR makes full military use of Albania, the harbor of Vlonë (Valona) and the island of Sazan (Saseno) constituting a veritable Soviet Gibraltar in the Adriatic. Kuçovë airfield has been equipped with Soviet

jet planes of the latest type. Reports reaching Greece in the summer of 1959 placed the number of Soviet specialists in the Vlonë area at more than 3,000.

Transportation and Communications.—Albania has 73 miles of railroads. Roads suitable for motor traffic aggregated about 1,370 miles in 1955. Soviet, Hungarian, and Czechoslovak airlines provide air service to Moscow, Lvov, Budapest, and Prague. There were 2,000 telephones in 1957. Broadcasting service is furnished by Radio Tiranë and five smaller stations; radio receivers totaled 20,000 in 1954.

Economy.—According to official statements, industrial production during the year 1958 was 20% higher than that of 1957. During the same period, foreign trade increased 27.1%. Capital investment, on the other hand, reached only 88% of the figure envisaged in the Second Five-Year Plan (1956–60). At the end of 1958 there were 1,935 collective farms, covering 76.2% of the cultivated land and employing 63.2% of the total number of peasant households. On Feb. 4, 1959, it was announced that 20 more collective farms had been merged into one, with an area of 2,958 hectares and employing 2,600 workers. It is estimated that because of improvement projects the land under cultivation had increased by 72% since 1938.

Following are production figures for 1958 (with percentages of increase or decrease, as compared with 1957, in parentheses): gasoline, 49,934 tons (31%); benzine, 31,229 tons (46%); crude oil, 403,197 tons (—18%); bitumen, 182,724 tons (24%); natural bitumen, 32,226 tons (—12%); coal, 255,677 tons (8%); chrome ore, 201,252 tons (20%), copper ore, 87,460 tons (56%); iron ore, 88,240 tons; electric power, 150 million kw.-hr. (20%); timber, 146,913 cubic meters (18%); bricks, 76 million units (12%); tiles, 18 million units (92%); cement, 77,552 tons (10%); cotton fabrics, 22 million meters (16%); woolen fabrics, 738,000 meters (64%); shoes and sandals, 740,000 pairs (14%); rubber sandals, 660,000 pairs (24%); olive oil, 2,813 tons (—12%); cheese, 2,819 tons (138%); butter, 407 tons (62%); and sugar, 10,275 tons (14%).

Effective as of April 28, 1959, the prices of certain consumer goods and foods were reduced by the following percentages: various types of bread and flour, 12–21%; milk and various dairy products, 3–10%; cotton garments, thread, rope, aluminum utensils, glass, and nails, 5–10%; macaroni, 12%; potatoes, 17.6%; and soap, 10%. At the same time, the government increased the prices paid to producers by 100% for wheat, 133% for rye, 117% for corn, 200% for beef and mutton, and 100% for wool. Deliveries of compulsory quotas were discontinued for beans, rice, and eggs, and in the future the government will purchase these goods on a contractual basis. The government also announced that farmers joining collectives before May 1, 1959, will be forgiven arrears in compulsory deliveries and taxes.

About 50% of Albania's foreign trade is with the Soviet Union, and 47% is with other Communist nations. At various times since 1948 the Soviet Union has advanced to Albania substantial grants and loans, as well as deliveries of consumer and capital goods.

Principal Events, 1959.—Albania's relations with neighboring Yugoslavia remained strained or cool during most of the year. On March 1, Enver Hoxha, first secretary of the Albanian Workers' Party, criticized Yugoslav President Tito for "conspiring with King Paul of Greece to dismember Albania." On several occasions Albanian spokesmen attacked Yugoslavia for mistreating the Albanian population of Kosovo-Metohija and for violating Albania's territorial waters. On March 14, Yugoslavia recalled her ambassador at Tiranë, Arso Milatović, despite the fact that on February 20 the two countries had concluded a trade agreement. Albania, too, recalled her ambassador, Piro Koci, from Belgrade; but relations improved somewhat later in the year, and in August Piro Koci returned to his post.

Relations with Greece were even worse. In March there was a frontier incident involving the death of one Albanian soldier. On March 30 the Albanian government sent Greece a note protesting the alleged violation of its territory. In the Greek press there were repeated references to the persecutions suffered by the Greek minority in North Epirus.

The most important event during the year—described by Enver Hoxha as "the greatest event in Albanian history"—was the visit of Soviet Premier Nikita S. Khrushchev on May 25–June 4. Accompanied by Soviet Defense Minister Rodion Malinovsky and other high-ranking Communist dignitaries (including Premier Otto Grotewohl of East Germany and Marshal Peng Teh-huai, defense minister of the Chinese People's Republic), the Soviet leader toured the country and was greeted by large crowds in Tiranë, Korçë, Vlonë, and Gjinokastër. The apparent purpose of the visit was to warn Italy about her decision to install NATO missile bases on her territory and to persuade Greece to avoid a similar decision. The Soviet premier said that if his warnings went unheeded, missile bases would be installed in Albania, from which both Greece and Italy would be annihilated in the event of war.

The joint Albanian-Soviet communiqué issued at Tiranë on June 1 proposed the immediate cessation of nuclear armaments production and tests, and a nonaggression pact between NATO and the Soviet bloc. On June 30, Mehmet Shehu repeated the Soviet proposals and suggested the establishment of a neutral zone in the Balkan area.

An agreement between Albania and the USSR signed on July 3 provided for a loan of 300 million rubles ($75 million) to finance the construction of Albanian hydroelectric plants, transportation facilities, and a pipeline. Payment by Albania of other Soviet loans, which totaled 522 million rubles ($130.5 million) by late 1957, had been canceled previously. On January 16, Albania agreed to contract a long-term loan from Communist China totaling 55 million rubles ($13.7 million) for the period 1961–65, and a trade agreement between the two countries was also signed.

Associate Professor of History,
The University of Texas.

ALBERTA. Fourth largest of the ten Canadian provinces, Alberta has an area of 255,285 square miles, of which 6,485 are water. It is bounded by Saskatchewan on the east, British Columbia on the west, Montana on the south, and the Northwest Territories on the north.

Population.—The estimated population as of Sept. 1, 1959, was 1,253,000 (1956 census, 1,123,116), and by national origin is 48% British, 17% American, 11% German, 9% Ukrainian, 7% Scandinavian, and 5% French. Principal urban centers (with 1959 estimated populations) are Edmonton, the capital (303,000); Calgary (240,000); Lethbridge (32,780); Medicine Hat (21,740); and Red Deer (17,594).

Government.—A lieutenant governor is appointed by the Canadian government to administer the province; he is aided by an elected Legislative Assembly of 65 members, 13 of whom form the Executive Council. Dr. John J. Bowlen has served as lieutenant governor since 1950, and Ernest C. Manning has served as premier since 1943. The Social Credit Party, which first came into power Aug. 22, 1935, was returned in a landslide victory in the provincial election of June 18, 1959, capturing 61 of the 65 seats. In the federal Parliament, Alberta is represented by 17 members elected to the House of Commons and by 6 appointed senators.

Education.—The provincial Department of Education supervises public education. There are 4,112 school districts, most of which are grouped in 59 school divisions (counties and consolidated units). In 1958 school enrollment totaled 247,219, and classrooms numbered 8,729. A correspondence school branch for those areas of Alberta and the Northwest Territories without organized school facilities served 9,315 pupils. A Provincial Institute of Technology and Art at Calgary and schools of agriculture at Olds and Vermilion are also maintained. Teacher training is supervised by the Faculty of Education of the University of Alberta at Edmonton; the university offers degree programs in the arts and sciences. In addition to public facilities, 55 recognized private schools provide instruction for 5,092 pupils.

Religion.—Alberta's largest religious group is the United Church of Canada, followed by the Church of England in Canada (Anglican), the Roman Catholic, and Eastern Orthodox communions. Lutherans, Baptists, Presbyterians, and Mormons are also represented.

Finance.—Estimated revenue for the fiscal year 1959–60 was $261,279,230; expenditures were estimated at $309,676,358. Funded debt of the province was $29,152,119 as of Dec. 31, 1958, compared with the peak of $167,000,000 in 1936.

Transportation and Communications.—Three railway systems serve the province—the Canadian National, the Canadian Pacific, and the Northern Alberta. There are 5,734 miles of railroad and more than 41,000 miles of graveled and hard-surfaced highway. Alberta is on air routes to northern Canada and the Orient, and is served by the Canadian Pacific, Trans-Canada, Northwest, and Western airlines. The telephone system is owned and operated by the province, except at Edmonton. Most rural telephone lines are operated by mutual companies.

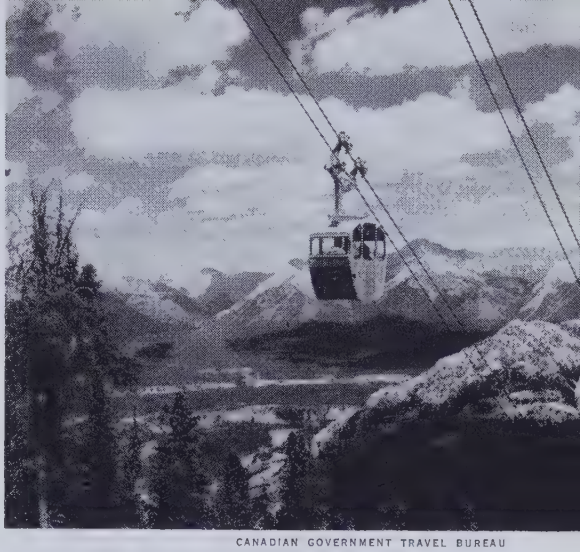
Production.—Agriculture continues as the most important activity in the economy of the province; its value increased by $75 million in 1958 to total $664,762,000. The value of field crops was $340,530,000; livestock, $235,400,000; and livestock products, $88,832,000. Largely because of the curtailment of crude oil shipments from the province, mineral production in 1958 declined by more than $71 million to $338,790,192. The value of crude oil produced during the year was $281,500,000, a decrease of $74 million. Natural gas production in 1958 was 245.5 billion cubic feet, valued at $18,412,500. Figures for the first quarter of 1959 showed increases of 13% in petroleum production and 23% in natural gas production.

Manufacturing.—The gross value of products manufactured in Alberta in 1958 was $808.5 million, an increase of $46 million over 1957 and $105 million over 1956. Major growth was shown by the foods and beverages industry, whose sales increased by $22 million to a total of $330 million. Other important groupings were petroleum and coal products, $151 million; wood products, $58 million; and iron and steel products, $57 million. Approximately 40,000 Albertans are employed in manufacturing.

Trade and Commerce.—Oil, natural gas, and petroleum products are sold locally and are exported to other provinces and the United States. Lumber products and fish are also exported. In 1958 retail trade increased by 3% to $1,248 million; wholesale trade increased by $26 million to a total of $824 million.

Principal Events, 1959.—The Social Credit Party was returned to office in the provincial general elections of June 18, electing 61 representatives to the 65-seat Legislative Assembly. The Liberal, Progressive Conservative, Coalition, and Independent Social Credit parties each elected one member. The vote for the Social Credit Party in 1959 increased to 227,835 from 175,553 in 1955, while the Progressive Conservatives jumped to 94,391 from 34,757, the Liberals fell to 56,728 from 117,741, and the Cooperative Commonwealth Federation Party vote dropped to 18,387 from 31,180.

Paving was completed on the Alberta portion of the highway which leads from the United States boundary in Alberta to Alaska. A system of 200 campsites in the province was completed to accommodate the mushrooming popularity of camping holidays. The sites feature kitchen shelters, stoves, free firewood, and sanitary facilities. The Alberta government has announced plans for a new park area to be known as Wilderness Provincial Park, near the province's western boundary and north of Jasper National Park. The 2,100-square-mile area of mountains and lakes is in a region noted for its superb scenery and abundant wildlife, and will be open for hunting and fishing. A new gondola lift at Banff National Park carries up to 460 passengers per hour, in 38 glass-enclosed gondolas, to the peak of Sulphur Mountain (7,487 feet).



CANADIAN GOVERNMENT TRAVEL BUREAU

Passengers thrill to the vistas of Banff National Park from new gondola lift installed on Sulphur Mountain, Alberta.

A new townsite has sprung up in the wilderness of northwestern Alberta in the vicinity of a new oilfield which shows promise of becoming the most important in the province. The town of Swan Hills is expected to reach a population of 1,000 within the next two years.

The Canadian Army's Western Command at Edmonton was broadened on September 1 to include the Manitoba and Saskatchewan areas which previously came under the eliminated Prairie Command.

A highlight of the year was the visit of Queen Elizabeth II and Prince Philip. The provincial government's present to the queen on the occasion of her visit was a $910,000 student scholarship fund designated as the "Queen Elizabeth Education Scholarship Fund." The program ensures that no needy student with even a moderately good scholastic average will be barred from a higher education because of lack of finances.

H. E. Martin,
Director of Publications, Department of the Provincial Secretary, Province of Alberta.

ALCOHOLIC BEVERAGES. See Brewing Industry; Distilling Industry; Wine.

ALCOHOLISM. Terminology.—Scientific research on alcoholism and related problems has long been handicapped by a vague and imprecise terminology, by a lack of accurate methods of measurement, and especially by an absence of useful theoretical models. During 1958–59 considerable effort was expended on attempts to clarify and standardize for scientific use the language in which the problems of alcohol are discussed, and in adapting and constructing potentially useful theoretical models for future research use.

Some important first steps toward language reform were achieved through the publication of a

preliminary usage dictionary of the alcohol language and a series of papers which made some useful and provocative suggestions as to how order and clarity might best be brought into this difficult area. This work is considered to be of fundamental importance, for until the state of anarchy in terminology is corrected there can be little agreement about the nature and magnitude of the problem, or what should be done about it.

Prevalence.—Information concerning the number of alcoholics and their distribution throughout the general population is not only of considerable theoretical importance but is also vital to the development of realistic treatment and prevention programs. The most widely used method for estimating the prevalence of alcoholism has been the Jellinek Estimation Formula, which is based on the relationship of alcoholism to cirrhosis of the liver. The majority of estimated rates of alcoholism for various countries and regions within countries have been derived from the Jellinek Formula. However, a series of recent studies concerned with a critical examination of the various factors which make up the formula have shown that in general it seriously underestimates prevalence.[1]

This underestimating would not be too serious if the amount of error was predictable, but unfortunately it is not. Estimated rates of alcoholism based on the formula are therefore of questionable validity and must be interpreted with caution. Suggestions have been made for revising the formula, but to implement these would require costly and difficult investigations which would have to be repeated at frequent intervals over time and space. Since such costly studies are just what the formula was designed to avoid, there is general agreement that a new, more economical, indirect method of providing estimates must be developed.

Treatment.—In the treatment of alcoholism the most dramatic development of 1959 was, perhaps, the advent of citrated calcium carbimide (Temposil), a new deterrent drug with an action similar to but much milder than that of disulfiram (Antabuse). Although Temposil was not designed to replace Antabuse, clinical studies have shown that under medical supervision it can be used safely to prevent relapses in patients for whom the older drug was unsuitable.

Those who are responsible for the treatment and rehabilitation of alcoholics have become increasingly concerned about the results of their efforts. An impressive variety of treatment procedures has been employed with widely varying claims of success. Due to an embarrassing shortage of sound evaluation studies, such claims have not been scientifically substantiated. During 1959 a very considerable amount of research effort was devoted to seeking solutions to some of the extremely complex, practical, and theoretical problems involved in assessing treatment methods.

Traffic Accidents.—Two recent studies bearing on the relationship of alcohol and alcoholism to traffic accidents suggest that traffic accidents involving drivers who had been drinking may be, to a hitherto unsuspected degree, a problem of alcoholism rather than largely a problem of the effects of alcohol on the casual drinker. This finding has a number of implications for accident prevention programs. Such programs are designed to reach the largest possible segment of the population. The underlying assumption is that most "accident precipitating" factors are ultimately in the control of the driver and can be affected by simple suggestions, such as "if you drive, don't drink." It has been amply demonstrated that simple suggestions or exhortatory appeals have been of little value in the therapy of alcoholism. On this basis it might be concluded that highway education slogans would hardly affect drivers whose very abnormality immunizes them against such appeals.

ROBERT J. GIBBINS,
Director of Psychological and Psychiatric Studies, Alcoholism Research Foundation, Toronto.

[1] Existing estimates indicate that there are 5 million alcoholics in the United States, representing a rate of 4,360 per 100,000 population. This incidence is higher than that of any other major nation except France, where it is estimated at 5,200 per 100,000. The United States total is rising at the rate of approximately 200,000 cases annually.

ALEUTIAN ISLANDS. Extending some 1,200 miles westward from the mainland of Alaska, of which state it is politically a part, this island chain encompasses some 14 large and 55 small islands totaling 6,821 square miles. Chief component island groups are the Fox, Andreanof, Rat, and Near, and the Islands of the Four Mountains. The population of 5,600 (1950 census) includes mostly military personnel and their families, and fewer than 700 native Aleuts, an Eskimo group.

The U.S. Navy maintains a base on Adak Island and a meteorological detachment on Shemya Island. On the latter, which serves as a refuelling stop on North Pacific air routes to the Far East, the Air Force and Army also maintain facilities, and the U.S. Weather Bureau, an airport weather station.

ALGERIA. A French territory on the Mediterranean coast of Africa. Area, 919,590 square miles (including over 700,000 of desert); pop. (est. June 30, 1958), 10,265,000, chiefly Moslem Arabs and Berber groups. The Moslem population is predominantly Arabic-speaking. The European population, concentrated in the larger cities and coastal areas, totals about 1.2 million, mainly French. Native Jews number about 100,000. Chief cities and populations (1954 census): Algiers, the capital, 361,285; Oran, 299,008; Constantine, 148,725; and Bône, 114,068.

Government.—Algeria has long been governed as part of Metropolitan France. However, under the conditions of the nationalist rebellion (begun in November 1954), Algerian governmental institutions have been in a state of evolution since 1956. On Dec. 16, 1958, Paul Delouvrier was appointed delegate general of Algeria by the Paris government. He is under the minister of interior in Paris and, as head of the civil and military powers in Algeria, executes the policy of the Paris government. Gen. Maurice Challe, appointed at the same time as Delouvrier, is commander in chief of French forces in Algeria and serves as deputy delegate general. For administrative purposes, Algeria is divided into 15 departments (although only 12 had been fully organized by 1959). Two additional departments of the Sahara (Oasis and Saoura) are under the separate Ministry of Saharan Affairs.

As part of Metropolitan France, Algeria is represented in the French National Assembly and Senate. In the elections of Nov. 28–30, 1958, 67 deputies (including 46 Moslems) from Algeria proper (and 4 from the Sahara) were elected to the French National Assembly. On May 31, 1959, 32 senators (22 Moslems) were elected to the French Senate from Algeria (2 Moslems had been elected from the Sahara on May 24). Deputies had been elected by direct popular vote. Senators were chosen by councilors of the municipal and rural councils, which had been constituted by direct popular vote on April 19–26, 1959. (See also below, *Principal Events, 1959.*)

Education.—An estimated 94% of the Moslem population was illiterate in 1948. Between 1945 and 1955, however, Moslem enrollment in public schools trebled, and further gains were achieved after 1955. In 1958–59, primary schools had 612,182 pupils; normal schools, 1,021; technical schools, 18,063; and other secondary schools, 41,984. The University of Algiers had 5,454 students. On Nov. 10, 1959, French President Charles de Gaulle stated that 850,000 pupils were attending Algerian schools, representing a rise of over 50% since 1957.

Finance.—The provisional 1958–59 budget (ordinary and extraordinary) estimated revenue at 289.190 million francs, and expenditure at 289,150 million. Both revenue and expenditure were about 58,000 million francs over the 1957–58 estimates. Under the Constantine Plan (out-

lined by de Gaulle on Oct. 3, 1958), France will allocate a minimum of 100,000 million francs yearly for Algerian modernization and development. In June 1959 the French National Assembly approved a bill providing that the Algerian budget be voted by the French Parliament in Paris, and a bill making Algerian and French currencies legal tender in both areas. (The Algerian franc is equal to the metropolitan franc; a new "heavy" franc, to be called the "new franc" and to be equal to 100 French francs, became effective on Jan. 1, 1960.)

Production.—The economy of Algeria is predominantly agricultural, although the interior area is largely desert and the northern mountainous regions are of marginal value for cultivation. The fertile coastal areas are tilled mainly by Europeans, who have obtained high yields by modern techniques. Farming engages the greater part of the Moslem population as landholders (mostly small proprietors), tenant farmers, farm workers, and seasonal laborers. Moslem cultivation is still largely primitive, although some modern techniques have been spread by the French. A major part of the de Gaulle program for Algeria is land distribution, improvement of cultivation methods, and betterment of the lot of the impoverished rural population. Algeria's chief crops are grains; estimated 1958 yields (in bushels) were: wheat, 45.9 million; barley, 35.8 million; and oats, 5.5 million. Output of wine, Algeria's largest single export, totaled 15.2 million hectoliters in 1957. Other important crops are oranges (prelim. 1958, 8 million boxes), vegetables, olive oil (prelim. 1958–59, 19,000 short tons), figs, dates, esparto grass, pulses, tobacco, and cork. Stock raising (chiefly sheep) yields meat, hides, and dairy products.

Algerian industry is mostly on a small scale, the few large-scale enterprises being operated by Europeans. Principal industries are foodstuffs, textiles, footwear, chemicals, metallurgy, building materials, glass, silk spinning, and tobacco products. Traditional handicrafts (rugs, embroideries, leatherwork, and pottery) remain important for the Moslem population. Electricity consumption in 1959 approximated 1,400 million kw.-hr., or about double that of 1954. Recent discoveries of vast oil and natural gas reserves in the Sahara have rendered Algeria a potentially wealthy minerals producer. Proved reserves at the Hassi Messaoud fields were reported at over 350 million metric tons; and at the Edjelé and nearby fields, over 125 million. The area around Hassi R'Mel is said to contain one of the world's greatest concentrations of natural gas. Crude oil output from the Sahara fields in 1958 was 425,600 metric tons, but production rose considerably in 1959 and was expected to rise even further with the inauguration of the 24-inch, 415-mile pipeline from Hassi Messaoud to the Mediterranean port of Bougie on December 5. Algeria's other important minerals and 1958 output in metric tons were: iron ore, 2,301,600; phosphates, 565,000; lead ore, 14,700; zinc ore, 53,500; and coal, 153,200. (See also IRON AND STEEL.)

Foreign Trade.—Algeria is mainly an exporter of agricultural produce and minerals, and an importer of manufactured goods. Exports in 1958 totaled 205,149 million francs (up 19% over 1957); imports, 478,834 million (up 25%). Chief exports were wine (112,232 million francs), citrus fruits (13,777 million), iron ore (10,916 million), and fresh vegetables (6,727 million). Principal imports were vehicles, agricultural and other machinery, petroleum and its products, sugar, and other manufactures. France purchased 85% of Algeria's 1958 exports, and provided 84% of imports.

Transportation and Communications.—The Algerian railroad system, which had 2,700 miles of track in operation in 1957, is connected with the Moroccan and Tunisian networks. The highway system in 1957 included 5,962 miles of national roads, 8,880 of departmental, and 7,967 of other main roads, in addition to several thousand miles of byroads and desert tracks. Algeria has over 180 airports, including 3 (Algiers, Oran, and Bône) of international class. Passenger cars numbered 137,146 in 1958; telephones, 153,275; licensed radio sets, 407,000 (1957); television sets, 3,000 (July 1957); daily newspapers, 9 (1956; total circulation, 283,000).

Principal Events, 1959.—The first promising basis of a settlement of the Algerian nationalist rebellion emerged in 1959, the fifth year of costly warfare. On Sept. 16, 1959, French President Charles de Gaulle offered the Algerian people the right of self-determination, including, if they so willed, independence from France. The rebel leaders accepted the principle of the offer, but rejected the circumstances and conditions prescribed by de Gaulle for its implementation. As the year drew to a close, a common ground for cease-fire conversations had not yet been found, and the fighting continued without abatement.

De Gaulle's statement, enunciated in the form of a radio and television address to the people of France and Algeria, offered the Algerians the choice of integration with France, autonomy

WIDE WORLD

Ferhat Abbas (*center*), premier of the Algerian rebel government, meets in Tunis with two of his ministers, ben Guettar (*left*) and ben Tobal, to discuss President de Gaulle's September 16 proposal concerning future of the country.

within a form of association with France, or independence. The people of Algeria, both French and Moslem, would express their choice in the form of a referendum to be held within four years after the peace—"peace" being held to prevail when fewer than 200 persons had been killed through ambushes or other incidents in a year. The French president spoke glowingly of the advantages of integration or autonomy, describing France's ambitious plans for Algerian development and modernization. The "incredible and disastrous" choice of independence, however, would mean the loss of French aid, "appalling poverty," and "abysmal political chaos." Independence would require the protection of the French community through some form of partition, and France would retain control of Saharan oil and other resources. By his omission of any mention of the Algerian National Liberation Front or the rebel provisional regime (set up in 1958), de Gaulle indicated the Paris government's continuing refusal to accept the rebel organization as in any sense a spokesman for the Algerian people. On the other hand, the French president reiterated his proposal of 1958 for "a peace of the brave," and pledged that the leaders of the rebellion would have an equal right with all others to participate in the debate over the future of Algeria.

The leaders of the rebellion were confronted with a difficult choice. If they rejected de Gaulle's offer, they might appear to be rejecting self-determination and blocking peace. If they accepted, it could turn out that they had submitted to conditions rendering the referendum the opposite of

On his tour of Algeria, August 27–30, President de Gaulle acknowledges welcome of Moslem crowd at village of Saida.

WIDE WORLD

a freely expressed choice—for the events of the past year had shown that a Moslem majority could easily be produced for French-sponsored proposals, as long as the French Army was obtrusively present at every polling booth. On September 28 the Algerian Provisional Government gave its answer in a communiqué read by Premier Ferhat Abbas in Tunis. The rebel regime accepted the principle of Algerian self-determination and declared it was ready to discuss the "political and military" conditions of a cease-fire, as well as the "conditions and guarantees" of the application of self-determination. The rebel statement further declared that the provisional regime was the spokesman of the Algerian people until they freely expressed themselves. The rebels rejected the possibility of partition, and insisted that Saharan resources belonged to Algeria. The French government made no official response to the rebel statement. In the months that followed, the question of whether the rebels were to have a role in deciding the actual conditions of self-determination emerged as the key issue separating the two sides.

The de Gaulle offer of September 16 climaxed more than a year of bold efforts by the French leader to convince the Algerians that they had "every moral and material reason to want to be united with France." In accordance with the Paris government's program for Algerian political reform, elections for municipal and rural councils took place in most of Algeria from April 19–26, with over 60% of the registered voters going to the polls. Of the 13,995 councilors elected, 11,558 were Moslems, and Moslem majorities were elected to all but four of the councils. Indirect senatorial elections on May 31 for Algerian representatives to the French Senate marked a victory for the liberals among both French and Moslems, and a defeat for the rightist extremists among the French.

Substantial measures were taken in 1959 for the implementation of de Gaulle's Constantine Plan (announced on Oct. 3, 1958). A High Council for the Constantine Plan and a Fund for the Development of Algeria were established, and the equivalent of $365.2 million was expended during the year for the expansion and modernization of agriculture, industry, and transport, and the improvement of education and health conditions. Minimum wages were raised and social security benefits increased. The emancipation of Moslem women was furthered on February 10, when President de Gaulle signed a decree providing that Moslem women could not be married without their consent, nor divorces granted except through the divorce courts.

The de Gaulle approach to the Algerian problem also had another side, illustrated in the president's warning that if the rebels refused to accept a cease-fire, the fighting would simply come to an end for lack of combatants. Under Gen. Maurice Challe, French commander in chief in Algeria, the French forces of nearly 500,000 were shifted in increasing numbers from garrison duties to mobile thrusts against rebel mountain strongholds. In a large-scale offensive in March and April, Challe used paratroopers and other mobile units against the rebels in the Ouarsenis area of west-central Algeria, and in late July, Challe mounted the greatest offensive of the war against rebel bands in the mountainous Kabylia region east of Algiers. In September, Challe declared that the rebels had lost 4,400 men in the Kabylia region and that French units had taken over areas under rebel control for years. Smaller engagements occurred throughout the year in almost every section of the country, including the border regions, where newly trained and equipped rebel units from Tunisia and Morocco sought to penetrate French electrified barbed-wire lines and other defenses.

According to French accounts, the accumulating heavy losses had virtually sapped rebel strength. Rebel morale was said to be low, dissension rife, and surrenders increasing. In late March, French authorities reported the death of Colonel Amirouche, rebel commander of the Kabylia stronghold and one of the most capable of rebel military leaders. On November 6 the French announced the death of Major Mira, Amirouche's successor, and stated that all six rebel military zones were without commanders. As the fighting entered its sixth year in November, de Gaulle reported that total rebel dead numbered 145,000, as compared with 13,000 French soldiers; civilian deaths were given as 12,000 Moslems and 1,800 French.

French claims of rebel demoralization were denied by rebel leaders, who asserted that their forces had become more numerous and better equipped with each passing year, and that world opinion was swinging more and more behind the cause of Algerian independence. The provisional rebel government, which has its headquarters in Cairo but operates largely out of Tunis, continued to receive financial and arms support from Arab League members and other sources. A rebel mission toured Communist China in April, allegedly obtaining promises of arms aid. Premier Ferhat Abbas visited Saudi Arabia in March, India and Pakistan in April, and Yugoslavia in June, obtaining expressions of sympathy for the independence struggle. A conference of nine independent African states, meeting at Monrovia, Liberia, from August 4–8, called for world support of the rebel cause.

At the United Nations, a Pakistani-sponsored resolution calling for recognition of the right of Algerian self-determination and the holding of informal peace talks fell short of the required two-thirds majority in the General Assembly on December 12.

ALIENS. See Index entry.

ALLERGIES. Pollinosis.—For 50 years the basic treatment of pollinosis, when it affected the eyes and nose (hay fever) or when it caused wheezing (bronchial asthma), was the injection of a salt water extract of the causative pollen administered at intervals of one week to one month. As a result of clinical studies initiated in 1938, involving critical evaluation of every aspect of such treatment, new techniques of testing patients and of treating them were discovered. Chief among these was the injection of a new type of extract in the form of a fine emulsion. A single annual injection of emulsified pollen extract can be administered two to 16 weeks before each pollen season (*Annals of Allergy*, 16:381, May 1958; 17:358, May 1959). In nine of 30 studies, Brown reported on results following more than 5,000 such injections. The results are apparent in two weeks and the injection is not only safer than that of the salt water extract but the effect is longer lasting.

Under investigation are more purified extracts, better emulsifying agents, an improved oily vehicle, radioactive pollen for surveys, radioisotope-tagged pollen molecules for the study of hay fever patients, and enzyme studies of the allergic state.

Asthmatic Bronchitis.—Allergic and nonallergic asthmatic patients suffer more severe symptoms

when afflicted with colds. The A, B, and Asian influenza viruses can be given in emulsion form in two injections three weeks apart for protection lasting from three to five years. A slightly different emulsion has been used to protect almost 100,000 military personnel. No good bacterial vaccines have as yet been prepared, and bacterial infections must, as before, be treated by antibiotic agents, especially penicillin.

Penicillin as used today causes many types of allergic reactions in 5% to 15% of allergic patients and 2% to 5% of nonallergic patients. Currently in process of manufacture is a nonallergenic type of penicillin free of adverse effects. Also available is a penicillinase which neutralizes the untoward reactions of standard penicillin. Its injection will not reverse the damage done by penicillin but will prevent further harm.

Dermatologic Allergy.—Basic studies to discover original causes of eczematoid dermatitis are as necessary as ever, but cortisone derivatives, taken orally and applied locally, give immediate and dramatic, although temporary, relief. Available in a suspended-emulsified form, a single injection of methyl prednisolone replaces the former complex schedules with a painless injection effective for three to 20 days.

Bronchial Asthma.—In 1958 the results of certain asthma studies initiated in 1941 were published. These showed that between attacks, the lungs of asthmatic patients were not normal, although by stethoscopic examination the physician might have considered them to be free of spasm. Treatment with mild antispasmodic drugs taken prophylactically prevented insidious irreversible damage to the lungs of such bronchospastic patients (*Mississippi Valley Medical Journal,* 81:81, 1959). A new mixture, one of methyl and methoxy-phenamine-hydrochloride, has been found useful in victims of bronchial asthma, because less of the corticosteroid is then needed. Similar mixtures of corticosteroid hormones and tranquilizing agents have been used.

Psychogenic Factors.—In any disorder associated with spasm, intensification or, in conditioned patients, repetition of the symptoms can occur following tension, fatigue, emotional stress, or subconscious psychological states. In asthma, the respiratory rhythm is disturbed and remains abnormal between attacks. By means of hypnosis, the physiological respiratory rhythm can quickly and permanently be restored in such bronchospastic patients. The patients then go into and out of an attack of such bronchospasm at will and can relieve, in part or in whole by themselves, this part of their disorder. Such "synaptic ablation" is not effective in true allergically caused spasm. In eczema, itching and therefore scratching can rapidly be brought under control.

Antihistaminic Agents.—Parallel with the discovery of such new corticosteroid hormones as dexamethasone, other new antihistaminic drugs have become available for safer short-term relief of nasal allergy, urticaria, and other types of allergic responses. The latter include d-Chlorpheniramine maleate (Polaramine), dibrompheniramine maleate (Disomer), isothipendyl hydrochloride (Theruhistin), and parabromdylamine maleate (Dimetane).

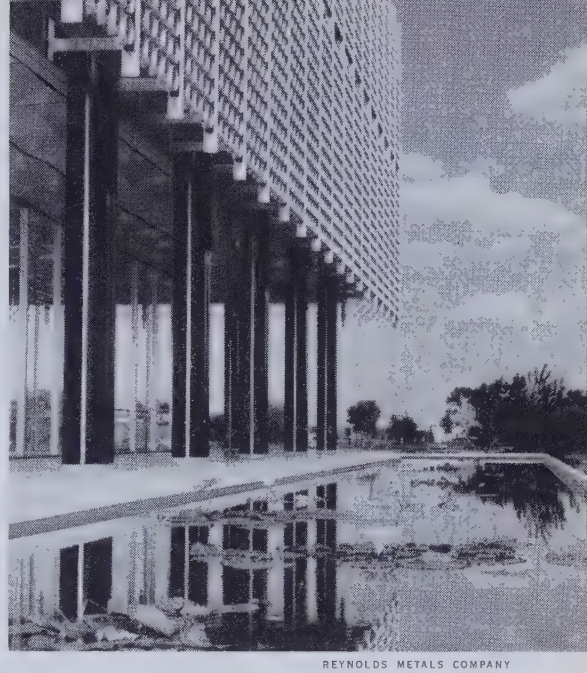
Editor of "Annals of Allergy" and of "Review of Allergy and Applied Immunology"; Director, Asthma Research Foundation, Boston.

ALUMINUM. Output.—Production of primary aluminum in 1958 was 1,565,557 tons in the United States and a record 646,000 tons in Canada. Total United States production in 1959 was expected to top the previous 1956 high by at least 15%, with Canadian output in 1959 being 5–10% lower than in 1958. (See also MINERAL PRODUCTION.)



REYNOLDS METALS COMPANY

Anodized aluminum sun screen provides an airy façade for Detroit headquarters building of Reynolds Metals Company.

Industry Growth.—Additional primary smelting capacity was installed in Canada and the United States during 1959. Canadian British Aluminium Co., Ltd. completed installation of its initial production facilities at Baie Comeau, Quebec. Kaiser Aluminum & Chemical Corporation began producing aluminum from the last two lines of its smelter at Ravenswood, W.Va., and Ormet Corporation started the last potline at its Omal, Ohio, smelter. In July, Reynolds Metals Company started operations in a new smelting plant at Massena, N.Y. This plant supplies hot metal to an adjacent foundry operated by the Chevrolet Division of General Motors Corporation.

Consumption and Uses.—Aluminum consumption in the United States, as measured by shipments of products to consuming industries, established a new record during 1959, eclipsing the previous 1956 high by about 17%. The momentum of the general business recovery was accentuated in the aluminum industry during the first half of 1959, when shipments were 53% higher than in the comparable period of 1958 and 26% above those of the last half of 1958. Aluminum shipments dropped to a lower level in the latter half of 1959, reflecting the accumulation of inventories during the first seven months and the reduced industrial production caused by the steel strike.

The largest single development in the residential building industry during 1959 was the eager public acceptance of aluminum dwellings, particularly the Viking Line models of National Homes Corporation, the nation's largest builder of prefabricated houses. An estimated 20,000 aluminum-clad houses were built in 1959, compared with approximately 500 in 1958. (See also ARCHITECTURE.)

Aluminum usage in the average automobile continued to increase, reaching an estimated 51 pounds in 1959 models. The outstanding development in this field was the adoption of an aluminum engine for the Corvair, Chevrolet's entrant in the

small car field. (See also AUTOMOBILES.)

Aluminum made steady gains in the packaging field during 1959. Especially promising was increasing acceptance of aluminum by can manufacturers and its adoption by their customers for oil and beer cans. Aluminum screw-on caps for baby food jars were popular with American housewives. Greater use of aluminum household foil was enhanced by the introduction of an alloy with improved strength.

The railroad industry exhibited growing interest in aluminum during 1959. One railroad ordered 1,205 aluminum gondola and covered hopper cars. Another ordered 50 of its box cars to be equipped with aluminum linings. Other growing aluminum applications include lading bars, refrigerator car components, signs and crossbucks, and piggyback trailers and containers.

During 1959 the Aluminum Company of America paved the way for large-scale usage by oil companies of aluminum pipe with the development of a portable, high-speed, automatic pipe-welding machine capable of producing sound welds without the use of back-up rings, thereby cutting pipe-laying time. Also expected to spur the growth of this market is a new economical, seamless, tubular aluminum product that provides for efficiently welded joints by having a thicker wall at pipe ends than along the length. (See also METALLURGY.)

Foreign Competition.—In common with the steel industry, the United States aluminum industry encountered growing competition from foreign producers and fabricators in 1959. United States imports of primary aluminum from Canada declined from 1958, but the influx of base metal from European countries increased sharply. Imports of aluminum mill products also rose markedly in the first seven months of 1959, exceeding the total for the entire year 1958.

Exports.—Canada is the world's largest exporter of primary aluminum (482,927 tons in 1958), followed by the USSR (126,000 tons), Norway (121,056 tons), France (55,202 tons), and the United States (52,711 tons). The free world's leading exporters of semifabricated aluminum are the United Kingdom (39,680 tons in 1958), Belgium-Luxembourg (29,034 tons), West Germany (27,597 tons), Canada (17,560 tons), and the United States (15,815 tons).

AMERICAN ACADEMIES AND ASSOCIATIONS. For organizations whose titles begin with the word American (excepting American Federation of Labor and Congress of Industrial Organizations, and American Library Association, which are reviewed below) see the article SOCIETIES AND ORGANIZATIONS.

AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS. AFL-CIO membership during the biennium ending June 30, 1959,

averaged 12,671,000, a decrease of 80,000 from the previous 2-year fiscal period. The figures are based on per capita tax paid to the federation by its 135 affiliated international unions and 507 directly chartered locals.[1]

Administrative Matters.—George Meany, president, and William F. Schnitzler, secretary-treasurer, were re-elected to new 2-year terms at the AFL-CIO's San Francisco convention, Sept. 17–23, 1959. In addition, all incumbent members of the AFL-CIO Executive Council were re-elected, including Maurice A. Hutcheson, president of the United Brotherhood of Carpenters and Joiners.[2] Headquarters remains at 815 16th Street, N.W., Washington 6, D.C. Regional offices are operated in 23 cities.

Net worth of the organization on June 30, 1959, was $7,774,000, a decrease of about $150,000 since 1957. Operating expenses in the 1959 fiscal year amounted to $9,232,000, an excess of $182,700 over income.

Merger of former AFL and CIO state organizations by the end of 1959 had failed of achievement only in New Jersey and Pennsylvania. Among international affiliates, the American Wire Weavers Protective Association merged with the United Papermakers and Paperworkers (March 31), and the Insurance Agents International Union and the Insurance Workers of America united (May 25–26) under the name of the IAIU.

On matters involving ethical practices, which so plagued the AFL-CIO in 1958, the Executive Council put two directly chartered locals in Barberton, Ohio, and Elizabeth, N.J., under trusteeships. A third local, in Chicago, was continued in this status.

Conference on Unemployment.—Early in 1959 the AFL-CIO exhibited great concern over the economic situation. To dramatize its contention that greater governmental attention should be directed to shoring up the economy and accelerating its expansion, the Executive Council at its winter meeting (in San Juan, Puerto Rico, February 16–24), partly on the insistence of Walter P. Reuther, president of the United Automobile Workers, authorized sponsorship of a conference on unemployment to be held in Washington, D.C., on April 8. Although about 7,000 delegates met at the ensuing conference, an announcement a day earlier by the Labor Department of a more than seasonal decline in unemployment of nearly 400,000 dampened the current significance of the meeting.

Reform Legislation.—During 1959 the federation was fighting a strenuous if losing congressional battle against a union control law more stringent than the Kennedy-Ives bill, which it supported. But the successive exposures of union corruption by the Senate Select Committee on Improper Activities in the Labor or Management Field (even though applicable to a relatively few organizations), plus a sustained campaign by management groups, led finally to passage on September 3–4 of the Labor-Management Reporting and Disclosure Act of 1959 (also called the Labor Reform Act of 1959). The measure, patterned after the House's Landrum-Griffin bill, was signed into law by President Eisenhower on September 14, three days before the AFL-CIO opened its September 17–23 convention in San Francisco.

UPI

AFL-CIO President George Meany addresses a United Steelworkers union meeting on April 30. David McDonald (foreground) led the union in nationwide steel strike in 1959.

San Francisco Convention.—It was this bitter fruit of labor's congressional election "victory" of 1958, plus other bleak factors, which accounted for the defensive posture apparent at the San Francisco convention in September. The steel strike was already in its third month, with negotiations stalled. Secretary of Labor James P. Mitchell had told the delegates that a Taft-Hartley Act injunction was in the offing to open the struck mills. Pervading the atmosphere was a fear that a defeat in steel would encourage a general assault on labor's gains. Organizing efforts had been stalled since the last convention, and internally the AFL-CIO had been beset during the year with jurisdictional and factional strife.

It appeared, however, that these very adverse circumstances confronting the organization created a determination for more unified and vigorous action on several fronts.

The new labor law was characterized as "a severe setback" and "designed to destroy organized labor," and a resolution warning that no political party could take labor's support for granted was widely interpreted as a criticism of Democratic leadership in Congress. While pledging obedience to the new labor law and acknowledging the need for reform legislation, the AFL-CIO resolved to work on the political front for repeal of "all laws which . . . hamper the growth of the American labor movement."

Progress Toward Unity.—The AFL-CIO's attitude and actions in relation to the steel strike epitomized organized labor's declared belief that it was facing "a struggle for the survival of the entire labor movement." The convention took the unusual step of setting up a Steelworkers Defense Fund to be financed by an hour's wage a month from each member of each affiliated international union for the duration of the strike. In addition, cash donations ranging up to $1 million were announced from organizations widely representative of affiliated unions. A noteworthy pledge of support came from the Building and Construction Trades Department, bitter opponent of the Steelworkers union in still unresolved jurisdictional feuds.

President Meany's call for labor harmony led to a resolution authorizing the Executive Council to develop "a detailed plan of procedure for the settlement of [jurisdictional] disputes . . . embodying final and binding arbitration as the terminal point in the settlement. . . ." In addition, the Executive Council was directed to call a special convention (to be held in 1960) to ratify such a plan and to make the constitutional amendments necessary to its effectiveness.

Other manifestations of unity announced at the convention included merger of the Maritime Committee with the Maritime Trades Department, a result of the new work-

[1] Comparative membership figures are adjusted to allow for the expulsion in December 1957 of 3 affiliates (and 1 continued on probation) with an aggregate membership of approximately 1.5 million.

[2] Hutcheson was indicted on Oct. 20, 1959, on a charge of contempt of Congress for refusing to testify before a Senate committee concerning a highway land-purchase scandal in Indiana. He had been under indictment since Feb. 18, 1958, in that case, but had never been brought to trial. The AFL-CIO Executive Council also launched an inquiry into the matter, but Hutcheson failed to appear for questioning.

ing relationship (forced by joint opposition to "flags of convenience" ships) between Presidents Joseph Curran of the National Maritime Union and Paul Hall of the Seafarers. The Machinists, Transport Workers, Air Line Pilots, Flight Engineers, Air Line Dispatchers, and Railway Clerks formed a coordinating body dedicated to consider joint problems. The International Longshoremen's Association (ILA), expelled from the old AFL in 1953 for racketeering, was offered (and accepted) probationary affiliation for two years.

Perennial resolutions on a long list of domestic and international matters were passed, but the AFL-CIO retreated somewhat from its traditional unqualified support of the government's reciprocal trade agreement program. This action reflected persistent unemployment in industries feeling the pinch of import competition, such as shoes, clothing, textiles, and pottery.

The per capita tax for directly affiliated locals was increased from $1 to $1.50, and salaries of the president and secretary-treasurer were each raised by $10,000 a year, to $45,000 and $43,000, respectively.

LAWRENCE R. KLEIN,
Editor-in-Chief, "Monthly Labor Review."

AMERICAN LIBRARY ASSOCIATION. The American Library Association (ALA) is an organization of libraries, librarians, trustees, and others interested in the development and improvement of library services. It functions—through an organization involving about 1,250 of the members and a headquarters staff of more than 100—by establishing standards of various kinds, holding annual and midwinter conferences, operating a nonprofit publishing program, and administering special projects supported by foundation funds. A Washington office maintains liaison with federal agencies.

As the chief spokesman for the modern library movement in North America, ALA has grown as libraries themselves have done. In 1959 there were three noteworthy marks of this growth: (1) membership in the association passed 23,000 for the first time in its 83-year history; (2) the annual conference, held in Washington, D.C., June 21–27, was the largest of the 78 meetings that have been held since 1876, with a registered attendance of 5,346; and (3) a new headquarters building, the first to be designed specifically for ALA use, was planned to replace the present structure at 50 East Huron Street, Chicago, and was to be ready for occupancy in 1961.

Income.—The total income of ALA in 1958–59 was $1,439,098, of which $291,505 was from membership dues, and the rest from endowment income and grants for special projects. Endowment capital was about $2,750,000.

Conferences.—The theme of the Washington conference was "The World of Books." The annual midwinter meeting was held in Chicago on Jan. 27–30, 1959. A joint conference with the Canadian Library Association was scheduled for Montreal, June 19–25, 1960, and an ALA conference for Cleveland, Ohio, July 9–16, 1961.

Officers.—Officers who assumed their duties at the Washington conference were: president, Benjamin E. Powell, Duke University Library, Durham, N.C.; first vice president and president-elect, Mrs. Frances Lander Spain, New York Public Library; second vice president, John T. Eastlick, Denver (Colo.) Public Library. Richard B. Sealock, Kansas City (Mo.) Public Library, began the last year of his four-year term as treasurer.

Standards.—Notable progress in formulation and publication of standards was made in 1959 by units of the ALA. Standards for school library programs, prepared by the American Association of School Librarians, were approved for publication early in 1960; standards for college libraries, prepared by the Association of College and Research Libraries, were approved and published; and standards for undergraduate library education, prepared by the Committee on Accreditation, were approved.

Library Technology Project.—A different approach to standards was illustrated by the Library Technology Project, established in May 1959 for a two-year period under a grant of $136,395 from the Council on Library Resources, Inc. Compilation, editing, and publication of present standards for equipment widely used in libraries was the project's major task in its first phase. The project staff also worked with equipment manufacturers, librarians, and experts in standardization and testing to stimulate the development of new products useful to libraries. By the end of 1959, two supplementary grants from the Council on Library Resources, totaling $22,600, had been made for use in developing a bookmarking machine and other needed products.

National Library Week.—The second National Library Week, held April 12–18, 1959, and sponsored by ALA and the National Book Committee, was an even greater success than the first. The objective of the week is to emphasize the values of reading, and a multitude of local, state, and national activities are planned around this objective. Because of its demonstrated success, ALA decided to continue sponsorship of the week for at least three more years.

Publications.—During 1959 ALA published *Guide to Art Reference Books, Status of American College and University Librarians, College Teaching and the College Library, Cooperative Centralized Processing,* and a number of other books and pamphlets. The monthly ALA *Bulletin* is the official membership journal; *Booklist and Subscription Books Bulletin* reviews trade and subscription publications; and a number of the divisions publish quarterly or bimonthly journals.

Awards and Citations.—The Joseph W. Lippincott Award for distinguished librarianship ($500 and a medal) was presented to Essae Martha Culver, state librarian of Louisiana since 1925. The Melvil Dewey Medal for creative professional achievement of a high order went to Benjamin A. Custer, editor of the 16th edition of the *Dewey Decimal Classification,* 2 vols. (Forest Press 1958).

The 38th Newbery Medal for the most distinguished contribution to American literature for children published in 1958 was won by Elizabeth George Speare for *The Witch of Blackbird Pond* (Houghton Mifflin). Barbara Cooney won the 22d Caldecott Medal for the illustrations in *Chanticleer and the Fox* (Crowell), judged to be the outstanding picture book of 1958 for children.

The biennial Oberly Memorial Award ($100) for the best bibliography in the field of agriculture was won by J. Richard Blanchard, librarian of the University of California (Davis), and Harald Ostvold, chief of the reference department, New York Public Library, for their *Literature of Agricultural Research* (University of California Press 1958).

Justice Francis Bergan of the New York State Supreme Court, president of the board of the Albany Public Library, and Alan N. Schneider, a trustee of the Louisville (Ky.) Public Library, received the annual Trustee Citations of Merit.

The first Isadore Gilbert Mudge Citation for distinguished contributions to reference librarianship was presented to Mary N. Barton, former head of the general reference department of the Enoch Pratt Free Library, Baltimore.

Andrew D. Osborn, librarian of the University of Sydney, Australia, was awarded the Margaret Mann Citation for outstanding professional achievement in cataloging and classification.

The Grolier Society Award ($500) for stimulating the reading of children and young people was won by Evelyn Sickels, formerly coordinator of children's services at the Indianapolis (Ind.) Public Library.

Anita M. Hostetter, former secretary of the ALA Board of Education for Librarianship, won the Beta Phi Mu Award ($50) and citation for distinguished service to education for librarianship.

The Frederic G. Melcher Scholarship ($750) for study in children's librarianship was won by Thusnelda Schmidt of Pittsburgh.

Grolier-Americana Scholarships in School Librarianship, of $1,000 each, were presented to the Louisiana State University Library School (a graduate school) and the Department of Library Science, Montana State College, Bozeman (an undergraduate school) for presentation to students of their choice.

Richard L. Darling of Montana State University, Missoula, received the E. P. Dutton–John Macrae Award

of $1,000 for the advancement of library service to children and young people.

SAMRAY SMITH,
Editor, "ALA Bulletin."

AMERICAN LITERATURE. The year 1959 saw the publication of a number of significant works by distinguished American novelists. William Faulkner's *The Mansion,* in addition to ending the saga of the Snopeses, completed the trilogy which began with *The Hamlet* (1940) and *The Town* (1957). Robert Penn Warren moved back into critical favor with *The Cave,* in which he once again, as in *All the King's Men* (1946), turned a subject of temporary or topical significance into art. *Henderson the Rain King,* a comic fantasy by Saul Bellow, was both hailed as the author's finest novel and described as his worst, by equally perceptive reviewers. John Hersey's *The War Lover,* a tale of tension and anxiety in war, sustained the critical approval created by his earlier novels. Hamilton Basso, in *The Light Infantry Ball,* gained additional admirers by his skillful handling of the illusions of the ante-bellum South.

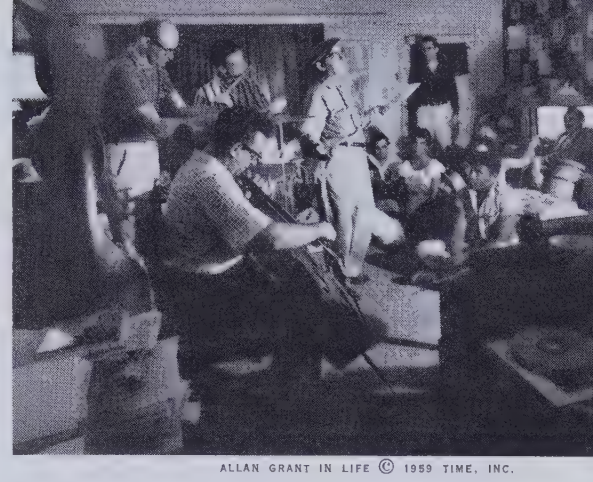
James Jones' *The Pistol* and Pearl Buck's *Command the Morning* were definitely not up to their authors' standard performances. Jack Kerouac kept "beatnik" fiction alive with *Maggie Cassidy,* which was, surprisingly, recognizable as a novel of adolescence. Old-timer Ben Hecht's first novel in 25 years, *The Sensualists,* disappointed his readers. Herbert Gold, with *The Optimist,* continued to build his reputation, as did Louis Auchincloss, with *Pursuit of the Prodigal,* and Shirley Jackson, with *The Haunting of Hill House.*

Although neither controversial nor major literary criticism appeared in 1959, Richard B. Sewall's *The Vision of Tragedy,* Harry Levin's *The Question of Hamlet,* and Marius Bewley's *The Eccentric Design: Form in the Classic American Novel* were carefully prepared, professionally written, and perceptive critical studies. Harold Rosenberg's *The Tradition of the New* and Kenneth Rexroth's *Bird in the Bush: Obvious Essays* were more individual, if less disciplined, volumes of criticism.

Poetry remained on a rather high level of quality, as in *Life Studies* by Robert Lowell, *O To Be a Dragon* by Marianne Moore, and *Summer Knowledge: New and Selected Poems, 1938–1958* by Delmore Schwartz. Hayden Carruth's *The Crow and the Heart: 1946–1959,* Hyman Sobiloff's *In the Deepest Aquarium: Poems,* Louis Coxe's *The Wilderness, and Other Poems,* Hyman Plutzik's *Apples from Shinar,* and Howard Nemerov's *Mirrors and Windows: Poems* were arrestingly imaginative and intelligent in their imagery.

The tone of *The New Yorker* was to be found in many of the volumes of short stories published, especially in John Updike's *The Same Door: Short Stories* and Philip Roth's *Goodbye, Columbus, and Five Short Stories. The Best American Short Stories, 1959* was the best of these compilations in years. Ten of the 14 pieces in *Best Short Stories from the Paris Review* were by Americans, including Philip Roth, Mac Hyman, and Jack Kerouac—an interesting miscellany.

The year was especially rich in biography. Samuel Eliot Morrison presented an authoritative portrait in *John Paul Jones: A Sailor's Biography.* Margaret Leech's *In the Days of McKinley* was characterized by one critic as a "first-rate study of a second-rate president." Popular biography was served by Frances Winwar's *The Haunted Palace: A Life of Edgar Allan Poe* and by Matthew Josephson's *Edison: A Biography.* In the genre of literary biography were Van Wyck Brooks' excellent *Howells: His Life and World,* Richard B. Hovey's scholarly *John Jay Chapman: An American Mind,* Kermit Vanderbilt's carefully detailed *Charles Eliot Norton: Apostle of Culture in a Democracy,* and John Malcolm Brinnin's gossipy *The Third Rose: Gertrude Stein and Her World.*



ALLAN GRANT IN LIFE © 1959 TIME, INC.

One phase of the American literary scene in 1959 was the "beatnik" predilection for combining poetry with jazz. Here Louis Lipton, author of *The Holy Barbarians,* reads to a group in the "beatnik" stronghold of Venice, Calif.

There were two major works of history: Allan Nevins' *The Improvised War, 1861–1862* (volume 1 of *The War for the Union*) and Arthur Schlesinger Jr.'s *The Coming of the New Deal* (volume 2 of *The Age of Roosevelt*). *The House of Intellect* by Jacques Barzun, with its crisp indictment of the shortcomings of American culture, was more analytical and witty than Thomas Griffith's *The Waist-High Culture,* a study with a similar theme.

The Novel.—Critics treated William Faulkner's *The Mansion* with respect, but voiced disappointment that it did not measure up to *The Hamlet,* the first and finest volume of the Snopes trilogy. Anthony West, writing in *The New Yorker* (Dec. 5, 1959), found that parts of *The Mansion* "come uncorrupted from the intense absorption in Faulkner's knowledge and experience of his own place and time, which is his enduring strength; the rest of it was thinly written by a lesser figure. . . ." Malcolm Cowley (*The New York Times Book Review,* Nov. 15, 1959) notes that "in its completed form the Snopes trilogy reveals both the marvelous qualities and limitations of Faulkner as an epic poet in prose."

In *The Cave,* Robert Penn Warren examines human relationships and the crises on which lives turn. Using the tragedy of Jasper Harrick (who is caught in a cave and dies) as the loom on which the skillful texture of the novel is woven, the author has turned out a book which Arthur Mizener characterized as Warren "at his best."

Books by lesser novelists included Saul Bellow's *Henderson the Rain King,* which, while exuberant and filled with excitement, received mixed critical notices. Pearl Buck's *Command the Morning,* although not of the quality of some of her earlier work, deals with a significant issue—the moral problems implicit in man's conquest of the atom. Herbert Gold's witty *The Optimist,* written in clean-cut prose, did not quite succeed in its portrayal of a man who pays the price of ambition. Fear and courage in wartime is the theme of John Hersey's best-selling *The War Lover. The Sensualists* by Ben Hecht failed to command attention in its account of abnormal love and infidelity. At times tense and absorbing, James

Jones' *The Pistol* lacked the richness of Jones' earlier *From Here to Eternity* (1951).

Shirley Jackson's *The Haunting of Hill House* delighted her special audience with its chilling account of a psychic experiment in a haunted house. Bernard Wolfe's gripping *The Great Prince Died* effectively dramatized the assassination of Léon Trotsky and was a welcome addition to the genre of the political novel. Another political novel was Allen Drury's excellent *Advise and Consent,* dealing with the appointment and senatorial approval of a secretary of state.

In the words of Robert Gorham Davis (*The New York Times Book Review,* May 24, 1959), Paul Goodman's *The Empire City* "is a witty, exasperating, thoughtful, fantastic hymn to New York City and to the destructiveness of modern life." Peter S. Feibleman's second novel, *The Daughters of Necessity,* is an account of five women in the life of a wealthy, influential Southerner. *The Daughters of Necessity,* though equally intense, is more mannered than Feibleman's earlier *A Place Without Twilight* (1958). In *Maggie Cassidy,* Jack Kerouac, the acknowledged leader of the "beat generation," turned out a simple tale of adolescent love. *Krishna Fluting* by John Berry, winner of the Macmillan Fiction Contest, takes place in India and deals with the conflicts of its chief character, Peter, who is half Hindu, half Pennsylvania Quaker. Elizabeth Janeway's *The Third Choice* is skillfully rendered "women's fiction"—the story of an active woman who is confined to her bed by an accident, and of her niece and her doctor.

In *The Light Infantry Ball,* as in *The View from Pompey's Head* (1954), Hamilton Basso takes his readers to the Southern town of Old Pompey. This time, using the Civil War as his background, he tells how the "Shinto tradition [reverence for imperial ancestors] of the American South" came into being. *The Tents of Wickedness* by Peter DeVries, although filled with typical DeVries humor (parodies of contemporary writers, outrageous puns, suburban adultery made absurd), is less readable than previous novels by this usually delightful satirist. In *Pursuit of the Prodigal,* Louis Auchincloss added another portrait to his gallery of upper-class figures struggling to maintain their integrity.

Neophyte novelists were ably represented by John Updike, whose *Poorhouse Fair* was a richly energetic and brilliant work of art. James Purdy's impressive *Malcolm* tells of a 14-year-old boy's education in worldliness, and of his corruption. Helga Sandburg's *Measure My Love,* against a rural background, relates the conflict between the realities and the idealistic romanticism of married life. Novels of substance to make the best-seller lists were Meyer Levin's *Eva* (a Jewish girl's survival in a German concentration camp and her relocation in Palestine) and Gerald Green's *The Lotus Eaters* (a satire on people and places in a resort not unlike Miami Beach).

The Short Story.—Young writers published volumes of excellent short stories during 1959. Philip Roth's *Goodbye, Columbus, and Five Short Stories,* which won a Houghton Mifflin Literary Fellowship Award, deals with the dilemma of the Jew in modern American society. *Blackberry Wilderness,* eleven carefully wrought stories by Sylvia Berkman, is, in the words of William Peden, "an admirable and impressive book" about "unhappy intellectuals who have been damaged by the tensions of day-to-day living." (*The New York Times Book Review,* Feb. 15, 1959.) In addition to being a talented novelist, John Updike is an extraordinarily effective short story writer, as witness *The Same Door: Short Stories,* which is marked by economy of prose. *The Best American Short Stories, 1959,* edited by Martha Foley and David Burnett, is a collection of distinction, containing work by such fine young writers as John Berry, Howard Nemerov, John Cheever, Bernard Malamud, John Updike, Robert M. Coates, and Philip Roth. Substantial stories were also to be found in Elizabeth Enright's *The Riddle and the Fly, and Other Stories* and in *Best Short Stories from the Paris Review.*

Poetry.—Several young poets strengthened their reputations in 1959. Hayden Carruth's *The Crow and the Heart: 1946–1959,* inspired by a variety of experiences, is, for the most part, a professionally written volume. Ramon Guthrie's *Graffite* is characterized by the poet's vivid, arresting, and seriously ironic imagination. An unusual series of mocking images is to be found in the title poem of Reed Whittemore's *The Self-Made Man, and Other Poems.*

Among the year's distinguished volumes by major poets was Robert Lowell's outstanding *Life Studies,* which deals with the heartbreak and frightening implications of contemporary life. In addition to the poetry, *Life Studies* contains an autobiographical fragment entitled *91 Revere Street.* In this and several lyric poems, Lowell is remarkably candid about himself and his Jamesian forebears.

Marianne Moore's slim volume, *O To Be a Dragon,* conveyed its author's fine imagination through precise, jewel-like images. *Summer Knowledge: New and Selected Poems, 1938–1958* established Delmore Schwartz in the front rank of contemporary poets; especially notable was Schwartz' *Kingdom of Poetry.* Langston Hughes' *Selected Poems,* while containing the power and beat of Negro speech and music, lacked the discipline necessary for full artistic expression.

Hyman Plutzik's *Apples from Shinar* was electrically alive, particularly in the long poem *The Shepherd.* Hyman Sobiloff's *In the Deepest Aquarium: Poems,* with an introduction by Allen Tate, contained unusual symbolic rhythms that often echoed an intimacy with nature. Louis Simpson's *Dream of Governors* was distinguished by a long narrative poem, *Runner,* about an American soldier who was a messenger during the Battle of the Bulge in World War II, and by shorter poems which gave a comprehensive sense of American life.

Short-story writer Howard Nemerov displayed strange daring and individual diction in *Mirrors and Windows: Poems. Coming of Age: New and Selected Poems* was the reliable work of critic Babette Deutsch. Louis O. Coxe's *The Wilderness, and Other Poems,* intellectually and morally strict, was inspired by the North Woods. Jack Kerouac's *Mexico City Blues,* containing 242 jazz poems, was a beatnik's statement on Zen, drug addiction, and childhood.

Literary History and Criticism.—A middle-aged beatnik poet, Kenneth Rexroth, published 18 impressionistic essays on literature, art, and cultural movements, in a volume entitled *Bird in the Bush: Obvious Essays.* Probably the year's most skillful criticism was to be found in R. W. B. Lewis' *The Picaresque Saint: Representative Figures in Contemporary Fiction.* However, Harry Levin's *The Question of Hamlet* was more profound, giving a new interpretation that focuses on the poetry and the drama of the play, rather than on the character. Marius Bewley's *The Eccentric Design: Form in the Classic American Novel* was an original analytical demonstration of the unique qualities constituting the essential "Americanness" of Cooper, Hawthorne, Melville, James, and Fitz-

gerald. Harold Rosenberg's *The Tradition of the New* comprised highly intelligent essays on painting, history, poetry, sociology, drama, politics, and the novel. An example of disciplined, old-fashioned scholarly criticism of high distinction was Richard B. Sewall's *The Vision of Tragedy,* which treated of the recurring elements of tragedy, from Oedipus and Job to *The Scarlet Letter, Moby Dick,* and *Absalom, Absalom.*

Nearly 600 letters were included in the three-volume *The Letters of Theodore Dreiser,* edited by Robert H. Elias. The letters, although leaving an unpleasant taste of arrogance, reveal Dreiser as a man of enormous energy. Edited by Charles Neider, *The Autobiography of Mark Twain* included nearly 40,000 words of previously unpublished material—further testimony to Twain's position as a major American literary figure. Volume one of *The Papers of Benjamin Franklin* (Jan. 6, 1706 through Dec. 31, 1734), published by the Yale University Press, marked the beginning of a monumental editorial project. *Howells: His Life and World* by Van Wyck Brooks is "a portrait and an interpretation" which brings to life the literary world of which William Dean Howells was such an important figure.

The American expatriate literary and social world of Gertrude Stein was the subject of John Malcolm Brinnin's *The Third Rose: Gertrude Stein and Her World*—equal parts biography and literary criticism. Eleanor Ruggles, in *The West-Going Heart: A Life of Vachel Lindsay,* evoked the world of the poets of the Middle West and the time when Chicago was a literary center. Kermit Vanderbilt's *Charles Eliot Norton: Apostle of Culture in a Democracy* was a carefully documented biography, which showed the influence of the genteel Boston literary circle on American letters. Richard B. Hovey, in *John Jay Chapman: An American Mind,* convincingly pleaded for recognition of his subject's literary stature.

Contemporary literary history was represented by *Advertisements for Myself,* in which Norman Mailer supplies fragments of novels, a fascinating essay on hipsters, and a frenzied appraisal of himself as an important writer. Despite Mailer's almost hysterical insistence, critics were prepared to assess him as a potential major literary figure. May Sarton's *I Knew a Phoenix: Sketches for an Autobiography* was a gentle and civilized account of the people, places, and events that shaped her personal life and her career as a poet and novelist. Sylvia Beach, in *Shakespeare and Company,* brings to life the literary figures (especially James Joyce) that frequented her American bookshop in Paris in the 1920's.

History and Biography.—*The Coming of the New Deal* by Arthur Schlesinger Jr. is the second volume of a major work in American historical literature—*The Age of Roosevelt.* In *The Coming of the New Deal,* Schlesinger examines the reaction of the American people to the dynamism of the New Deal, and the artistry of Roosevelt in shaping government and politics to serve his ends. Allan Nevins' *The Improvised War, 1861–1862* is the first volume of the projected four-volume *War for the Union,* and the fifth volume in the monumental series entitled *Ordeal of the Union.* In *Out of Our Past: The Forces That Shaped Modern America,* Carl N. Degler pursues such themes as the economic ideas of the Puritans, the changing status of the farmer, and the meaning of the American Industrial Revolution.

First-rate biography in 1959 was represented by Margaret Leech's *In the Days of McKinley,* an admirably detailed account of a good but sometimes dull man, and by Samuel Eliot Morrison's *John Paul Jones: A Sailor's Biography,* which, though excellent, was deficient in assessing the significance of Jones' career. Some biographies attempted to rectify previously held partisan estimates of their subjects. *Jefferson Davis: Confederate President,* volume two in a series by Hudson Strode, does some injustice to J. P. Benjamin, Davis' cabinet member, and to General Beauregard in its effort to establish a high place for the Confederate president. Fawn M. Brodie's *Thaddeus Stevens: Scourge of the South* demonstrates the special nature of Stevens' economic radicalism. Gerald M. Capers' *Stephen Douglas: Defender of the Union,* edited by Oscar Handlin, was warmly sympathetic toward Douglas' efforts to prevent the war between the North and the South.

Competent studies included W. A. Swanberg's *Jim Fisk: The Career of an Improbable Rascal,* Alexander Balinsky's *Albert Gallatin: Fiscal Theories and Policies,* Owen Aldridge's *Man of Reason: The Life of Thomas Paine,* John C. Miller's *Alexander Hamilton: Portrait in Paradox,* and Kenneth P. Williams' *Lincoln Finds a General: A Military Study of the Civil War* (volume 5, *Prelude to Chattanooga*). More vivid were Matthew Josephson's *Edison: A Biography,* written from previously unpublished material and documenting the uniquely American character of the self-made inventor, and Arthur Mann's *La Guardia: A Fighter Against His Time* (volume 1), a coolly related narrative of perhaps the most colorful politician of this century.

Miscellaneous Prose.—The "beat generation" was thoroughly treated in Lawrence Lipton's *The Holy Barbarians,* which included a glossary of "beat" terms. Thomas Griffith's *The Waist-High Culture,* written in standard journalistic prose, emphasized the shallowness of cultural values in America. A more devastating critique of American culture came, however, from the witty, civilized pen of Jacques Barzun, who, in *The House of Intellect,* unerringly detected the weaknesses in the American way of thinking, dealing with such things as pedantry and nonintellectualism in the schools, the vulgarity and sloppiness of book and magazine publishing, and the timidity and conformity in philanthropic foundation projects.

James Thurber's *The Years with Ross* was a delightful account of Harold Ross, the founder and long-time editor of *The New Yorker.* Phyllis McGinley collected a number of her kind and wise observations about life in *The Province of the Heart.* Leo Rosten's *The Return of H*Y*M*A*N* K*A*P*L*A*N* nostalgically reminded us of his earlier work. Moss Hart's best-selling *Act One*—poignant and funny, grim and exciting—was one of the finest books on "show business" in recent years. Joseph Wood Krutch, a civilized humanist, provided an indictment of modern mass society in *Human Nature and the Human Condition.* The lasting effects of the Reconstruction in the South were revealed in Hodding Carter's *The Angry Scar.* Richard Rovere brought understanding and a detached prose style to the case of Sen. Joseph McCarthy (*Senator Joe McCarthy*)—his rapid rise and even swifter fall, and the significance of McCarthyism. In *The Sociological Imagination,* C. Wright Mills deplored both the loss of moral values and the consciousness of history among social thinkers. John Kieran concluded a long labor of love in his beautifully written *The Natural History of New York City.*

ANDERSON, Maxwell (70), American playwright: b. Atlantic, Pa., Dec. 15, 1888; d. Stamford, Conn., Feb. 28, 1959. According to Joseph Wood Krutch, Maxwell Anderson, winner of a Pulitzer Prize (for *Both Your Houses,* 1933) and two awards from the New York Drama Critics Circle (for *Winterset,* 1935, and *High Tor,* 1937), "is to be ranked among the five or six most considerable [American] playwrights of the two decades following 1925."

Despite this preferred position in the galaxy of contemporary dramatists, he did not always fare well at the hands of the critics. If some of his efforts were praised for their "simple compassion," "poetic splendor," and "great clarity," others were criticized for their banality, sentimentality, and pretentiousness. George Jean Nathan, in assessing Anderson's talent, offers an explanation for the uneven quality of his plays: "No man writing for our theatre has greater sincerity than Anderson, and no man a higher goal. But none, also, has a mind more critically incapable of meeting the demands it imposes upon itself."

The son of a Baptist minister, Anderson spent his youth in Pennsylvania, Ohio, Iowa, and North Dakota. He was graduated from the University of North Dakota (B.A., 1911) and Stanford University (M.A., 1914). In 1918, after serving as a college instructor of English and as a journalist on several Western newspapers, he went to New York, where he joined the editorial staff of the *New Republic.* He later worked on the New York *Evening Globe* and the New York *Morning World.* His first drama, *The White Desert* (1923), written, as were many of his subsequent plays, in blank verse, was not a success. But his second venture, *What Price Glory?,* which he coauthored with Laurence Stallings, was one of the outstanding hits of the 1924–25 theater season. In 1925 he quit his newspaper post to devote himself entirely to playwriting.

With *Elizabeth the Queen,* produced in 1930, Anderson achieved his first real success as a writer of poetic tragedies. Finding verse a congenial medium of expression, he used this form for many of his most popular works, including *Night Over Taos* (1932), *Mary of Scotland* (1933), *Valley Forge* (1934), *Winterset* (1935), *Key Largo* (1939), and *The Eve of St. Mark* (1942). *Winterset,* usually regarded as his most important play, found its basis in the Sacco-Vanzetti case, the controversial American *cause célèbre* of the 1920's.

In 1938 Anderson joined Robert Sherwood, Elmer Rice, S. N. Behrman, and Sidney Howard in founding The Playwrights' Company, which produced the majority of his later plays. Among them were *Candle in the Wind* (1941), *Joan of Lorraine* (1946), *Anne of the Thousand Days* (1948), and *The Bad Seed* (1954). He also wrote the book and lyrics for *Knickerbocker Holiday* (1938) and *Lost in the Stars* (1949), for which Kurt Weill (1900–50) composed the scores. (The ever-popular *September Song* was written for the first of these musicals.) Anderson's last-produced Broadway play before his death, *The Day the Money Stopped,* written with Brendan Gill and presented in 1958, ran for only four performances. An off-Broadway production of *The Golden Six,* also in 1958, was somewhat more successful.

ANDERSON, Robert Bernerd, U.S. secretary of the treasury: b. Burleson, Texas, June 4, 1910. Secretary Anderson has directed the administration's battle to balance the budget and control inflation in its domestic economy. In the fall of 1959 he addressed himself to the problem of a growing deficit in the country's foreign trade balance by initiating major changes in its foreign economic policy.

A graduate of the University of Texas Law School (1932), Anderson served in the state legislature for two years and held state administrative posts for another two years. He became general counsel at 31, and general manager at 41, of a $300 million cattle, wheat, and oil empire. In 1952 Anderson became a Texas Democrat-for-Eisenhower (later registering as a Republican), and in 1953 Eisenhower appointed him secretary of the navy. In May 1954 he was moved up to be deputy secretary of defense. He resigned in 1955 to return to private business but was brought back to the government in the Treasury post on July 29, 1957.

Widely respected even by critics of his policies, Anderson was in 1959 considered the most powerful figure—often called the "strong man"—of the cabinet. He is convinced that a sound dollar is important not only to the country itself but to the economic health of the entire free world. In view of the estimated deficit of more than $4 billion in 1959 in the United States balance of payments picture, Anderson urged at the September meeting of the World Bank and International Monetary Fund that the now prospering countries of western Europe, as well as Great Britain and Japan, remove controls on imports of American goods and on dollar payments, and that they take a larger share of the burden of aid to underdeveloped countries.

In October he proposed that countries receiving U.S. Development Loan Fund assistance be required to spend the money on American goods and services. Emphasizing that the United States did not intend to shirk any part of its own responsibility in these areas, he called for "a reorientation of the policies of the earlier postwar period" with the aim of making aid to underdeveloped countries a cooperative free-world undertaking.

ANDORRA. An autonomous state on the south slope of the eastern Pyrenees, under the joint sovereignty of the president of France and the Spanish bishop of Urgel. Area, 175 square miles; pop. (est. 1956), 6,000. Andorra la Vieja (1,100) is the capital. Andorrans speak Catalan and are of the Roman Catholic faith. The government consists of a 24-member General Council of the Valleys elected for a 4-year term by the heads of families; and a syndic, chosen by the council as its executive. French and Spanish currency are in use, and France represents Andorra in foreign affairs. Primary schools number 25 (1954), with 875 pupils. Agriculture and sheep raising are the chief occupations, with tourism and smuggling as important supplementary sources of income. A good highway traverses Andorra from the French to the Spanish border. Radio Andorra is one of the most powerful stations in Europe.

ANTARCTICA. Confined almost entirely within the Antarctic Circle, the frigid continent's 5,100,000 square miles are isolated from the earth's inhabited continents by the Atlantic, Pacific, and

Indian oceans. Antarctica has an average elevation of about 5,000 feet above sea level, and is covered mainly by a sheet of ice whose average thickness was estimated during the International Geophysical Year (IGY), at about 8,000 feet, thus suggesting that the continent consists of several islands submerged under heavy ice. At one point in Marie Byrd Land an ice-filled strait between such submerged islands was found to be 14,000 feet thick where the surface of the ice sheet was about 5,000 feet above sea level.

The geographical South Pole, at an elevation of 9,200 feet, was first reached on Dec. 14, 1911, by the Norwegian Roald Amundsen with four companions. A month later, Robert Scott's party of five men also reached the pole, but all of them perished on the return journey. The Norwegian Carsten Egeberg Borchgrevink was the first to set foot upon and also to spend a winter on the continent (1895), and Sir Hubert Wilkins was the first to explore it by airplane (1928). The first two women to spend a year wintering in the Antarctic were members of the Ronne Expedition of 1946–48.

On the conclusion of the IGY on Dec. 31, 1958, a Special Committee on Antarctic Research (SCAR) was established to continue scientific programs on the continent. During 1959 the 12 member nations of SCAR—Argentina, Australia, Belgium, Chile, France, Great Britain, Japan, New Zealand, Norway, South Africa, the USSR, and the United States—continued to maintain 41 stations in the area. Direction of future United States activities was undertaken by the National Science Foundation, headed by Dr. Alan T. Waterman, with Albert P. Crary (whose appointment was announced on March 28) in charge of scientific operations.

In the 1958–59 summer season, 6 men under Crary made a three-month traverse in Sno-Cats from Little America Station (Little America V) to continue the previous summer's seismic soundings across the Ross Ice Shelf. Skeleton Inlet and glaciers leading up to the Victoria Land plateau were covered by soundings and the study of ice movements. A traverse party from Byrd Station went south into the Horlick Mountains and carried out seismic soundings at intervals of about 35 miles with gravimetric, magnetic, and altimetric measurements.

Later in the season another party from Byrd Station accurately charted new peaks and others in the Executive Committee Range that had been sighted by the Navy in 1947. The highest peak in the range was found to be 13,856 feet high. In addition, an airborne traverse team of 3 men from Little America followed a path at right angles to a hypothetical trough in the ocean floor, the axis of which averaged about 3,200 feet below sea level. (The trough had been found originally by the Ellsworth Station traverse in 1957–58.) Seven plane landings were made on the 130th meridian of west longitude in Marie Byrd Land, along a 550-stretch where the ice was found to be grounded at all seven points between the mountain ranges at either end of the line. Although there appeared to be virtually no possibility of water interchange between the Weddell and Ross seas, mounting evidence leaned toward the Antarctic continent's being divided by a down-warped, ice-filled depression connecting them. Additional data was still needed, however, especially on the area to the east.

During the winter of 1959, 18 men remained at South Pole (Amundsen-Scott) Station, 22 at Byrd Station, and 130 men at the McMurdo Naval Air Facility, the logistic base for the support of the inland stations. Little America Station was abandoned. Hallett Station in Victoria Land was operated jointly for the United States and New Zealand by 15 men, while Ellsworth Station on the

WIDE WORLD

The U.S. Navy icebreaker *Glacier (rear)* comes to the aid of the Belgian expedition ship *Polar Hav*, which was trapped for seven weeks in the Antarctic before release in April.

Weddell Sea coast in Edith Ronne Land was transferred to Argentina on February 2. There, 28 Argentinians and 1 American pursued a limited scientific program. A limited program was also maintained at Wilkes Station on Budd Coast, which was turned over to the Australians on February 4.

On April 14, 1959, Rear Adm. David M. Tyree succeeded Rear Adm. George J. Dufek as commander of the Navy's support forces. The 1959–60 program, known as Operation Deep Freeze Sixty, was under his direction.

The Argentinians continued in 1958–59 to maintain their six permanent bases on Palmer Peninsula and General Belgrano Station on the Filchner Ice Shelf. The last named was replenished by the icebreaker *General San Martín* when it took Argentine personnel to man Ellsworth Station. Because the United States icebreaker *Edisto* was beset for a long time in the pack ice close to Cape Norvegia, 22 of the Americans who had manned Ellsworth were evacuated by the Argentinians. Eventually freed, the *Edisto* reached Ellsworth and brought out the remaining 11 Americans after making the official transfer of the station to Argentina. On its return trip, the ship was again beset, and the U.S.S. *Glacier*, which had intended to attempt a penetration of the Bellingshausen Sea, was sent to her rescue. Meanwhile, the *General San Martín* proceeded to the Argentine

Aboard his flagship, the icebreaker *Glacier*, in New York on April 14, Rear Adm. George J. Dufek (right) presents stuffed penguin to Rear Adm. David M. Tyree, who succeeded him as commander of U.S. Naval Support Forces, Antarctica.

THE NEW YORK TIMES

base of the same name in Marguerite Bay on the Palmer Peninsula, which was destroyed by fire. The personnel were evacuated by helicopter, and the base was abandoned. The Argentine bases, as well as the four Chilean bases on the Palmer Peninsula and the South Shetland Islands, were engaged mainly in weather observations and local surveys, as were the seven British bases in the same sector, where all three nations have made overlapping territorial claims. In addition, the British maintained Halley Bay Station on the east shore of the Weddell Sea in Queen Maud Land.

King Baudouin Station, the Belgian base on Princess Ragnhild Coast in Queen Maud Land, had been established early in 1958 by Baron Gaston de Gerlache, son of Adrien de Gerlache, who led the expedition to Bellingshausen Sea in the *Belgica* in 1897–99. The wintering party collected valuable scientific information and made a geological and surface survey of the interior to the south, thus obtaining ground control points for aerial photographs of the area. En route to resupply the base in 1958–59, the *Polar Hav* was beset for seven weeks but was able to carry out its mission with the assistance of the *Glacier*.

The Russians extended their post-IGY activities by establishing a new station at the Pole of Relative Inaccessibility and another, called Lazarev Station, on the coast of Queen Maud Land on March 10, 1959. Their Oazis Station was scheduled to be turned over to Poland to pursue a scientific program in cooperation with the Russians. On September 16, a Soviet transcontinental party left Mirny Station on the Queen Mary Coast for Vostok Station, its first objective, reached on November 29. Designed for seismic and glacier studies, the trip was to end at Lazarev Station. After the Russians reached the South Pole on December 26, it was announced that they would return to Mirny without crossing the continent.

In 1958–59 the Australians continued to maintain their bases in their claimed sector south of the Indian Ocean. Investigations in various branches of science were carried out together with local surveys and aerial photography. On Feb. 21, 1959, the Australians made the first recorded landing on Oates Coast, at the extreme eastern edge of their Antarctic claim. The New Zealanders continued to maintain Scott Station on the Ross Sea, and on October 17, a 9-man international team that included 6 Americans left from there for a four-month traverse of Victoria Land.

The Norwegians terminated their activities at Norway Station in Queen Maud Land, which they had operated as part of the IGY since 1956. Since this station formed an important link in the chain of stations contributing to the overall picture of Antarctic weather, it was agreed that a 10-man party of South Africans under Hannes La Grange would operate it on the conclusion of the 1959–60 season.

The Japanese Showa Station on Lützow-Holm Bay, also in Queen Maud Land, was to function for another year with a program that included dog-team parties to conduct surface surveys. Scientists led by Dr. Tatsuo Tatsumi were to replace the 1958–59 group when the expedition ship *Soya* reached the station in January 1960.

A Conference on Antarctica, attended by delegates of the 12 members of SCAR, opened in Washington on Oct. 15, 1959. The delegates drew up a treaty, signed on December 1, which (1) prohibits the use of Antarctica for warlike purposes; (2) permits free scientific use of the continent; (3) freezes existing territorial claims there; (4) promotes international cooperation for scientific purposes; and (5) sets up an inspection system to make sure that its provisions are not violated. Article 5 bans nuclear explosions and the disposal of atomic wastes in Antarctica. The 12 governments concerned must give final approval to the treaty before it enters into force. Two months thereafter a consultative committee is scheduled to meet in Canberra, Australia.

Captain, U.S. Naval Reserve; Antarctic Explorer.

ANTHROPOLOGY. During 1959 several important trends which had been developing throughout the preceding ten years became increasingly evident. To mark the end of the decade, it will be of value to summarize the more outstanding tendencies that have manifested themselves. They include:

(1) In physical anthropology, an increasing concern with the relation of man's physical evolution to his capacity for culture, and with the implicated physiological, biochemical, genetic, and growth processes—in contrast to the earlier preoccupation with comparative human anatomy.

(2) In ethnology, the formalization of ethnographic analysis in terms of systematic models which have proved useful in other disciplines, including communications theory, descriptive linguistics, symbolic logic, and various branches of mathematics.

(3) The resurgence of interest in the history and processes of cultural evolution, based on a fusion of recent archaeological and social-anthropological typologies with improved methods of dating and with a more sophisticated understanding of the mechanisms of cultural stability, of cumulative technological change, and of revolutionary social reorganizations in response to stress.

(4) In applied anthropology, the increasing employment of anthropologists as researchers and consultants in psychiatry, public health, hospital administration, and technological aid and social development programs (in "contemporary" rather than "primitive" societies).

(5) The beginning of a shift in emphasis in the cultural anthropologist's use of psychological concepts, from affective (particularly Freudian) to cognitive theory.

(6) And, overall, a marked increase in precision of methodological procedures, in the direction of instrumentation and quantification (or, where this is inappropriate, of logical formalism).

These developments presage a new anthropology which, in the course of the next generation, will differ markedly from the anthropology of the past generation. This new anthropology will compete in rigor of conceptualization and method with more precise behavioral disciplines such as descriptive linguistics. It will accomplish a much higher degree of internal organization than at present obtains among its component major specialties of physical anthropology, archaeology, and cultural anthropology.

The geographical scope of ethnographic description may shrink or expand, depending on the course of the cold war. For political reasons, large parts of the world are forbidden or hazardous regions for the traditional small informal anthropological field party. The Soviet Union and the United States do not send ethnological field teams into each other's territory or into the territories of their respective allies. Mainland China has become almost an ethnological terra incognita to Americans, and they are not welcome in some parts of Southeast Asia and Africa.

As the erstwhile primitive populations of the earth become more nationalistic and more developed technologically, the traditional devotion of the anthropologist to primitiveness as a social type will be replaced by a concern with peasant communities and with such developmental processes as technological evolution, political and ideological reorganization, trends in cultural conservatism, and changes in man's relation to his physical environment.

International Cooperation.—Anthropological traditions vary from country to country in the definition of the term "anthropology," in the emphasis given to particular methods and theories, and (sometimes) even in the definition of what constitutes a scientific problem. In order to facilitate international communication of concepts and data, and to overcome some of the restrictions on investigation noted above, the Wenner-Gren Foundation for Anthropological Research has supported the launching of a new journal, *Current Anthropology*. Planned as a fully international journal, it will publish (in English) review articles, brief reports, and correspondence from scholars in every interested country in the world, including the Soviet Union. The organizing editor during 1959 was Sol Tax (University of Chicago). The new emphasis on international collaboration in anthropology was indicated also by the holding of the annual meeting of the American Anthropological Association in Mexico City in December 1959.

The *Oreopithecus* Discoveries.—One of the most significant discoveries of recent years in the field of human evolution is currently being reported from Italy, where extensive new finds of the small fossil hominid *Oreopithecus* are being uncovered from lignite deposits. Although the bones had not at the date of writing been fully analyzed and described in scientific publications, a preliminary report to the American Anthropological Association by William L. Strauss (Johns Hopkins) has indicated that these extremely ancient anthropoids, which existed during the lower Pliocene period, several million years ago, were similar in certain anatomical features to later protohominids and even to modern man. These similarities suggest the possibility that the line of human ancestry diverged from that of the monkeys and the great apes much farther in the past than had been commonly suspected. (See illustration at right.)

The Darwin Centennial.—One hundred years ago, in 1859, Charles Darwin published *The Origin of Species*. The principal theory of organic evolution expounded in this work—that natural selection, acting on inheritable variations, yielded cumulative change in taxonomic characteristics of plants and animals—was of fundamental importance in giving early anthropology a coherent rationale. Anthropology as a discipline, distinct from the informal collection of travelers' tales about primitive peoples and of speculations about the provenience of old bones and stone tools, was founded on the theory of evolution put forward by Darwin and Alfred Russel Wallace. Although later research has modified many of the applications of this theory to anthropological data, the stamp of Darwin's and Wallace's thinking still lies on the modern science.

To mark the centennial, anthropologists have contributed to several symposia, including "The Evolution of Man's Capacity for Culture," published in *Human Biology; Evolution and Anthropology: A Centennial Appraisal*, published by the Anthropological Society of Washington; and the University of Chicago's five-day convocation of scientists from Europe and America, beginning on November 24. Loren C. Eiseley (University of Pennsylvania) had previously published *Darwin's Century* (1958), a study of the cultural sources of Darwin's theory. (See also GENETICS.)

Support of Anthropological Research.—The National Science Foundation has advanced its program for the support of the social sciences by establishing an Office of Social Sciences, with an anthropologist, Fred Eggan (University of Chicago), among the members of its advisory committee. This action indicates a continuation of National Science Foundation support for anthropological field research, with additional recognition for the purely social and cultural aspects of anthropological investigation. Grants to anthropologists in support of basic research during 1959 amounted to several hundred thousand dollars, exclusive of a number of travel grants and of pre- and postdoctoral training fellowships.

Federal sponsorship of basic anthropological research is also contributed by the U.S. Public Health Service, particularly through the National Institute of Mental Health. Federal funds for various special research projects were provided by the defense agencies, by the National Academy of Sciences–National Research Council, and by the State Department under the Fulbright Act.

J. HURZELER; WENNER-GREN FOUNDATION

Discovery of these fossil remains of the hominid *Oreopithecus* in Italy, 100 miles north of Rome, stirred anthropologists in 1959. The find indicates a much earlier beginning for the line of human ancestry than had been believed.

A considerable proportion of research funds in anthropology is now supplied by the government, in sharp contrast to the pre-World War II period, when anthropological research was almost exclusively financed by philanthropic foundations, museums, and individual sponsors. This trend parallels the tendency in other sciences for research and training programs alike to become increasingly dependent on governmental monies as national policy increasingly emphasizes the importance of science.

Studies in the Culture of Science.—With the dawn of the atomic age and the space age, and the accompanying revolution in automatic communication, control, and calculation, the world has become aware of the importance of scientific and technological innovations for more widespread social change. Although most anthropologists have observed the new era more as laymen than as scientists, a small beginning is being made in the scientific study of science itself. Anthropologists have been professionally interested in two aspects of this study: the interpersonal aspects of interdisciplinary social science team research, and popular attitudes toward science and scientists.[1]

[1] A widespread distrust and even dislike of science and scientists has been revealed by a study of American high school students published in *Science* (Aug. 30 and Dec. 6, 1957; Feb. 14, 1958) by Margaret Mead (American Museum of Natural History) and Rhoda Métraux.

At least in American anthropology, problems of scientific communication are assuming serious dimensions as published and unpublished information accumulates at a constantly accelerating rate. Attempts to solve these problems by the devices of team research, conferences, symposia, and review papers impose an increasingly heavy burden of scientifically unproductive activity (administration, committee work, and the writing of guest papers) on the most creative members of the profession, and tend thereby to stultify research still further. As in other sciences, various plans are constantly being made for rendering scientific material more readily available by redesign of journals and the addition of technical library and bibliographical aids.

The current popularity of social anthropological studies of psychiatric research institutions, such as *The Psychiatric Hospital as a Small Society* (1958) by William Caudill (Yale University), contributes valuable data to the anthropological study of the culture of science, for the institutions under study are almost always research as well as therapeutic and training establishments, and the studies therefore include analyses of scientific activity itself.

ARAB LEAGUE. A loose association of 10 Arab states, the Arab League includes the United Arab Republic, Iraq, Jordan, Lebanon, Saudi Arabia, Yemen, Sudan, Libya, Morocco, and Tunisia.

The league was founded on March 22, 1945, in Cairo, where it has its headquarters. Each member state has one vote in the Arab League Council, which may meet in any Arab capital. Abd al-Khaliq Hassouna, the former foreign minister of Egypt, has been secretary general of the league since 1952. The organization's purposes include the strengthening of ties among Arab states and peoples, and the coordination of their political, military, and economic programs. A primary consideration has been the protection of the Arabs of Palestine who have become refugees in various states. The league has sponsored economic cooperation among member states through its Economic Council, directed the economic boycott of Israel, attempted to coordinate oil policies by its Oil Committee, and fostered the establishment of an Arab bank and of Arab educational institutions.

The chief development in 1959 was the open quarrel between Gen. Abdul Karim al-Kassem, prime minister of Iraq, and President Gamal Abdel Nasser of the United Arab Republic (UAR). This break has affected all measures and proposals of the league.

At meetings in Cairo on Jan. 5–14, 1959, the league's Economic Council proposed an Arab common market. The project was bitterly assailed by Iraq, but the Arab Trade Exchange Agreement was amended to provide for a preferential lowering of the tariffs on industrial goods (by 35%) and on agricultural products (by 60%). At the same meetings the league decided to establish an Arab navigation company, with subscription of its capital by the governments and nationals of the 10 member states and of Kuwait, Bahrain, and Qatar. Also, an Arab airline was proposed; and more than 75% of the stock of the Arab Financial Institution for Economic Development was subscribed.

On April 2–7, meetings were held in Beirut, Lebanon, chiefly to settle the rift between Iraq and the UAR over the violent outbreaks in Iraq (Iraq, Jordan, and Tunisia were not represented at the meetings). General al-Kassem had accused the UAR of fomenting attempts to overthrow the Iraqi regime, while President Nasser claimed that they were organized by Communists nurtured by the Iraqi government. The league's Political Committee refused to censure Iraq, but member states were urged to resist Communist influences. United Nations Secretary General Dag Hammarskjöld's plan to give the Palestine refugees jobs in Arab countries was rejected at the Beirut meetings.

The 32d session of the Arab League Council was convened in September in Casablanca, Morocco. Nationalists from Algeria were present as observers, but representatives of Iraq and Tunisia did not attend. The league advocated a continuation of the Arab boycott of Israel; supported the UAR's refusal to permit Israeli shipping in the Suez Canal; and advocated independence for Algeria. A motion to consider revision of the league's charter was referred to a future meeting of ambassadors.

At a meeting in Jidda, seaport city of Saudi Arabia, in October, representatives of the Arab League approved proposals for an Arab-owned, 1,250-mile oil pipeline from Kuwaiti and Saudi Arabian fields to the Mediterranean coast. In April an Arab oil conference in Cairo had suggested the building of such a pipeline; financing remained to be arranged.

ARABIA. This peninsula in southwestern Asia (area, 1,180,280 square miles; estimated population, 13 million) is bounded by the Persian Gulf and the Gulf of Oman on the northeast, the Arabian Sea and the Gulf of Aden on the south, the Red Sea on the southwest, the Gulf of 'Aqaba on the west, and Jordan and Iraq on the north. It comprises the independent Kingdom of Saudi Arabia and the Imamate of Yemen; the remaining states, all under some form of British domination, control, or influence, are the Sultanate of Muscat and Oman, the Colony of Aden, Aden Protectorate (including the Federation of the Arab Amirates of the South), Trucial Oman (Trucial States), and the sheikdoms of Bahrain, Kuwait, and Qatar. Yemen, which formed a loose alliance in 1958 with the United Arab Republic under the name of the United Arab States, has attempted to induce other states of Arabia to join this federal union. (For components of Arabia not discussed in this article, see ADEN, MUSCAT AND OMAN, SAUDI ARABIA, and YEMEN.)

Petroleum Resources.—Arabia contributed in 1958 about 14% of the world's production of crude oil. The proven reserves in the area are estimated at about 110 billion barrels, or over 40% of the world's known reserves. The amount of crude petroleum produced by Arabian countries in 1958 totaled 989,265,503 barrels. Of this total, Kuwait produced 510,775,525 barrels; Saudi Arabia, 370,485,754; Qatar, 63,335,889; the Neutral Zone (between Kuwait and Saudi Arabia), 29,795,315; and Bahrain, 14,873,020. Oil royalties awarded Arabian countries in 1958 amounted to about $785 million.

The Arabian American Oil Company (ARAMCO) holds the concession to exploit the oil resources of Saudi Arabia and its offshore regions. Owned by the Standard Oil Company of California, the Texas Company, the Standard Oil Company of New Jersey, and Socony-Vacuum, ARAMCO also possesses the Trans-Arabian Pipeline Co., which transports a considerable portion of its oil across Arabia to the Mediterranean coast in Lebanon. Standard Oil of California and the Texas Company hold the concession for Bahrain, and the British Petroleum Company and the Gulf Oil Corporation operate jointly in Kuwait. The Iraq Petroleum Company (British, American, French, and Anglo-Dutch interests) owns the concessions for Qatar,

Muscat and Oman, Trucial Oman, and Aden Protectorate. In southern Oman, at Dhofar, Cities Service Petroleum Corporation operates a concession. Oil rights in the Neutral Zone are divided between the Paul Getty Oil Company and the American Independent Oil Company.

The usual split of profits between the producing company and the government of the state was 50–50 until the Japanese Petroleum Trading Company entered in 1957 into an agreement for a 56–44 split in favor of the Saudi Arabian government in the offshore regions of the Neutral Zone. Later, the Standard Oil Company of Indiana agreed to a 75–25 split with Iran in regard to offshore areas on that side of the Persian Gulf. These breaks from the customary division of profits has increased the pressure on the older concessionaires to liberalize their payments. (See also MIDDLE EAST; PETROLEUM.)

Bahrain.—This sheikdom consists of several islands in the Persian Gulf near the coast of Saudi Arabia. The capital, Manama (est. pop., 45,000), is located on the largest island (213 square miles), which gives its name to the entire group. The total population is estimated at 130,000.

The main income is derived from oil, which in 1958 provided revenue of about $15,600,000 from a production of 14,873,111 barrels. Two thirds of this sum was handed over to the public treasury, while the remainder was retained by the ruler, Sheik Sir Salman ibn Hamad al-Khalifa (acceded in 1942) for the private use of the ruling family of over 200 members. By treaty, Great Britain conducts Bahrain's foreign relations and guarantees her protection. Residing in Manama is the British political agent for the Bahrain Islands, as well as the British agent for the entire Persian Gulf region. The ruler maintains consultative councils manned by elected representatives, but there is little democratic government. Although the courts and the law codes have been modernized, the judges are all members of the ruling family.

In 1956, Bahrain suffered labor disturbances and strikes which were terminated by exiling several of the leaders to St. Helena. However, in 1957 the ruler issued a series of ordinances which established a labor code providing for trade unions and the settlement of trade disputes. Compared with most Middle Eastern labor legislation, that of Bahrain is remarkable, and credit is largely due to the British labor advisers.

It is estimated that Bahrain's oil resources may be exhausted in 30 years, and thought already is being given to the future when oil royalties stop. A $7 million pier is being constructed at Manama in hopes that Bahrain may retain her position as a major trading center in the Persian Gulf. Large fresh-water springs in the gulf are to be capped and the water piped ashore for much-needed irrigation.

Kuwait.—This desert sheikdom (area, 6,000 square miles; est. pop., 240,000, of which half is native) lies at the head of the Persian Gulf, between Saudi Arabia and Iraq. Kuwait is ruled by Sheik Sir Abdallah al-Salim al-Sabbah (acceded in 1950), who is advised by an 11-man council composed of members of the al-Sabbah family. The army and police are headed by Sheik Abdullah al-Mubarak al-Sabbah, but the protection of the state rests in the hands of the British under a treaty concluded some 60 years ago. The British agent in Kuwait controls the foreign affairs of the state.

The importance of Kuwait depends on the 60 billion barrels of proven oil reserves beneath the desert sands. The Kuwait Oil Company (KOC), jointly owned by the British Petroleum Company and Gulf Oil Corporation, holds the concession for the mainland, and the Japanese-owned Arabian Oil Company has rights for offshore developments in the Neutral Zone. In 1958, KOC developed 38 new wells, and United States firms in the Neutral Zone drilled 47 more wells, making a total of 103 producing wells there. The Japanese are bringing in a drilling platform and have established two camps (one in Kuwait and one in Saudi Arabia) to further oil exploration. The Japanese contract calls for a 57–43 split in favor of Kuwait, which shares in the profits from all operations, including sales to the final consumer. In 1958, Kuwait exported 465 million barrels of crude oil, with the United States taking 15.9%; the United Kingdom, 28.7%, and France, 12.2%. Refinery output was over 43 million barrels, and in 1959 premium gasoline was produced for the first time. In 1958, oil taxes and royalties amounted to $415 million.

Since Kuwait is included within the sterling bloc, KOC earnings and Kuwait's income constitute an important source of hard currency for the British—estimated at 10% of the British earnings of dollars. In spite of the ruler's determined effort to spend, Kuwait's revenues in 1958 far exceeded estimated expenditures of £90–100 million. Economic activity, development, and expansion were in evidence in every field in 1959. One of the chief projects in 1959 was the completion of the first phase in developing the new Port of Kuwait to alleviate congestion and lessen the time ships remain in the harbor. Another smaller harbor is being dredged by the American firm Pomeroy-Hawaiian Dredging Co.

Disorders in Iraq in 1959 had their repercussions in Kuwait, and in February the sheik stopped demonstrations in support of President Nasser and the United Arab Republic. Most of the foreigners in Kuwait are Arabs, 40,000 of whom are Iraqis. Many of the schoolteachers are Egyptian and others are Palestinian in origin. There is a small undercover Communist group which might attempt to seize power should Communists take over in Iraq, but most Arab nationalists in Kuwait rely on British power to protect them from such a move. Because of the wealth of the state, there is little poverty.

Qatar.—This sheikdom, ruled by Sheik Ali ibn Abdullah ibn Qasim al-Thani, comprises a barren peninsula on the Persian Gulf with an area of 8,000 square miles and an estimated population of 35,000. The capital, Doha (pop., 20,000), is the residence of the British political agent, who operates under a treaty which provides for a perpetual truce with Great Britain. The state had little significance until its oil resources were recently developed by a subsidiary of the Iraq Petroleum Company, which held a concession for the mainland, and by the Overseas Exploration Company of the Shell Oil group. The center of the oilfield is at Dukhan, about 60 miles from Doha. On April 16–23, 1959, at a meeting in Cairo of oil experts from seven Arab countries and Kuwait and Qatar, suggestions were presented for the building of a $600 million pipeline from Qatar to Lebanon. At the present time Qatar oil is loaded on tankers at Umm Said, a deep-sea port 19 miles south of Doha. The sheikdom is largely undeveloped, with only 175 miles of roads for vehicles. In 1958 the sheik received over $60 million in taxes and royalties from the oil companies. He purchased a villa at Geneva, Switzerland, in 1959 and indicated that he intended to spend much of his time there.

Trucial Oman or **Trucial States.**—This territory, which extends along the coast of Arabia for about 400 miles from the Qatar Peninsula south to the Sultanate of Muscat and Oman, is named from the treaties or truces concluded in the 19th century with Great Britain. Its seven sheikdoms comprise an area of about 6,000 square miles and contain a total population estimated at about 115,000; they are Abu Dhabi, Dibai (or Dubai), Sharjah and Kalba, Ajman, Umm al-Qaiwain, Ras al-Khaimah, and Fujairah. Dibai is the chief port. The British political agent lives in Sharjah, where a detachment of the Royal Air Force is stationed.

The sheikdoms are hardly more than coastal towns with a desert hinterland on the peninsula jutting out to the Strait of Hormuz and separating the Persian Gulf and the Gulf of Oman. A subsidiary of the Iraq Petroleum Company holds a concession for oil in Abu Dhabi, where a preliminary strike was made in 1954. Offshore rights are held by Abu Dhabi Marine Areas, Ltd., which is controlled by the British Petroleum Company. The British continue to hold the Buraimi Oasis, a disputed territory where six out of eight villages have been assigned to the sheikdom of Abu Dhabi. Connected with this claim is a large area (30,000 square miles) of desert containing perhaps 10,000 inhabitants. Oil resources may exist there, but control over Buraimi was presumably taken in connection with the British subjection of the imam of Oman.

Professor of History,
The Ohio State University.

ARCHAEOLOGY. Highlights of world archaeological research are summarized below in two sections: (1) Western Hemisphere; and (2) Eastern Hemisphere. For related information, see ANTHROPOLOGY and the Index entry, *Archaeology.*

WESTERN HEMISPHERE

The extent of archaeological fieldwork in the Western Hemisphere continued its rapid expansion in 1959. Of the work undertaken during the year, some of the more important long-range programs will be summarized here; readers interested in further detail are referred to the excellent summaries in the "News and Notes" section of the quarterly journal, *American Antiquity,* published for the Society for American Archaeology by the University of Utah Press, Salt Lake City.

United States.—One particularly important development was the creation of the Branch of Archeology in Washington, D.C., as part of the Division of Interpretation of the National Park Service of the Department of Interior. Although the National Park Service throughout its history has shown an interest in archaeology, too often the basic research required to understand the history of the

AMERIND FOUNDATION, DRAGOON, ARIZONA

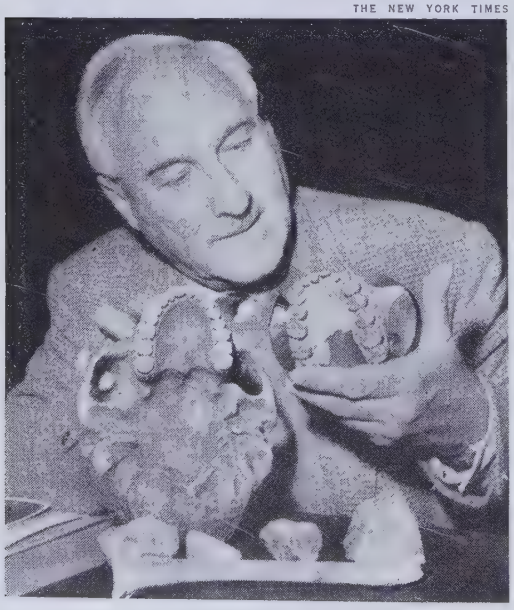
site was forced to be secondary to other interests in the service. Now, with the new branch, the role of archaeology in all areas administered by the National Park Service can be assessed properly at the planning and policymaking stages.

An example of the type of work undertaken by this office is the Wetherill Mesa Project of Mesa Verde National Park, where archaeologists with the assistance of a research grant from the National Geographic Society (q.v.), are excavating and stabilizing sites on top of the mesa. Besides adding immensely to our scientific knowledge of the area, these newly opened areas will take the annual pressure of tens of thousands of tourists out of the narrow canyons and distribute them more evenly throughout the park. The wear and tear on many of these magnificent pueblo structures recently has caused the National Park Service to close many ruins.

An interdisciplinary research program is now under way at the University of Arizona as a result

Dr. Louis S. B. Leakey compares cast of 700,000-year-old skull fragment (right) found in Tanganyika, with that of Peking Man. The African fossil, oldest known evidence of tool-making man, was one of the major discoveries of 1959.

THE NEW YORK TIMES



of financing by the Rockefeller Foundation of a long-term project to study the utilization of arid lands. The research includes geohydrology, geochronology, climatology, biology, and archaeology. The archaeological work will include the study of aboriginal agricultural practices (particularly in the prehistoric Southwest), of changing human adaptations to changing climates in arid regions, and of the long-term effects, both environmental and social, of human occupation of arid areas.

The newest long-term, privately financed research program in the United States has been opened ten miles south of Taos, New Mexico. It is known as the Fort Burgwin Research Center, an affiliate of the Wichita Foundation, Inc. Although it will be dedicated to the development of the scientific and cultural programs of northern New Mexico, its chief work will be with archaeological problems. The center is housed in the reconstructed buildings of old Cantonment Burgwin, a pre-Civil War Army post built in 1852 and abandoned in 1860. To date, the archaeologists have excavated the long-forgotten buildings of the cantonment and conducted a survey of the prehistoric sites of the region. From this data a long-range archaeological research program has been formulated by the center and will be conducted in cooperation with the Museum of New Mexico.

Middle America.—The most outstanding new large-scale archaeological project now under way in the Western Hemisphere is the Joint Casas Grandes Expedition of the Amerind Foundation of Dragoon, Ariz., and the Instituto Nacional de Antropologia e Historia of Mexico. Working at the famous site of Casas Grandes in the Municipio of Casas Grandes in northwestern Chihuahua, Mexico, the Amerind Foundation is responsible for financing and directing the excavations for a three-year period, as well as for the final publication of reports; and the Instituto is in charge of the consolidation and preservation of the ruin as a national monument of Mexico.

To date, only a small portion of the site has been excavated, but sufficient information has been uncovered to demonstrate that this site is not, as once thought, a southern extension of the Anasazi culture (popularly known as the Basket Maker and Pueblo cultures) of the Southwest. Instead, the site shows strong Meso-American influence from the south in such things as temple mounds, plazas and ceremonial structures, ball courts, etc. The site was an important trade center, for in one room alone the excavators found two million *Nassa* shells, 10,000 *Conus* shells, *Strombus* and other varieties, as well as partially complete and finished shell ornaments. Apparently, the inhabitants of Casas Grandes were carrying on an extensive trade in shell and salt with the aboriginal people living around the Gulf of California, and specialists at Casas Grandes were manufacturing jewelry for general sale or trade.

The main section of the ruins covers a rectangle some 700 meters along a north-south axis and 1,300 meters along an east-west axis, or roughly 237 acres. The western half was apparently reserved for ceremonial structures, while the eastern half accommodated the multistoried living structures. A canal three meters wide and one meter deep had been excavated by the inhabitants to bring water three miles from a warm spring to the living area of the site. As work continues over the next two years, excavations will uncover many new and important things and serve to give a better understanding of the Meso-American influences on the Southwest in pre-Spanish times.

All of the large, stone, helmeted heads of the Olmec culture from the La Venta and San Lorenzo

AUTHENTICATED NEWS; HARVARD UNIVERSITY

(*Above*) An eight-foot bronze of Athena, believed to date from the 5th century B.C., was among classical sculptures unearthed on July 18 from a 2,000-year-old warehouse in Piraeus, Greece. (*Right*) Stone Age craftsmen carved this limestone Venus, found in southern France, about 22,000 years ago. The bas-relief was cut in a block nine inches long.

areas in southern Mexico have now been brought out of the jungle to museums in Villahermosa, Tabasco, and Jalapa, Veracruz.

Financed privately, but under the scientific direction of the Department of Anthropology of the University of California at Los Angeles, archaeological excavations were made in 1959 at one of the largest sites of western Mexico, just north of the village of Amapa, near Santiago Ixcuintla, Nayarit. The site covers an area of at least one square mile and consists of a large number of mounds of various sizes, many systematically grouped around a plaza. Seven thousand intact vessels were encountered in the work. The site is largely post-Classic in time, with many Mazapan-like figurines and copper artifacts. It is closely related to the nearby site of Peñitas.

South America.—In Peru, the Fulbright program of international education enters the last year of its archaeological program with field parties working in valleys along the coast where flood control projects will destroy archaeological sites. A roundup and evaluation study of the findings is in preparation as a preliminary report on the larger monographs to be published later. On the extreme northern end of the Peruvian coast, from Lambayeque to Piura, the American Museum of Natural History had a field party conducting excavations and surveys for the past year. Although it was hoped that links would be found with the Formative period cultures recently defined for coastal Ecuador, the majority of the sites were of a later time, from the Chimu period to the Spanish occupation.

In Brazil, most of the recent work has been on shell middens (refuse heaps) in the state of Paraná under the auspices of the Centro de Ensino e Pesquizas Arqueológicas of the Universidade do Paraná in Curitiba. The Museu Nacional of Rio de Janeiro is also starting an intense survey and excavation of shell middens from Rio de Janeiro southward. These shell middens do not belong to a single culture, as was once supposed, but are rather the result of the refuse accumulated over a long period of time by several groups.

Further work is being conducted on Easter Island by the Universidad de Chile and by visiting professors under the sponsorship of the Fulbright Commission. With the possibility that this island will soon become a tourist resort and that construction of an airfield and resort hotel will destroy some archaeological evidence, salvage archaeology will be conducted in advance of the construction and efforts made to stabilize some of the monuments to prevent their destruction by visitors.

Obsidian Dating.—For several years a research project has been carried out by a number of geologists of the U.S. Geological Survey with the cooperation of archaeologists, especially at the Smithsonian Institution, on a new method of dating. The surface of obsidian (a volcanic glass) is altered as a result of its ability to adsorb water from the atmosphere. Temperature, rather than humidity is the main factor controlling the speed of adsorption. The layer of hydration can be measured by cutting a thin section, examining it under a microscope, and measuring the thickness of the layer in microns. Hydration is most rapid in hot tropical climates and slowest in the Arctic. By measuring artifacts of known archaeological age, rates of hydration have been established for different climatic areas. To date, the work is still highly experimental, most of the samples tested having come from the Western Hemisphere, but the results are highly encouraging. If the hydration layer of obsidian proves to be useful for dating, another means of determining "absolute" dates of archaeological materials will join the ranks of dendrochronology and carbon-14 as important tools of the archaeologist in reconstructing man's history throughout the world.

CLIFFORD EVANS,
Associate Curator, Division of Archeology, U.S. National Museum, Smithsonian Institution.

EASTERN HEMISPHERE

Europe, the Mediterranean area, and southwestern Asia again figured most prominently in the Eastern Hemisphere's archaeological news during the past year. Exceptions were the notable finds of human paleontological remains in China and Africa. A summary of the year's representative events by continents follows.

Europe.—Perhaps the most outstanding discoveries of the year were made in the Mediterranean area in the field of classical archaeology. A number of the finds were accidentally uncovered in the course of urban construction. Such an instance oc-

curred in Piraeus, in Greece, where archaeologists hailed the recovery of outstanding works of sculpture. These were found in the remains of a 2,000-year-old warehouse believed to have been abandoned after a fire during the time Athens was sacked by the Romans in 86 B.C. Prof. Ioannis Papadimitriou, Greek director of antiquities, reported that one of the bronze statues ranked in importance with the great sculpture, *Charioteer of Delphi.*

In the National Museum of Athens was found an extremely complex 2,000-year-old computing machine, believed to have been used to compute planetary orbits as early as 65 B.C. In the course of Greek archaeological excavations at Brauron, on the Attica coast near Athens, a masterpiece of sculpture representing Artemis and her relatives was recovered.

In Italy, the urban expansion of Rome has resulted in several finds in classical archaeology. Excavations in the Vatican area by Italian archaeologists have uncovered ruins identified as the remains of Nero's imperial palace and grounds. Part of Imperial Rome's second largest stadium, the "Variano" Circus, second only to the Colosseum, was discovered in the course of work on a new subway. The remains of the Emperor Heliogabalus' arena, which marked an extravagant period in the decline of Rome in the 3d century, was found between the Palatine and the Aventine hills.

Outside of Rome, an early Christian catacomb was uncovered near the old basilica and abbey of St. Paul Outside the Walls, containing well-preserved tombs and frescoed walls. Skin-diving archaeologists are recovering antiquities on the Tyrrhenian coast, including Etruscan remains dating from about 500 B.C. Skin-divers are also at work off the coast of southeastern Sicily, near Syracuse.

In Britain, a well-preserved mosaic and a fine bronze were found at the Roman site of Verulamium (now St. Albans). The Ministry of Works uncovered the foundations of Nonsuch Palace, built for Henry VIII in 1538 at Ewell in Surrey. The relics of the Roman legion which had been engulfed by local tribesmen about 109 A.D. are being traced at York (ancient Eboracum).

In southern France, the skull of a Cro-Magnon girl found by the University of Harvard expedition under Dr. Hallam Movius, Jr., was found to be about 21,000 years old when dated by the carbon-14 method. A rock carving of Venus, discovered by the same expedition in 1958, was estimated to be about 22,000 years old. A later report disclosed that a French mission had found another Venus, a statuette, near Le Moustier in the Dordogne area.

In Spain, construction work on a U.S. Navy airbase near Rota has unearthed Phoenician tombs about 3,000 years old. A golden treasure of personal adornments was accidentally uncovered near Seville. The treasure supposedly belongs to the Tartessian culture, dating about 550 B.C., between the Bronze and Iron ages.

One of the largest Roman cities outside of Italy was discovered near Xanten, in Germany. It is the remains of Ulpia Traiana, which had a population of 30,000 in 200 A.D. and was a kind of "poor man's Pompeii," having a similar plan and layout. It is being excavated by German archaeologists.

Near Pecs, in southern Hungary, archaeologists have established that a Negroid race of high culture had monumental structures with painted walls about 6,000 years ago. The paintings showed Negroid men hunting tigers, an animal never present in Hungary. This culture seems to show strong connections with Mesopotamia and possibly with the Biblical story of the Flood.

Africa.—Dr. Louis S. B. Leakey, of the Coryndon Museum of Natural History, Nairobi, Kenya, announced the sensational discovery in Olduvai Gorge, Tanganyika, of the fossilized skull of the oldest tool-making man yet known. At least 700,000 years old, the emergent man is believed to be related to *Australopithecus* and has been nicknamed the "Nutcracker Man."

To the north, leading archaeologists under the auspices of UNESCO met in Egypt to ponder ways and means of salvaging the monumental Egyptian structures which will be flooded when the Aswân High Dam is built. The most important antiquity threatened is the temple of Abu Simbel. Also in Egypt, near Giza, excavations were carried out at Abu Rowash by a Dutch archaeological mission. Reported were the discovery of 200 catacombs dating from the Old and Middle kingdoms. A masterpiece of Egyptian architecture was disclosed at Buhen in the Sudan, where a huge fortress was excavated by Prof. Walter B. Emory of the Egypt Exploration Society.

Tunisian archaeologists are examining the ruins of a 4th-century city discovered in the course of pipeline construction south of Tunis—another example of archaeological salvage work.

Asia.—The elements lent a hand to the combined expedition of Harvard and Cornell universities in their work at Sardis, in Turkey. Landslides following winter floods revealed treasures covering 3,000 years of history on the site of Lydia, city of King Croesus. Under the remains of what the team described as "an imposing Roman mausoleum," which had earlier been an ancient Greek burial chamber, diggers found wall fragments identified as belonging to Lydia. Also found in the area were two Roman statues and a "shopping center" of the late Roman and early Byzantine eras, with evidence that one of the shops had later been converted to a Christian chapel.

The work of several foreign archaeological expeditions in Iraq was temporarily postponed. Farther to the south in Bahrein, in the Persian Gulf area, Danish archaeologists discovered the remains of what they believe to have been Dilmun, an ancient city-state which, according to legend, was the home of Noah, and which flourished 4,000 to 5,000 years ago.

A British expedition under Sir Mortimer Wheeler of the London Institute of Archaeology was invited by the Pakistan government to undertake excavations at the site of Charsadda, near Peshawar. Fifty-two successive layers were outlined in this city, which fell to Alexander the Great in 327 B.C.

In Israel, the James A. de Rothschild–Hebrew University expedition under Dr. Yigael Yadin discovered evidence which established that Joshua had conquered Hazor in the 13th century B.C., confirming the Biblical account. Israeli archaeologists also uncovered a Phoenician sanctuary about 2,400 years old, overlooking the Plain of Sharon near Tel Aviv. It had a long and uninterrupted history from the Early Bronze age to Hellenistic times. In southern Israel, in the Negev desert, a 2,000-year-old farm was rebuilt and repopulated with Israeli Bedouins as part of an experimental settlement project. This imaginative scheme to wrest a livelihood from the desert is an effort to emulate the Nabataeans, who once were masters of desert agriculture there.

In Jordan, government archaeologists uncovered the head of a statue of Astarte, the ancient goddess of fertility, in a 4,700-year-old tomb. She

was known as the moon goddess to the Canaanites, Phoenicians, Babylonians, Assyrians, and Carthaginians. At Gibeon, a University of Pennsylvania expedition under Dr. James B. Pritchard unearthed a large and long-sought wine cellar about 2,600 years old. This ancient wine industry of Gibeon came to an end about 600 B.C. when King Nebuchadnezzar carried away the people of Judah to Babylon as exiles.

In China, Communist scientists announced the discovery of the well-preserved lower jaw of a Peking woman, who lived about half a million years ago. It was found by archaeologists of the Institute of Vertebrate Paleontology of the Chinese Academy of Sciences in a cave at Choukoutien, near Peking, where the first fossils were found in the 1920's. Also in China, some of the finest ancient Chinese art treasures were uncovered at the site of the huge Sanmen Gorge Reservoir on the Yellow River. According to the team of government archaeologists, the materials suggest that the Lungshan culture found there was directly descended from the Yang-shao culture, contrary to earlier theories.

In Sarawak, Borneo, Tom Harrison of the Sarawak Museum reported exciting new discoveries from the great cave at Niah. Stratified materials ranged in date from 50,000 B.C. to the Recent period. Crudely painted "ships of the dead" were found in other newly discovered caves.

New dates for Polynesian history were obtained by the American Museum of Natural History's archaeological expedition to the Marquesas Islands in 1959. The expedition director, Dr. Harry L. Shapiro, reported discoveries from the 2d century B.C. that established an earlier date for the settlement of Polynesia than had been thought.

Darwin Centennial.—The Darwin Centennial in honor of the 100th anniversary of the publication of Charles Darwin's *The Origin of Species* was celebrated in Chicago in November 1959. (See also ANTHROPOLOGY; GENETICS.) It was attended by many experts who discussed the effects of Darwin's theory of evolution on the study of life, man, and the mind.

ARCHERY. See SPORTS, GAMES, AND SHOWS.

ARCHITECTURE. In the year of the death of Frank Lloyd Wright (q.v.), the world was a long way from achieving the "organic" architecture toward which he had looked. Modern architecture, not yet accepted in some quarters, was regarded in others as already obsolete. The new State Office Building in Louisville, Ky., for instance, was to be built in a style described by its architect as "governmental Georgian" because it was feared that a contemporary building might not be acceptable; but elsewhere the contemporary curtain wall, a very recent innovation, had been used with such frequency that it was, by 1959, regarded in some quarters as rather old-fashioned, and an article called it "one of the most irritating eyesores on the U.S. scene."

A major contributor to the rapidly changing point of view was certainly the unprecedented amount of new building all over the world, as well as the giant scale of many of the projects architects are being called on to design. The volume of building presents the chance to experiment, but introduces as well a powerful compulsion toward change, toward new forms for their own sake, as well as forcing a serious search for methods of bringing order to whole areas and even to entire cities which are being newly built. This search has often resulted in special attention to structure —exposed, dramatized, even exaggerated.

Scale.—It was becoming apparent during 1959 that in many places the whole environment was being rebuilt (as in New York, where the curtain wall was transforming midtown Manhattan) or being newly built (as in suburbs everywhere). Meanwhile the federal highway program (see HIGHWAYS) was making profound changes, often as poorly integrated with urban buildings as in San Francisco, where the Board of Supervisors, acting to save the city's compact downtown area, actually stopped construction of freeways planned by state highway engineers.

With the environment changing so rapidly, it is not surprising that there was great interest in projects large enough to control the whole environment. Business campuses in the country, for example, like that for the International Minerals and Chemicals Corporation in Skokie, Ill., by Perkins and Will, and the Monsanto Chemical Company's office campus in St. Louis, Mo., by Vincent Kling, attracted attention. So did such college campuses as that of Concordia Senior College in Fort Wayne, Ind., by Eero Saarinen and Associates, and such facilities as the Central Service Facility of the Washington Water Power Company (on a 28-acre riverside site in Spokane), whose architects were Kenneth W. Brooks and Bruce M. Walker.

Abroad, whole new cities were in the making. Brazil's new capital, Brasília, being readied for occupancy, was notable for the boldness of architect Lúcio Costa's ten-mile-long, crescent-shaped plan, as well as for the dramatic flair of its public buildings, all by Oscar Niemeyer, from the presidential palace held aloft on light fantastic concrete wings to the uncompromisingly rigid block of a large hotel.

Progressive Architecture magazine's first award-winner for the year was also in the field of urban design—a project by Wurster, Bernardi, and Emmons, Edward Larrabee Barnes, and De Mars and Reay for Capitol Towers, Sacramento, Calif.

Structure.—For the effect it had on architects' imaginations, the most influential material in 1959 was concrete. On thin shells, like the sail-shaped roofs of Joern Utzon's winning design for the Sydney Opera House in Australia, or on the soaring undulations covering Félix Candela's Los Manantiales Restaurant at Xochimilco, Mexico, increasing attention was given to detailing, to demonstrate the shells' lightness and to make them seem to float. Pier Luigi Nervi's circular sports palace in Rome (one of three stadiums which he has designed for the 1960 Olympics), which will seat 16,000 people, uses concrete over vast spans. Skidmore, Owings and Merrill, given the job of developing an American building for the Banque Lambert on a major boulevard in Brussels, Belgium, but wishing to avoid too glassy a look among monumental buildings, created outside the glass walls a structural skeleton of precast pieces of concrete joined at the center of each story so as not to disturb the continuity of beam and column at each floor level.

The development of precasting and prestressing techniques encouraged architects to think of concrete as a precision material available in separate pieces capable of being accurately fitted together. Louis I. Kahn's recent work, especially his Medical Research Laboratory at the University of Pennsylvania, is noteworthy for the particular care given to the detailing of heavy concrete members so carefully dimensioned and finished that they fit together as neatly as the wooden pieces on a traditional Japanese house.

Not surprisingly, similar interests have resulted in a series of important new concrete buildings in Japan. Kenzo Tange's Kagawa Prefectural Office is an especially successful example. The dramatization of large pieces of concrete fitted together has also absorbed Le Corbusier, whose National Museum of Western Art in Ueno Park, Tokyo, has paralleled and influenced the Japanese examples. Another Le Corbusier work, a Dominican monastery near Lyon in France, is heavily concrete and rectilinear and bears far more resemblance to his Tokyo museum than to the curvilinear forms of his famed chapel, Notre Dame du Haut, at Ronchamp.

New Forms.—A striking characteristic of the architectural magazines and of many of their subscribers during the year was a constant search for newness. The work of some of the influential younger men was called the New Sensualism. New Brutalism was another term used to identify some recent work; and a "new solidity," a "new . . . immediacy of image," "new action," "the new radical architecture," "a new topology," "a new tradition," and even "the new modern" were appellations invoked. Some recent work of modern architects in Italy, with a surprising degree of recall of the forms of the turn of the century, was labelled "neo-Liberty." Even "neo-classic" and "neo-Palladian" applied to a modern building, which would have been fighting words a few years earlier, were used without apparent malice to describe the works of Philip Johnson. His newest projects, forsaking the disciplined regularity of New York City's Seagram Building, which he designed with Ludwig Mies van der Rohe, made frequent use of forms which curved smoothly into one another.

Johnson's projected colonnade in the Lincoln Center for the Performing Arts in New York was a work of fantasy with the mood of a stage set. The same sort of fantasy appeared in the domed pavilions of Minoru Yamasaki's projected additions to the Detroit Museum of Art, and in designs by The Architects' Collaborative (Walter Gropius and associates) for Iraq's University of Baghdad. Even Paul Rudolph's laboratory for the School of Forestry at Yale University, with tree-shaped roof supports, was described by the *Architectural Forum* as having curves reminiscent of Art Nouveau.

There was increasing frankness among some younger architects about such reminiscences. There was apparent, too, an increasing willfulness in the creation or exaggeration of forms for visual effect, as in Paul Rudolph's Jewett Arts Center at Wellesley College, a contemporary building on a Gothic campus, whose sunshades, for dramatic effect, extend past the walls they protect, and whose high skylights are introduced partly to make the building's silhouette relate to the spiky Gothic forms nearby. Another example, Italian architect Gio Ponti's new building in Stockholm for the Italian Swedish Institute, is described as Italian on the inside and Swedish on the outside. This all seemed in strong contrast to Frank Lloyd Wright's idea of style, expressed by architect Louis I. Kahn on Wright's death: "Wright gives insight to learn that nature has no style, that nature is the greatest teacher of all. The ideas of Wright are the facets of this single thought."

ERNEST BRAUN

Two views of the Dunbar Carpenter residence at Medford, Oreg., which won an award of merit in the 1959 competition for outstanding architecture staged by The American Institute of Architects. The architect of this winning entry, one of three selected by the jury, was George T. Rockrise of San Francisco.

Residences.—Residential design, too, was characterized in 1959 by vast volume and by a wide variety of forms. Emphasis in the publications fell on large and elaborate houses like the concrete framed F. A. Deering house on Casey Key, Florida, by Paul Rudolph. The house is rectangular outside, but inside its ten rooms are arranged on five different levels overlooking the water. The Miller house in Chappaqua, N.Y., by Edward Larrabee Barnes, achieves equal opulence with different forms, under gables filled with colored glass.

A.I.A. Awards.—Three of the American Institute of Architects' five First Honor Awards for 1959 went to buildings and groups of buildings designed on a scale large enough to control the whole environment: the Concordia Senior College campus and the Washington Water Power facility, both mentioned above, and the May–D & F Department Store of the Zeckendorf Plaza Development in Denver, Colo., by I. M. Pei and Associates, Architects. The two smaller buildings which received awards are notable for their elegance. They are the McGregor Memorial Community Conference Center at Wayne University in Detroit, Mich., by Minoru Yamasaki and Associates, and the Diaz-Simon Pediatric Clinic, on a narrow lot in New Orleans, La., whose architects were Colbert and Lowery and Associates.

CHARLES W. MOORE,
Associate Professor of Architecture, University of California, Berkeley.

ARCHIVES, National. See NATIONAL ARCHIVES AND RECORDS SERVICE.

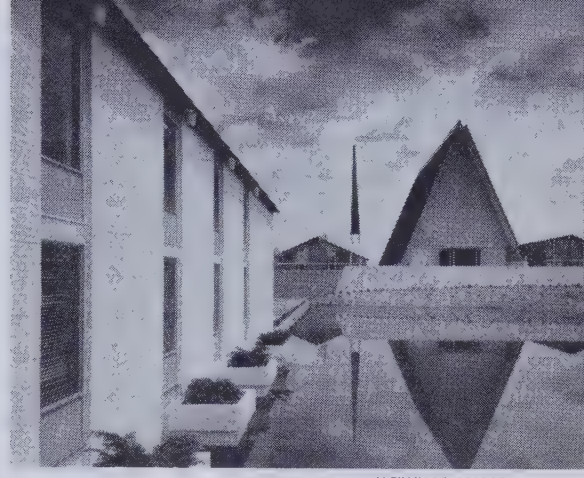
ARCTIC EXPLORATION. The International Geophysical Year, 1957–58, gave tremendous impetus to polar scientific research, and under the continuation of the IGY (now called International Geophysical Cooperation—1959, or IGC) many of these activities were continued in 1959. It appears that some of these investigations are becoming almost permanent in nature. The investigations of stratospheric physics, especially ozone content, were continued at several North American Arctic weather stations, as were measurements of short-wave (solar) radiation and long-wave (terrestrial and cloud) radiation at Alaskan and northern Canadian stations.

The Arctic Institute of North America in 1959 supported 28 Arctic research projects, involving about 60 field workers, scattered from Point Barrow on the northern coast of Alaska through the Canadian Archipelago to the mountains of Labrador, where a small party studied effects of glaciation on the coastal landscape. Another party spent the summer in the Belcher Islands of Hudson's Bay, investigating both the marine life and the breeding habits of ducks. At the Arctic Research Laboratory, Point Barrow, long-term studies of the physics of permanently frozen ground were continued in 1959, as well as investigations of geology, soil, and vegetation characteristics. Lake temperatures and oxygen amounts were measured in lakes north of the Brooks Range, as well as lake ice strength and melting.

Glaciology.—In southern Alaska and in the Olympic Mountains of the State of Washington, IGY studies of the mass (snow and ice) budget of maritime glaciers were continued in 1959, in order to learn more about the meteorological factors important in the snow accumulation and melting. Similar studies, in higher latitudes, were undertaken on the Gilman Glacier in northern Ellesmere Island. The Canadian station there, at Lake Hazen, was open during the summer of 1959 for further glaciological and botanical studies. North of the mountain range which shelters Lake Hazen from the Arctic Ocean, another expedition worked on the coastal ice shelf of northern Ellesmere Island. This party consisted of American and Canadian scientists, who studied the meteorology and ice characteristics during the summer (melting) season. It is from this ice shelf that large pieces have broken off to form the so-called "ice islands" which drift in the Arctic Ocean surrounded by the polar sea pack ice.

A small Canadian party of four members spent the latter part of the 1959 summer on Axel Heiberg Island, at latitude approximately 80°N., preparing for a larger expedition in 1960. The main objects of this research will be the study of the glaciology and meteorology of the central and northern parts of the island, as well as geology and permafrost.

The Greenland icecap is still being investigated, mainly in its northern parts. The U.S. Army Corps of Engineers continued its investigations near Thule of the conditions of surface living and travel over large distances, and its examination of ice movement and physical characteristics, both from the surface and under the edge of the icecap. A two-year international expedition in Greenland, consisting of Swiss, German, Austrian, Danish, and French members, under the direction of Paul Émile Victor, was established in 1959 on the site near Station Central which was occupied by a large French expedition in 1949–51. The expedition will continue the survey of the central icecap and the attempt to establish, by depth soundings,



ALEXANDRE GEORGES

Concordia Senior College, Fort Wayne, Ind., won a first honor award of The American Institute of Architects in 1959. Triangular-shaped chapel dominates this view of the campus, designed by Eero Saarinen & Associates, of Michigan.

whether Greenland is a single large island or a group of islands overlaid by ice.

Arctic Ocean.—The polar basin has reached the forefront of scientific interest. With long-distance flying and the employment of submarines in oceanographic research planned for the near future, a much more detailed knowledge of atmospheric and oceanographic conditions is imperative. Such information is now being collected. The United States, as before and during the IGY, maintains occupied research stations on floating ice islands, as well as on the drifting polar pack ice itself. In 1959 the scientific station on ice island T-3 was in full operation, with American and Canadian scientists doing research in meteorology of the high layers of the polar atmosphere, as well as the air layer close to the ice, and also in ice melting, depth of the ocean, and temperature and density of the sea water. A new United States ice floe station, C, was established on June 5, 1959, to replace the former Station A, set up in 1957 and abandoned in November 1958 after drifting toward the North Pole and splitting. Until January 1960, when this station, too, had to be abandoned, scientists continued investigations of sea ice physics, marine biology, sea water salinity, depth of the ocean, topography of the bottom, and the exchange of heat—through ice of some 10 feet in thickness—between the Arctic Ocean waters (with a temperature of +32°F.) and the atmosphere (which in winter drops to −58°F.).

The United States nuclear submarine *Skate*,

Crewmen obtain ice samples for testing during Arctic surfacing of nuclear submarine U.S.S. *Skate* in March 1959.

U.S. NAVY

during a trip to the region in March 1959, made depth soundings of the earth's floor and undertook studies of the varying thickness (or "profile") of the ice. In the course of the trip the *Skate* set a record by remaining under the ice for 12 days and logging 3,090 miles. (See also NAVY, U.S.)

The USSR also continued in 1959 to operate ice floe stations in the Arctic, as it has for the past decade. The Soviet news agency Tass reported, however, that on September 14 a scientific group had abandoned the ice floe (Station SP6) on which it had drifted, near the North Pole, for three and one half years.

In the Svalbard Archipelago the Norwegian Polar Institute continued the long-term scientific investigation into geology, glaciology, zoology, and surveying in which that institute has been engaged since its foundation in 1948.

SVENN ORVIG,
Associate Professor of Meteorology,
McGill University.

ARGENTINA. A wedge-shaped land pointed toward the Antarctic, Argentina is bounded on the west by Chile, on the north by Bolivia and Paraguay, on the northeast by Brazil and Uruguay, and on the southeast by the Atlantic Ocean. Its 1,072,745 square miles extend 2,300 miles from north to south and, at the widest point, 1,000 miles from east to west; but the country is best known for the fertile plains, the pampas, which fan out in an 800-mile radius from the capital city of Buenos Aires. Over one fourth of Argentina's 20,438,000 inhabitants (est., Dec. 31, 1958) live in the metropolitan area of Buenos Aires, with 3,703,400 (est., mid-1957) in the city itself. Next in size (est. 1954) are Rosario (616,718) and Córdoba (510,739). Spanish is the language of the people, 81% of whom are native born, 16% European by birth, and only 3% of Indian or other origin.

Government.—Argentina is a federal republic of 23 provinces (1 unconstituted), and a federal district. The executive branch of the national government is headed by President Arturo Frondizi, who began his 6-year term on May 1, 1958. Legislative power is vested in a 46-member Senate, in which the provinces and the federal district are each represented by 2 senators, and a 187-member Chamber of Deputies, where representation is proportional to population. The judiciary is composed of a Supreme Court, 5 appeal courts, and the usual minor courts.

Religion and Education.—Most Argentinians profess the state-supported Roman Catholic religion, and both the president and vice president must be of that faith. Those of other beliefs have complete freedom of worship.

The rate of literacy is very high, for education is both free and compulsory for all children between the ages of 6 and 14. As of 1954, there were 16,189 primary and 459 secondary schools with, respectively, 109,669 and 15,948 teachers to care for the 2,565,164 and 102,742 pupils. There are also technical and normal schools, in addition to 7 national universities.

Finance.—The year 1959 began with an austerity program designed to cut deficits in government operations, halt inflation, and restore economic and financial stability. The official rate of exchange of 18 pesos = U.S.$1 was replaced by a fluctuating rate to be determined by supply and demand, and when free trading began on January 12, the peso opened at 64 to the dollar. Immediate results were a rise in the cost-of-living index (1953 = 100), from 324 in January to 497 in July; an increase in currency in circulation, from 71,352.4 million pesos on Dec. 31, 1958, to 87,210.1 million on July 15, 1959; and, on June 2, a fall in the value of the peso to an all-time low of 107 to the dollar. The middle of the year seemed, however, to mark a turning point, for between June 30 and August 31 the Central Bank's gold and foreign currency holdings rose from 7,470.4 million pesos to 12,234.6 million. By September 15, currency in circulation had decreased to 82,933 million pesos, while the exchange rate was up to 83 pesos to the dollar. Nontheless, Minister of Economy Alvaro C. Alsogaray reported that the domestic public debt totaled 116,488 million pesos, to which should be added provincial (7,618 million) and municipal (793 million) debts.

At the end of September, when President Frondizi submitted for congressional approval the national budgets for the fiscal years 1958–59 and 1959–60, the deficit for 1958–59 was estimated at only 38,517 million pesos, including 32,433 million attributable to state enterprises. For 1959–60 the deficit forecast was 27,216 million pesos.

Transportation and Communications.—Although Argentina has over 40% of the total railway trackage in South America, its 27,873-mile network is concentrated in the agricultural eastern and north-central section, with about 33% of the mileage in the single province of Buenos Aires. The railway operating deficit for the fiscal year 1958–59 was forecast at 14.1 billion pesos.

Only about a third of the 36,660-mile national highway system is either paved or improved, although the government has announced a 5-year program to construct 1,554 miles of new paved highways and 2,175 miles of new improved roads. In the provinces road construction plans center largely on feeder roads for farm development. Highway transport equipment is in poor condition, although 603,765 motor vehicles were registered at the end of 1958.

Air transport service is provided by Líneas Aéreas del Estado (operated by the Military Transport Command), by the government-owned Aerolineas Argentinas, and by several private lines, among which Transcontinental, S.A., which was organized in 1958, joins some 20 foreign lines in providing international service. The most noteworthy development in air service during 1959 was the initiation of jet transport service with British Comet IV planes.

More than 90% of the telephone system is owned and operated by the government. On April 1, 1959, Argentina had 1,128,537 telephones in use, or about half of those in South America. Commercial radio broadcasting is carried on by 55 long-wave stations, and a television station has been operating since 1951.

Agriculture.—About 40% of the Argentine land is devoted to pasture, some of which is in alfalfa and planted grasses, and only 10% is utilized for crops planted for harvest, yet over 90% of the value of the country's exports usually comes from wheat, corn, hides and skins, and other staples. The official wheat crop estimate for 1958–59 was 6,720,000 metric tons. Production of other leading crops in 1958, in thousands of bushels, was as follows: corn, 215,000; barley, 52,000; rye, 32,160; and flaxseed, 23,621. In addition, Argentina produced 836,200 short tons of sunflower seed, 500,000 bales of cotton, and, in 1958–59, 1,185,000 short tons of sugar and 250,000,000 pounds of rice.

The flooding of cattle grazing areas in 1959 reduced pasturage and necessitated further slaughtering of breeding stock already depleted by rancher discouragement over low prices and government marketing controls. As a result, meat export quotas were cut to assure domestic supplies while the herds were being rebuilt. In 1958, Argentina produced 4,299 million pounds of meat (1,596 million exported) and about 14.3 million bovine hides and skins. Low sales of wool and the production of 182,000 metric tons in the year ending Sept. 30, 1958, left an accumulated exportable surplus of 224,800 tons, while the 1958–59 clip was estimated at 190,800 tons.

Industry.—Labor unrest and raw material shortages resulting from import restrictions are a hindrance to Argentine industrial production; in the first half of 1959 the index (1953 = 100) averaged 113, as compared with 125 for the year 1958. Both in value of production and in number of workers the food production industries rank highest. Argentina can also rely on domestic wool and cotton for its textile mills, and most of the tobacco used in manufactured products also is home grown. For the manufacture of wood products, paper, and cardboard, however, the country is largely dependent on imported lumber; even though 30% of its own land is forested, the forests are badly located for exploitation.

Despite an estimated annual demand for 1.8 million metric tons of steel, import restrictions and a domestic production of only 236,400 tons kept 1958 consumption down to 1.1 million tons. Pig iron production at the new $250 million San Nico-

lás mill was not scheduled to begin until January 1960, and only the completion of extensions begun at the Zapla steelworks would allow the present output of 40,000 metric tons of pig iron to be raised to 150,000 tons. Cement production in 1958 totaled 2,472,000 metric tons; that of electricity, 7,296 million kw.-hr. In the rapidly expanding automotive industry, production reached 61,082 units, of which Industrias Kaiser Argentina accounted for 10,342 station wagons, 7,221 jeeps, 2,891 pickups, and 2,157 Carabela cars.

Mineral Products.—Argentina is not an important mineral producing country, although lead (39,400 metric tons in 1958), zinc (76,500), tungsten (925), and beryllium (915 tons for 11 months) are found in some abundance. There are iron deposits in Jujuy Province and iron and manganese in Río Negro. In Santa Cruz (Patagonia) Province transport and technical problems have so limited commercial production at the Río Turbio coal deposits that the 1959 output was forecast at only 300,000 metric tons.

The most immediate mineral need is for petroleum, the importation of which cost almost $250 million in foreign exchange in 1958. With the help of a number of foreign oil companies admitted in 1958 to participation in the national exploration and development program, output for the first half of 1959 rose 29.1% over that in the same period of the previous year and totaled 3,022,349 cubic meters. Output for the year was forecast at 47.5 million barrels, as compared with 35.8 million in 1958.

Foreign Trade.—The 1958 trade deficit, from imports valued at $1,233.2 million and exports at $993.9 million, amounted to $229.3 million. Leading imports, by value, were machinery and vehicles (24%), fuels and lubricants (20%), and iron and steel (18%); the principal export was meat (30%), followed by cereals and flaxseed (26%), other arable farm products (16%), wool (10%), and hides (6%). Among favorable trade balances were those with the United Kingdom and the Netherlands; leading deficits occurred in trade with Venezuela and with the United States, which furnished 16% of Argentina's imports and took 13% of its exports.

The 1959 Argentine trade figures differ to the point of apparent irreconcilability. Officially there was a surplus in the first half of the year, with exports valued at $490.2 million and imports at $363.8 million, but the import figure covered only goods which had cleared customs; at the end of June, merchandise worth $232 million was piled up in customs sheds awaiting admittance.

Principal Events, 1959.—On January 18, President Arturo Frondizi set out from Buenos Aires on an official visit to the United States. Behind him he left his country in the midst of a general strike (January 17–21), with the maintenance of order delegated to military commanders. It was a situation prophetic of a year characterized by labor unrest and by reliance on the armed forces for the support of constitutional government until the nation's basic economic problems could be solved.

When the president returned on February 2, he found that the strike had been broken. Hundreds of labor leaders were in jail, and 12 major union headquarters were being run by military administrators. Nevertheless, the strikes were to continue throughout the year: in the first 6 months alone there were an estimated 201, including maritime strikes paralyzing the port of Buenos Aires, a strike at the Kaiser automotive plant in Córdoba, and a bank workers strike that lasted from April 16 to June 20. Wage increases were won, and, in a further conciliation of labor, the mobilization of 330,000 oil, railroad, and municipal transport workers, which had been in effect since November 1958, was ended on June 30.

An April 3 general strike, called by the metal workers' union, became instead a demonstration against the high cost of living and the infringements on union rights. The ensuing battles with the police were related to the government's decision (April 7) to expel from Argentina Nikolai Belous, counselor of the Soviet embassy, on the charge that he had instigated the disturbances; four others (three Russians and one Rumanian) were also declared *persona non grata* because of their involvement in agitation (April 8). On June 8, the Bulgarian minister, Boris Popov, became the sixth Communist diplomat to become similarly unwelcome.

A third source of unrest was the heritage of mutual distrust left to the Argentine people by Juan Domingo Perón. This attitude was most strongly fixed among the leaders in the armed forces who had driven the former dictator so ignominiously from his native land in 1955, and it was their pressure on the administration that on May 13 forced the "resignation" of the president's personal economic adviser, Rogelio Frigerio, who was regarded as Frondizi's chief negotiator for Peronist support. In June, photostatic copies of a pre-electoral pact with Perón (reportedly negotiated for the president by Frigerio), bearing the signatures of the two men, were made public. Although the government called the document a forgery, it served to anger Peronists because of the nonfulfillment of its promised grant of legal status to their party, while it increased the distrust of many who recalled the president's appeals for Peronist and Communist support in the 1958 election.

The attempted revolution that Perón had apparently hoped to incite, and which actually followed, was the work not of Peronists, but of anti-Peronist army and navy officers led by Lt. Gen. Arturo Ossorio Arana and Rear Adm. Arturo Rial and publicly supported by Rear Adm. Isaac F. Rojas, vice president in the regime that overthrew Perón. On June 19, however, the president won a general pledge of support from military leaders who preferred the maintenance of constitutional government to revolution; in return, he was forced three days later to agree to a major government reorganization. Of leading importance in the new cabinet was Dr. Alvaro C. Alsogaray, who received the portfolios of Economy and of Labor and Social Welfare on June 25.

Even as the past revolt ended, a new one threatened—this time, a service rivalry. Angered that Navy Secretary Adolfo B. Estévez had issued a statement supporting the president in the June

Argentine President Frondizi and wife, Elena, shown leaving Buenos Aires on January 18 for visit to the United States.

WIDE WORLD

army crisis without consulting other high naval officers, 14 admirals met in protest on July 14 and requested his dismissal. When the president refused, navy resignations followed. By July 24, after the dismissal of the chief of naval operations, Vice Adm. Alberto Vago, who had led the revolt against Estévez, the navy was near mutiny. On the next day, Admiral Vago was reinstated, and the secretary dismissed.

Meanwhile, elections in two provinces indicated that dissatisfaction with the administration was by no means confined to labor or the armed forces. The election in Mendoza on April 26 was won by conservative Democrats with 84,302 votes, as compared with 72,136 blank votes attributed to Peronists and 52,765 gained by the president's Intransigent Radical Party. The Communists won 34,415 votes. In Santa Fe's July 26 election, Peronists and opposition Radicals dominated the returns. The Communists gained 22,881 votes.

Since strikes continued and the loyalty of at least some members of the armed forces had become doubtful, the more conciliatory labor policies of Minister Alsogaray were adopted. On July 7, a threatened strike of light and power workers was averted by a pattern-setting 41% wage increase. Other unions took due note, notably those of the commercial employees and the sugar workers of Tucumán, both winning increases despite the government's desperate need to keep the wage front from crumbling. Not only could federal employees be paid only half their wages in July, but Alsogaray admitted that the government had taken half the money out of the pension funds in exchange for promissory notes. On September 15, railroad workers threatened a 24-hour strike for September 23 and said they would walk out every fifth day thereafter until the government granted their demand for an improved pension plan. A general strike, called for September 23–24, failed largely because the railroaders, having won their demands, agreed to stay on the job.

New discontent developed in the army on September 2, when Secretary of War Elbio C. Anaya dismissed the anti-Peronist chief of staff, Gen. Carlos Severo Toranzo Montero, after a dispute over appointments and swore in (September 3) in his place Gen. Pedro Castineiras, an officer sympathetic to Peronists. Asserting that 95% of the army was behind him, Toranzo Montero called for support, while Anaya ordered the arrest of 14 high-ranking anti-Peronist officers who answered the call. The Córdoba garrison indicated its loss of confidence in Anaya, requested his resignation, and said it would receive orders only from Toranzo Montero, who had set up headquarters in the Army Mechanical School in Buenos Aires behind barricades of hundreds of buses. The lack of response both to the government's order for 60 tanks and to its alert to the air force led to conferences (September 4) between the president and Toranzo Montero that resulted in the officer's reinstatement and in the replacement of General Anaya as secretary.

On November 25, Argentina and Brazil signed a cultural exchange treaty in Buenos Aires, and on the following day they also signed new trade treaties. At the same time, they reached agreement on problems of mutual defense, particularly with regard to subversion.

ARIZONA. Southwestern state, United States; admitted to the Union, Feb. 14, 1912. The "Grand Canyon State" ranks 6th in area and 35th in population among the 50 states.

Area and Population.—Area: 113,909 square miles (land, 113,575; inland water, 334), divided into 14 counties. Population: (1950) 749,587; (est., July 1, 1958) 1,175,000. Urban places with 1950 populations above 7,500 (unless another date is indicated):

Amphitheater[1]	12,664	Phoenix (*capital*)	365,000[3]
Douglas	9,442	Tempe	7,684
Flagstaff	7,663	Tucson	48,774[2]
Glendale	8,179	Wakefield[1]	8,906
Mesa	16,790	Yuma	9,145

[1] Unincorporated. [2] Special census, 1953. [3] 1959 estimate.

Executive.—Chief state officers in 1959:
Governor: Paul J. Fannin (Republican)
Secretary of State: Wesley Bolin
Treasurer: H. Y. Sprague
Attorney General: Wade Church
Auditor: Jewell W. Jordan
Supt. of Public Instruction: W. W. Dick

Constitution and Judiciary.—The present constitution went into effect in 1912. The Supreme Court comprises five justices; chief justice in 1959 was M. T. Phelps.

Legislature.—The Arizona Legislature (Senate, 28 members—two per county; House of Representatives, 80 members—apportioned to the 14 counties every four years on the basis of their gubernatorial vote turnout) meets annually, commencing the second Monday in January. Party composition of the legislature in 1959 was: Senate, 27 Democrats and 1 Republican; House, 55 Democrats and 25 Republicans.

The 1959 session (January 12–March 21) passed 146 bills, and one private bill was vetoed by the governor. Legislation of special significance included a school equalization aid bill and education excise tax. The latter, a 1% tax on sales, will be used to support equalization aid to public school districts on an average daily attendance basis. Other enactments raised public assistance payments for dependent children and the aged and blind—the first such increase in a decade; tightened restrictions on drunken and reckless driving and on driving without a license; regulated boating and water sports; authorized county flood-control districts; authorized the state Tax Commission to assess value of producing oil and gas interests; established a commission to regulate gas and oil drilling and production; and amended the method of filling vacancies on county boards of supervisors.

One constitutional amendment was proposed at the regular session, to be voted on by the voters in the 1960 general election. The measure would permit employment by the state of aliens as teachers, if they are authorized to teach in the United States under the teacher-exchange program as provided by federal statutes.

Finance.—State revenue of $161,101,189.21 for the 1958–59 fiscal year consisted of $87,350,305.96 from state taxes, $47,572,481.78 from the federal government, and $26,178,401.47 from all other sources. Major tax sources were a 2% general sales tax, selective sales and gross receipts taxes, and individual and corporate income taxes. Expenditures of $155,413,767.59 comprised $51,981,024.04 for education, $34,688,488.60 for health, welfare, and safety, $56,317,946.72 for highways, and $12,426,308.23 for other purposes.

Banking.—As of June 10, 1959, the state's 3 national banks had $926,094,000 in assets, $582,418,000 in demand deposits, and $267,280,000 in time deposits. The 4 state banks (June 30, 1959) had assets of $264,302,619, demand deposits of $131,475,893, and time deposits of $74,552,584.

Education.—School attendance is compulsory between the ages of 8 and 16, inclusive. Operating expenditures of $94,187,337.07 ($389.03 per pupil) for public elementary and secondary schools in the 1958–59 school year comprised $60,803,344.98 from local school districts, $28,827,599.75 from the state, and $4,556,392.34 from the federal government. Outlays for construction and improvements amounted to $20,385,545.57. The National Education Association estimated teachers' salaries as averaging $5,328 (high school, $5,790; elementary, $5,118).

In the 1958–59 school year there were 496 elementary schools (grades k-8) with 7,721 teachers and 220,318 pupils, and 89 secondary schools (9–12) with 2,591 teachers and 62,148 pupils. Private and parochial elementary and secondary schools enrolled 23,818 pupils. There were 29,607 college and university students.

Social Welfare.—Public assistance expenditures from state and federal funds (excluding institutional costs) for the 1958–59 fiscal year totaled

$21,185,743.54, and included $9,421,672.52 for the aged, $8,010,233.84 for dependent children, and $1,554,228.17 for general relief. A monthly average of 25,820 persons received assistance.

The state spent $2,904,991.96 for the operation of a hospital for the mentally ill (1,638 patients on Sept. 18, 1959) and one for the mentally deficient and epileptic (650). Penal and correctional institutions include a training school for delinquents and a state prison (1,463 inmates).

Labor Force.—The state's labor force in June 1959 totaled 416,200, including 46,600 agricultural workers. Nonagricultural employment was up to 349,400 from 332,700 in the previous June and also above the 345,300 average for the 12 intervening months. Government services accounted for 20% of nonfarm employment; trade for 24%; manufacturing for 15%; and service industries for 13%. Unemployment was down to 19,500 in June 1959 from 23,200 a year earlier. An additional 1,500, chiefly copper mining employees, were involved in labor-management disputes. Gross unemployment compensation payments for the year ending June 30, 1959, totaled $8,324,496.

Manufacturing.—Some 650 manufacturing establishments in 1959 employed an average of 39,200 persons who received $212,517,762 in wages. Value added by manufacture (1957) totaled $336,275,000. Production workers in manufacturing averaged $96.62 for an average workweek of 39.6 hours in August 1959.

The major manufacture is that of transportation equipment, which in 1957 engaged 12,789 persons who received $72,132,000 in wages. Value added by manufacture totaled $135,641,000. Other important industries were food processing (5,318; $22,200,000; $41,132,000) and primary metals (4,942; $26,215,000; $38,278,000).

Mining.—Arizona ranked 16th among the states in the value of mineral output in 1958, with 1.90% of the national total. For the 49th successive year it remained first in the output of copper (50% of the United States total). It was also first in pumice; second in manganese; third in molybdenum, silver, and vanadium; fourth in beryl and perlite; fifth in gold, lead, and uranium; and sixth in zinc. Metals comprised 92% of the value of all minerals produced. As of Dec. 15, 1958, 16,200 persons were employed in the state's mineral industries.

ARIZONA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	119,000	$ 179,000
Copper (recoverable content of ore)	485,839	255,551,000
Gold (troy ounces)	142,979	5,004,000
Lead (recoverable content of ore)	11,890	2,782,000
Lime	126,000	1,817,000
Manganese ore	62,279	5,220,000
Molybdenum (pounds) (Mo content)	2,320,000	2,827,000
Pumice	401,000	1,025,000
Sand and gravel	12,208,000	9,526,000
Silver (troy ounces)	4,685,000	4,240,000
Stone	1,528,000	2,731,000
Uranium ore	257,756	7,049,000
Zinc (recoverable content of ore)	28,532	5,821,000
Other minerals	...	11,953,000
Total	...	$314,520,000[1]

[1] Total has been adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines and the Arizona Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped slightly to $261,973,000 from $265,565,000 for the same period of 1958. For the full year 1958, which yielded the highest agricultural income in the state's history, income comprised $163,782,000 from livestock and livestock products (including $131,025,000 from cattle), $271,800,000 from crops, and $5,163,000 from government payments. Cotton continued to be the most profitable field crop.

ARIZONA CROP INCOME

Crop	Cash receipts 1957	1958
Barley	$ 8,249,000	$ 7,412,000
Cantaloups	10,688,000	10,826,000
Cotton lint	130,276,000	130,612,000
Cottonseed	15,350,000	14,596,000
Grapefruit	2,411,000	4,011,000
Hay	13,251,000	14,110,000
Lettuce	30,446,000	47,925,000
Oranges	4,019,000	6,342,000
Potatoes	3,060,000	4,480,000
Sorghum grain	5,706,000	3,864,000
Wheat	4,519,000	6,118,000

(Source: U.S. Department of Agriculture.)

The state had 10,000 farms in 1958. Total acreage (1954) of 17,944,000 included 5,536,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 971,000 cattle and 782,000 chickens (excluding commercial broilers). There were 324,000 family and hired workers engaged in farming during the week of Oct. 19–25, 1958.

Transportation and Communications.—State and federal funds spent for highways in the 1958–59 fiscal year totaled $37,977,791, and 210 miles of new construction were completed.

Highways and roads on Jan. 1, 1959, totaled 33,280 miles (9,275 surfaced). Registered *motor vehicles* numbered 579,568 on the same date, including 407,818 passenger cars. There were (1958) 6 *railroads* operating 2,531.75 line miles; 5 regularly scheduled *airlines;* and (1959) 183 *airports and airfields* (100 commercial and municipal, 13 military, 64 private, and 6 other).

Communications media (1959) included 48 AM and 3 FM *radio stations;* 8 VHF and 2 UHF (educational) *television stations;* 17 daily *newspapers* (circulation, 291,340) and 67 other newspapers (102,514); and (January 1) 126,900 business and 231,100 residential *telephones.*

Principal Events, 1959.—Events of significance were initiated with the January 5 inauguration of Paul J. Fannin as Arizona's 11th governor (fourth Republican). Principal features of the governor's legislative program were school aid and traffic safety, both of long-standing interest and controversy. Despite affirmative legislative action (see above, *Legislature*), traffic fatalities continued to exceed the 1958 rate.

For the second time in the last decade (previously in 1950) the City of Phoenix was selected as an "All American City" by *Look* magazine and the National Municipal League. Other commemorations saw the University of Arizona, Tucson, and Arizona State University, Tempe, initiate 75th anniversary celebrations.

Simon Rifkind, special master in chancery acting on behalf of the U.S. Supreme Court, concluded hearings regarding distribution of Colorado River water. A final decision was not expected before 1960.

Mineral production in the state was off considerably because of strikes in the Bisbee, Morenci, Superior, and San Manuel areas. Principally affected were the Phelps-Dodge, Kennecott, and Magma mining corporations. Strikes in the construction industry delayed work on schools, highways, the Glen Canyon Dam (see DAMS), and private developments. Elsewhere in economic activity, agricultural production and income exceeded totals for 1958, and industrial and commercial development continued to exceed other sector totals.

Upon action initiated by the state attorney general and the state bank superintendent, the Arizona Savings and Loan Association was placed in receivership for allegedly mismanaging depositors' funds. Final court action resolving the association's position was not expected until 1960.

Late in the year, controversy erupted in the Tucson area when the U.S. Department of the Interior withdrew some lands from the Tucson Mountain Park for private mining development purposes. Protests forced a reconsideration, however, and permission for mining was revoked in December. Controversy continued over locations of access highways to the new federal interstate highway system being developed in Arizona. Principal comment was generated by bypassed communities previously intersected by federal highways.

Among miscellaneous developments, the Central Arizona Project was reactivated to study water needs and sources—with concentration on the future use of Colorado River water; commercial jet traffic hit the state with emergency landings of Boeing 707's at Sky Harbor, Phoenix, and Tucson Municipal Airport; grand jury proceedings were initiated against Pima County officials; and the state's two major cities, Phoenix and Tucson, doubled their land areas, through annexations, to 110 and 46 square miles, respectively. At Phoenix the University of Arizona announced plans for a fine arts center and auditorium, designed by Frank Lloyd Wright (q.v.) before his death in the city on April 9, and the city's new Museum of Art was opened in mid-November.

Executive.—Chief state officers in 1959:
Governor: Orval E. Faubus (Democrat)
Lieutenant Governor: Nathan Gordon
Secretary of State: C. G. Hall
Treasurer: J. Vance Clayton
Attorney General: Bruce Bennett
Auditor: James Jones
Commissioner of Education: A. W. Ford

Constitution and Judiciary.—The present constitution went into effect in 1874. The Supreme Court comprises seven justices; chief justice in 1959 was Carleton Harris.

Legislature.—The General Assembly (Senate, 35 members; House of Representatives, 100) meets in odd-numbered years commencing the second Monday in January.

In 1959, obviously mindful of Gov. Orval Faubus' grass-roots prestige—in 1958 he carried every county in a third-term victory—the assembly enacted all but one of his school segregation proposals. These included a new pupil assignment law, upheld in federal court on September 21, which was put in use at both Little Rock and Dollarway, and a last-ditch constitutional amendment which, if approved in the 1960 referendum, would allow the voters in any integration-threatened district to close the public schools therein and divide the available funds equally among the displaced students as tuition aid. Not a single vote was cast against some of the early-year segregation bills, but by midsession a few legislators were voting nay or abstaining. In the final days a hard-core Senate minority led by the Pulaski County (Little Rock) delegation blocked a Faubus-endorsed, spur-of-the-moment plan to enlarge the then-deadlocked Little Rock School Board (see below, *Principal Events, 1959*), tabling one bill for that purpose and killing its alternate by filibuster.

The assembly also followed Faubus' lead on measures unrelated to integration, among them: an extension of the minimum (20%) assessment program; stricter insurance and securities regulations; a three-year bond authorization, subject to voter approval, which would yield up to a $21 million maximum (the measure was passed in lieu of a highway tax increase); and an untrimmed education allocation, including a slight increase for higher education (but with no taxes to insure that revenues would fulfill allocations). The assembly expressed distrust for national Democratic Party leadership by freeing the state's electors from future party loyalty.

Finance.—In the 1958–59 fiscal year, state revenue of $242,427,989.80 comprised $152,835,090.61 from state tax sources, $69,289,446.39 from the federal government, and $20,303,452.80 from all other sources. Tax revenue consisted of $50,636,623.43 from a 3% general sales tax, $8,438,575.07 from individual income taxes, $8,349,159.15 from corporate income taxes, $37,736,525.22 from motor fuel taxes, $18,475,794.88 from licensing, and $29,198,-412.86 from all other state tax sources. Expenditures of $242,721,464.83 included $57,297,861.34 for education, $59,067,357.63 for health, welfare, and safety, $56,806,-364.06 for highways, and $69,256,406.77 for all other purposes.

Banking.—As of June 10, 1959, the state's 55 national banks had assets of $620,430,000, demand deposits of $433,391,000, and time deposits of $128,141,000. The 182 state banks (June 30, 1959) had $603,550,717.37 in assets, $412,300,791.06 in demand deposits, and $131,438,-647.92 in time deposits.

Education.—School attendance is compulsory between the ages of 7 and 15, inclusive. Operating expenditures of $65,028,427 ($179.91 per pupil) for public elementary and secondary education in the 1957–58 school year included $30,563,361 from local school districts, $32,709,299 from the state, and $1,755,767 from the federal government. Outlays for construction and improvements amounted to $3,298,204, and teachers' salaries averaged $3,104 (high school, $3,294; elementary, $2,954).

ARKANSAS SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (1–6)	1,328	14,694	252,809
Public junior high (7–9)	255	4,100	98,916
Public senior high (10–12)	211	2,460	68,286
Private and parochial elementary and secondary	101	466	11,343
Junior colleges	3	89	917
Teachers colleges	2	149	2,531
Colleges and universities	15	1,253	17,979

Social Welfare.—In the 1958–59 fiscal year, federal and state funds expended for public assistance (excluding institutional costs) totaled $37,932,963.41, including $29,014,259.33 for the aged, $5,119,083.52 for dependent children, and $2,523,566 for the permanently and totally disabled. A monthly average of 73,603 persons received assistance.

Labor Force.—The state's labor force totaled 638,900 in August 1959, including 186,800 agricultural workers. Nonfarm employment reached 430,000, compared with 423,800 for the previous June and an average of 424,200 for the year between mid-1958 and mid-1959. Manufacturing accounted for 28.4% of nonfarm employment; trade for 22.2%; and government for 19.3%. Unemployment dropped substantially to 26,500 in August 1959 from 44,000 a year earlier. The state paid $10,573,199 in unemployment compensation for the year ending June 30, 1959.

Manufacturing.—The state's 3,120 manufactur-

MAJOR ARKANSAS MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.[1]
Lumber and wood products	22,435	$52,373	$76,020
Chemicals and products	5,130	24,140	72,106
Pulp, paper, and products	4,487	20,385	55,583
Primary metal industries	2,913	14,805	42,832
Furniture and fixtures	6,157	17,947	30,507
Electrical machinery	1,450	5,107	21,038
Stone, clay, glass products	2,579	9,146	20,374
Leather and leather goods	3,811	10,164	20,180

UPI

(*Left*) In a special recall election in Little Rock on May 25, moderate school board members were retained, while ardent segregationists were ousted. Here, moderates are carried in triumph in postelection celebration. (*Right*) Arkansas' Governor Orval Faubus, who had given his support to the losers, speaks at a press conference in Little Rock on May 27.

ing establishments in 1958 employed an average of 90,066 persons who received $298,193,877 in wages. Value added by manufacture (1957) totaled $640,981,000, and outlays for new plant and equipment amounted to $85,340,000. Production workers in manufacturing averaged $62.51 for an average workweek of 41.4 hours in August 1959.

Mining.—Arkansas in 1958 ranked 26th among the states in the value of mineral output, with 0.80% of the national total. It was first in bauxite (96% of domestic output), second in barite, third in bromine, and fifth in manganese production and aluminum capacity. The value of its mineral output, which was $11,908,000 under the 1957 figure, was the lowest since 1953.

ARKANSAS MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Barite	182,779	$ 1,668,000
Bauxite (long tons)	1,257,916	11,394,000
Clays	578,000	1,578,000
Coal	364,000	2,744,000
Manganese ore	22,221	1,737,000
Natural gas (1,000 cu. ft.)	32,890,000[1]	2,664,000[1]
Natural gasoline (bbl.)	885,643	2,574,000
Petroleum (bbl.)	28,700,000[1]	80,934,000[1]
Petroleum gases (bbl.)	1,274,238	2,743,000
Sand and gravel	8,644,000	7,039,000
Stone	8,461,000	10,178,000
Other minerals	...	7,264,000
Total	...	$131,603,000[2]

[1] Preliminary. [2] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 was up to $307,025,000 from $271,310,000 for the same period of 1958. For the full year 1958, income comprised $231,443,000 from livestock and livestock products, $365,048,000 from crops, and $31,448,000 from government payments. Principal livestock income sources were cattle, $80,374,000, and broilers, $70,399,000.

ARKANSAS CROP INCOME

Crop	Cash receipts 1957	1958
Corn	$ 4,139,000	$ 2,872,000
Cotton lint	159,173,000	160,447,000
Cottonseed	17,283,000	16,985,000
Oats	4,860,000	3,213,000
Peaches	2,747,000	3,740,000
Rice	53,667,000	57,676,000
Sorghum grain	2,216,000	3,116,000
Soybeans	67,205,000	90,009,000
Strawberries	1,834,000	2,974,000
Wheat	4,368,000	3,498,000

(Source: U.S. Department of Agriculture.)

The state's 145,000 farms in 1954 had a total acreage of 17,944,000 (5,536,000 acres in harvested cropland). Livestock on farms (Jan. 1, 1959) included 1,493,000 cattle and 5,056,000 chickens (excluding commercial broilers). During the week of Oct. 18–24, 1959, 314,000 family and hired workers were engaged in farming.

Transportation and Communications.—State and federal funds spent for highways in the 1958–59 fiscal year totaled $56 million, and 502 miles of new construction were completed.

Highways and roads on Jan. 1, 1959, totaled 74,272 miles, including 11,023 miles of state highways, 56,740 miles of county roads, 4,874 miles of city streets, and 1,653 miles of state park, forest, and reservation roads. Of the total, 12,365 miles were surfaced. Registered *motor vehicles* numbered 673,666 on Dec. 31, 1958, including 440,619 passenger cars. There were (1959) 30 *railroads* operating 4,368 line miles; 6 regularly scheduled *airlines;* and 100 *airports and airfields* (13 commercial and municipal, 4 military, and 83 private).

Communications media (1959) included 62 *radio stations;* 6 VHF *television stations;* 31 daily *newspapers* (circulation, 231,000) and 139 other newspapers (211,443); and (January 1) 114,400 business and 268,000 residential *telephones.*

Principal Events, 1959.—Attention continued to focus on Little Rock, where a maze of events led to the August reopening of the public high schools with minimum integration. The year began there amid a legal snarl: the high schools remained closed under a state segregation law, a pre-existing federal court order called for an immediate start on gradual integration, and a newly elected School Board was split 3–3 over how to deal with the dilemma. During the nearly six-month wait while the courts reviewed the school-closing law, local moderates and segregationists fought for control of the deadlocked board. The segregationists almost broke the deadlock in early March, failing by the barest of margins to enlist General Assembly intervention in their favor (see above, *Legislature*).

The showdown in the board fight came in May over contract renewal for studentless high school teachers. After the moderates quit a board session, the segregationists fired 44 out of some 200 high school personnel without a hearing. This alleged "teacher purge" sparked massive public action, the moderate citizenry grouping under the STOP banner (Stop This Outrageous Purge) to file petitions for recall of the three segregationists, and their opponents organizing the CROSS (Committee to Retain Our Segregated Schools) which filed similar petitions against the three moderate board members. Despite Governor Faubus' 11th-hour support of CROSS, a heavy vote on May 25 resulted in the ousting of the segregationist trio and the retention of the moderates, both issues being decided by narrow margins. The Pulaski County

Board of Education then filled the vacancies, placing the board under solid moderate control.

On June 18, a federal court threw out the 1958 school-closing law, and the next day the board announced plans to reopen the high schools under the pre-existing order that they be integrated. Of 55 Negroes seeking to enroll in once-white high schools, only six were so assigned under a new student placement law (see above, *Legislature*), three each to Central and Hall High schools, but none to Technical High. In a surprise move the board advanced the school opening date to August 12, possibly to forestall the calling of a special session of the General Assembly. On the day the desegregated schools reopened, an estimated 250 jeering demonstrators attempting to break city police lines around Central High were dispersed by local firemen and policemen armed with water hoses and nightsticks. In the disturbance, considerably milder than the violence attending the opening of Central High in 1957, 21 citizens were arrested on minor charges, but none had been tried by late in the year. School officials reported no major student disorders as classes began on schedule. Within a few weeks, all private and church-sponsored schools, established in 1958 to educate white students, were disbanded. (See also EDUCATION.)

The uneasy calm which followed was disrupted on the night of September 7, when dynamite blasts ripped the fire chief's auto, the city mayor's private business office, and the School Board building—none occupied at the moment. Public indignation flared and Governor Faubus termed the incidents "sickening and deplorable." Within days, the Little Rock police arrested and arraigned five local citizens. Of the five, one confessed to a part in the bombing and began serving a five-year state prison term and three others were found guilty by juries which each recommended three-year sentences. The trial for the other defendant was on docket. Sworn testimony charged Ku Klux Klan inspiration for the bombings.

Also in Little Rock, on June 17, a federal grand jury found, after a detailed probe, "no cause for indictment" in connection with segregationist Dr. Dale Alford's 1958 "write-in" congressional victory over moderate Brooks Hays, veteran congressman and Democratic nominee. Hays subsequently accepted an Eisenhower appointment to the Board of Directors of the Tennessee Valley Authority.

At Hoxie in northeastern Arkansas, voters refused to recall two School Board members under fire mainly for having helped desegregate the Hoxie schools in 1955 (in the fall of 1959 eight Negroes were enrolled in grades 1-12). At Dollarway, outside Pine Bluff, a district in which the races are about evenly balanced, the petition of three Negroes to enroll in the all-white high school caused civil unrest and a delay in the fall opening. The U.S. Court of Appeals for the 8th Circuit upheld the Dollarway board in assigning the petitioners to the local all-Negro school under the 1959 student placement law, clearing the way for a segregated opening on September 25.

Elsewhere in the state in 1959 the Ark-La Gas Company began operation of a several million-dollar cement plant in Little River County, and work began on a Mississippi River bridge at Helena.

Legislature and Principal Events by:

Southern State College, Arkansas.

ARMED FORCES. See AIR FORCE, U.S.; ARMY OF THE U.S.; MARINE CORPS, U.S.; NATIONAL GUARD; NATIONAL SECURITY; NAVY, U.S.; and the Index entry, *Armed Forces.*

ARMY OF THE UNITED STATES. The principal missions assigned to the Army in 1959 were: (1) to maintain forces overseas for the deterrence of aggression or for effective resistance to aggression if deterrence fails; (2) to maintain mobile, combat-ready strategic forces at home for the rapid reinforcement of deployed forces overseas, and to come to the aid of allies in areas where no United States forces are now deployed; (3) to provide forces as required for the defense against possible air and missile attack; and (4) to maintain a basis for rapid mobilization, including strong combat-ready civilian components.

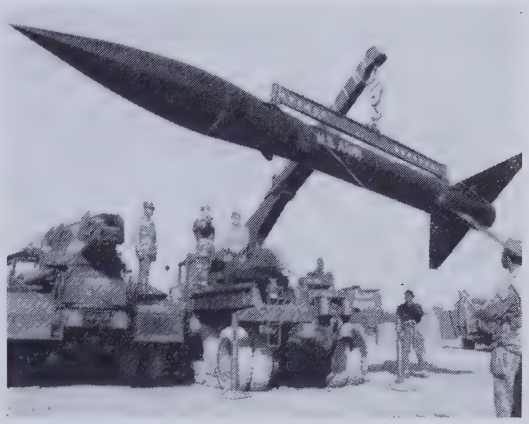
Personnel and Strength.—Important personnel appointments in 1959 included those of Dewey Short as assistant secretary of the Army for manpower, personnel, and reserve forces; Gen. Lyman L. Lemnitzer as chief of staff of the Army; Gen. George H. Decker as vice chief of staff; Gen. Carter B. Magruder as commander in chief, United Nations Command, and commander of the Eighth Army in the Far East; and Gen. James E. Moore as chief of staff of Supreme Headquarters, Allied Powers, Europe (SHAPE), replacing Gen. C. V. R. Schuyler, who retired. Gen. Maxwell D. Taylor, former chief of staff, and Dr. William H. Martin, director of research and development, retired in 1959. Dr. Martin was succeeded by Richard S. Morse. Gen. Clyde D. Eddleman, former commanding general of the U.S. Seventh Army, succeeded retiring Gen. Henry I. Hodes as commander in chief, U.S. Army, Europe (USAREUR), and commanding general of the NATO Central Army Group. Gen. Charles D. Palmer replaced his brother, Gen. Williston D. Palmer, as deputy commander in chief of the United States European command. Gen. Williston D. Palmer, retired, has been designated as director of military assistance, Office of the Assistant Secretary of Defense.

The Army was directed to effect a reduction from an authorized strength of 900,000 officers and men as of June 30, 1958, to a strength of 870,000 by June 30, 1959. This loss necessitated a reduction in combat units and logistical, administrative, and service support.

New Assignment Procedures.—A more effective method has been introduced into the Army for identifying and assigning recruits with "rare and unusual" qualifications, as well as those possessing high aptitude area scores. As set forth in new regulations, a screening procedure carried on at reception stations or in training activities provides for identification and reporting of such personnel by name, thus assuring that proper consideration is given special talents in determining assignments after basic combat training.

The military services reached agreement as to the uniform lengths of foreign duty tours in more than 100 overseas areas. The 13-month tour in Korea represents a reduction of the time formerly required of Army personnel in that area, and is regarded as a step toward minimizing hardships of overseas service. In general, the standard pattern calls for 36-month service for servicemen accompanied by dependents in more favorable areas, and 24 months for those not so accompanied. In areas where living conditions are less favorable, tours of shorter duration have been established.

Operations and Training.—Within the continental United States, the major portion of resources available for field exercises was utilized in maneuvers designed to improve the readiness of the Strategic Army Corps (STRAC). Such exercises and maneuvers have permitted evaluation of new divisional



U.S. ARMY

(*Left*) Within a 500-yard range, U.S. Army's new 90-millimeter recoilless rifle, fired from the shoulder by a two-man team, has the delivery power of a medium-size tank gun. (*Right*) At a base in Italy, U.S. Army personnel, under U.S. military assistance program to NATO allies, instruct Italian soldiers in operating the Honest John surface-to-surface missile. NATO's plans call for the establishment of 100 missile batallions by 1963, with other bases in Britain, Scandinavia, and Turkey.

and other organizations, and the experience gained has been instrumental in developing modifications.

Fast air movement in February 1959 of a reinforced battle group of 1,100 STRAC paratroops from North Carolina to Panama demonstrated the capability of reinforcing overseas assault areas from the United States.

All of the reserve component combat divisions were converted to the new organizational structure which had been approved for Active Army forces in order to meet the requirements of the modern battlefield.

Nike missile sites manned by National Guard battalions were established in 1959 as active parts of the air defenses of Los Angeles and Seattle. Two Lacrosse surface-to-surface missile battalions and one battalion for the operation of the Hawk missile were activated.

Logistics.—A major effort has been devoted to training at the individual and unit levels and to the development of technical knowledge and professional skill through specialized military education. Steps toward modernization of the United States ground forces were taken in procuring equipment to modernize the Army. New tables of organization and equipment were established to provide the foundation upon which to base specific logistical planning. New M-60 machine guns were acquired. Project Elimex (eliminating useless stocks) was successfully concluded and continuing elimination standards were implemented. An improved supply system for fast-moving supply items and repair parts was established as a result of the experimental Project MASS (Modern Army Supply System).

As a long-range solution to many new strategic requirements, plans were initiated for a radically advanced communications system known as the Universal Integrated Communications System (UNICOM). This system permits both a saving of time and deferred service by means of automatic switching centers, and markedly increases speed, security, and accuracy through extensive automation. Its other features include a high degree of standardization in signaling rates; integral electronic data processing; and improved trunking means and multimode operation of voice, teletypewriter, digital data, facsimile, and video signals.

The successful space flight in 1959 of the Army's monkey, Able, and the Navy's monkey, Baker, as passengers in the nose cone of the Army's Jupiter missile, resulted in advances in space medical research. (See also SPACE FLIGHT—*Space Medicine.*)

Research and Development.—In weapons development the trends are toward a reduced number of types of artillery, a dual nuclear and nonnuclear capability in principal weapons, an increase in mobility of weapons through weight reduction and adaptability to air transportability, and a search for highly effective area weapons which fill the gap between conventional artillery and currently available nuclear weapons. Within the limitations of security, some of the principal accomplishments can be revealed as follows: (1) a new small arms family; (2) a directional anti-personnel fragmentation weapon; (3) a new grenade launcher; (4) a light, accurate, antitank assault rocket grenade; (5) the 90-millimeter recoilless rifle; and (6) new armored vehicles.

Some of the new developments which will have wide impact for tomorrow's Army range from personal equipment to entire new weapons systems. They include new portable radar sets, forward-area voice radio sets, an air transportable armored personnel carrier, the utility helicopter HU-1 Iroquois, missiles, self-propelled field artillery, foods, and personal equipment. (See also AERONAUTICS; MISSILES.)

Reserve Components.—A vital facet of the Army's activities for the performance of its mission is the maintenance of trained combat-ready reserve components capable of prompt provision of qualified units and individuals, either to help meet the requirements of a general war or to replace units of the STRAC when it is deployed overseas in an emergency. These requirements are met by the Army National Guard and the U.S. Army Reserve. Army reserve forces considered to be immediately available for mobilization are contained in the Ready Reserve, which has an authorized strength of 1,448,000 officers and men. A total of 700,000 personnel are assigned to units in a paid drill status, and 748,000 are listed as individual reinforcements. The unit strength of the former consists of 400,000 National Guardsmen and 300,000 Army Reservists. On mobilization, about 1,100,000 of the total 1,448,000 Ready Reservists would be required by the combat divisions and supporting units in the Army Reserve Forces Troop Basis. The balance would be required as individual reinforcements for Active Army units and for the initial organization of additional units.

Budget and Expenditures.—Funds appropriated for the Army for the fiscal year 1960 (Public Law 86–166, signed by President Eisenhower on Aug. 18, 1959) totaled $9,375,805,000. This amount did not include construction funds for the Active Army, the Army National Guard, and the Army Reserve, which aggregated $307,011,300 (Public Law 86–275, signed Sept. 16, 1959), and the amount of $281,000,000 transferred from the Army Stock Fund.

Operation and maintenance funds available in the fiscal year 1960 are less than those for the fiscal year 1959. Restrictions on obligations and expenditures were enforced

throughout the fiscal year 1959. Continuation of these restrictions as applied to fiscal 1960 appropriations will require the Army to extend its managerial abilities in order to accomplish its principal missions.

ARTHRITIS. The arthritic and related rheumatic diseases continue to be among the most common of the chronic diseases and of the causes of prolonged disability. The ever-increasing interest in the problems associated with arthritic and related diseases was reflected during 1959 in a number of national and international scientific meetings and in the formation of voluntary health agencies to combat these diseases in Argentina and India. In the United States, close cooperation continued to exist between the three major agencies in this field —the American Rheumatism Association, a professional organization; the Arthritis and Rheumatism Foundation; and the National Institute of Arthritis and Metabolic Diseases of the U.S. Public Health Service.

Methods of treatment not substantiated by sound clinical trial continue to be promoted through newspapers and magazines. As a result, arthritic sufferers in the United States spend over $245 million a year seeking relief from devices and other products which are misrepresented in advertisements.

Rheumatoid Arthritis.—In spite of the intensive clinical and basic research being conducted, definitive knowledge of the etiology, prognosis, or cure of this disease is still lacking. Two conferences held during 1959 defined possible new avenues of research through studying certain naturally occurring rheumatic diseases in animals, and from a re-evaluation of the patient's bodily response to the disease. Rheumatoid arthritis was shown to be indigenous to all populations throughout the world, although the need for prevalence studies was indicated in some areas such as Africa.

The basic treatment regimen of salicylates, rest, and simple exercise remained unchanged. Adrenocortical steroids are indicated in selected cases. Dexamethasone became generally available in 1959; and apart from the much smaller equivalent dose, its actions and adverse side effects were similar to those of the other adrenocortical steroid compounds. The antimalarial compounds, such as chloroquine, while widely used, were still of questionable value in the long-term treatment of rheumatoid arthritis. The American Rheumatism Association initiated a program of cooperative clinics throughout the United States whereby eventually an evaluation of a particular treatment could be determined. Interest in reconstructive surgery, particularly of the hands and feet, continued to mount.

Great strides were made in the purification of the "rheumatoid factor"—a protein substance found in the blood of patients with rheumatoid arthritis. This factor, it is now believed, is the result of the disease and plays no part in its cause. The very useful diagnostic tests based on its detection continued to be modified and improved. Much knowledge of the composition and physiology of the diffuse connective tissue system which appears to be the prime target of most of the rheumatic diseases continues to be gained. Important information on changes occurring with aging was announced. Increasing attention also is being paid to the psychosocial aspects in studying and treating rheumatoid arthritis and related diseases.

Evidence accumulated that rheumatoid spondylitis was a separate disease entity and not just a variant of rheumatoid arthritis. The peculiar association between this disease and certain forms of cardiac disease was re-emphasized. The kidney lesions of systemic lupus erythematosus received considerable attention, as did the elucidation of the specific blood reactions and their relationship to rheumatoid arthritis.

Rheumatic Fever.—Prompt treatment of streptococcal infections with such antibiotics as penicillin has been shown to prevent rheumatic fever. Recurrences of the disease are controlled by continuous administration of prophylactic agents, the most efficacious being injections of long-acting penicillin at monthly intervals. In spite of this control, rheumatic fever and its most serious complication—rheumatic heart disease—continue to present a problem. The exact role of the streptococcus in the etiology of rheumatic fever is still not fully known. Although long suspected, Sydenham's chorea, a manifestation of this rheumatic disease, was finally shown to be associated with a streptococcal infection, the onset of which could have occurred up to six months earlier.

In the treatment of acute rheumatic fever, bed rest and adequate salicylate therapy are still fundamental. The role of the adrenocortical steroids in treatment is still controversial. They can, however, be invaluable in severe cases, especially those with heart involvement.

Osteoarthritis.—This condition, caused by degeneration of the cartilage and secondary overgrowth of bone, is widespread not only in man but also in wild and domestic animals. It has been disclosed that the disease in cattle and horses has caused tremendous economic loss. A better understanding of the development of this condition as a result of trauma, aging, and hereditary and metabolic changes is emerging as a result of animal, laboratory, and clinical research. Ochronosis, a disease causing severe osteoarthritis as a result of the deposition of a black pigment in cartilage, has been shown to be due to the absence of a specific enzyme in the liver. Good results have been reported with surgery in those with severe disabling arthritis of the hips, by using replacement prothesis or a type of extended sympathetic denervation.

Gout and Gouty Arthritis.—Primary gout is caused by an inheritable peculiarity in the metabolism of uric acid, while secondary gout may arise as a result of disorders of the blood-forming system. While primary gout is much more common in males, the secondary form occurs more often in females. Although the metabolic abnormalities in this disease are gradually being revealed, the cause of acute attacks is still not known.

In the treatment of acute attacks, colchicine, phenylbutazone, and adrenocortical steroids are judiciously used. Rigid dietary restrictions, except in severe tophaceous cases, are not now considered necessary. In chronic cases with excessive uric acid accumulations, medications which increase urinary excretion of uric acid are used. For this purpose two new compounds, sulfinpyrazone and zoxazolamine, have been made available, in addition to probenicimide. Gout is one of the few rheumatic diseases which can be adequately controlled and late complications avoided with available methods of treatment.

Rehabilitation.—Evidence continues to be presented from many countries concerning the effectiveness of rehabilitation programs in returning incapacitated patients to a more self-sufficient state. The retraining of arthritic patients to return to gainful employment has been found to be a practicable and rewarding undertaking.

ASBESTOS. See MINERAL PRODUCTION.

ASCENSION. See SAINT HELENA.

ASIA. A continent of the Eastern Hemisphere. Estimated area (including Turkey but excluding USSR), 10,479,500 square miles; pop. (est. 1958),

1,592 million (excluding USSR). See also FAR EAST; articles on the countries of Asia; and the Index entry, *Asia*.

ASPHALT. The West Indies federation island of Trinidad provides the major part of the world's supply of natural asphalt. The United States also produces large quantities of asphalt and asphaltic products. Sales of bituminous limestone increased 15%, from 1,135,000 short tons in 1957 to 1,306,000 in 1958. Bituminous sandstone sales decreased from 34,000 short tons in 1957 to 21,000 short tons in 1958. Bituminous limestone was mined in Alabama, Oklahoma, and Texas; sandstone, in Missouri and Oklahoma. Sales of gilsonite, mined in Utah, were 317,000 tons in 1958, compared with 206,000 tons in 1957. Asphalt, cement, and fluxes accounted for 70% of total domestic sales.

Imports of solid petroleum asphalts increased by 26%, from 744,000 tons (revised) in 1957 to 939,000 tons in 1958. Imports of liquid petroleum asphalt decreased from 447,000 tons (revised) in 1957 to 419,000 tons in 1958. Shipments from Venezuela amounted to 97% of the total.

Sales of petroleum asphalt paving products totaled 13,383,850 tons in 1958; sales of roofing products, 3,101,187 tons; and sales of all other products, 1,694,062 tons. Sales of road oil totaled 1,164,976 tons.

ASTRONAUTICS. See NATIONAL AERONAUTICS AND SPACE ADMINISTRATION; SPACE FLIGHT.

ASTRONOMY. Although the Soviet Union's launching of two rockets to the moon in late 1959 provided the year's most spectacular developments (see SPACE FLIGHT), important progress was made also in other investigations of our universe.

Aided by the artificial satellites and the vast amount of data collected during the International Geophysical Year (IGY), scientists concentrated on the solar system in 1959. The bodies currently under intensive study are the earth, the sun, Mars, and to a lesser extent, Venus and Jupiter. New knowledge concerning meteors and interplanetary dust, charged particles from the sun, and magnetic fields in space is becoming increasingly important in these studies.

Solar Flares.—It has long been known that sunspot frequency, auroral activity, disturbances of the geomagnetic field, and related phenomena follow the 11-year sunspot cycle. Now it has been learned that radio transmission is affected by the state of the upper atmosphere. While some of the atmospheric effects are regular (diurnal or seasonal), others are irregular and are connected with events on the sun. For example, on May 10, 1959, at 21:02 Universal time, a great solar flare—one of the largest and brightest ever observed—occurred in the northeast quadrant, near a group of spots; peaks of intensity were reached 16 and 38 minutes later. Simultaneously with this eruption, there occurred a sudden increase in cosmic and atmospheric noise absorption, and, a little later, major outbursts of solar noise. A magnetic storm which began on May 11 and continued until May 13 was probably induced by the flare. There is now evidence that solar flares may also occasionally produce effects on the dark side of the earth. (See also METEOROLOGY AND CLIMATOLOGY.)

The Naval Research Laboratory, using rockets at heights of 130 to 150 miles, has proved that streams of X-rays pour out from the sun during solar flares. Their immense energies indicate local temperatures of over 100,000,000°C. in the solar atmosphere, many times higher than previous estimates.

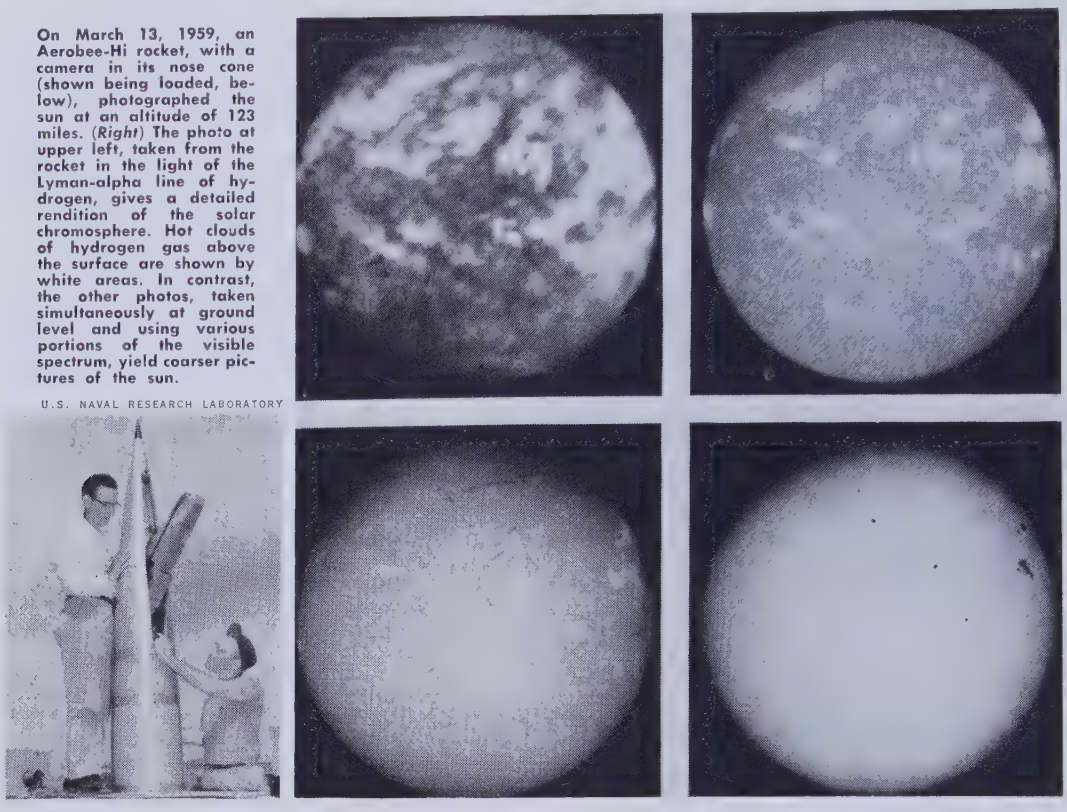
Interplanetary Gas.—Theories as to what, if anything, fills the space between the planets have been revised considerably in recent years. Besides the meteoroid particles of all sizes in outer space, there is the low-density interplanetary gas where electrons are most effective in contributing to the zodiacal light. The sun seems to be the source of this gas; we know that violent eruptions take place there, and we may assume that a slow, rather constant outflow of gas emanates from its surface. The planets add the molecules which escape from the outer regions of their atmospheres but which are still contained by solar attraction. This material generally moves as the planets and near the plane of the ecliptic. New knowledge indicates that interplanetary gas may be considered largely as part of the solar atmosphere, which extends at least beyond the earth's orbit.

It has long been observed that some coronal streamers extend out many solar radii from the sun, and it has more recently been calculated that at some 40,000 kilometers above the surface (1 kilometer = 0.62137 mile) the coronal temperature is about 1,000,000°K. Additional data on conditions as far from the sun as 20 solar radii have now been obtained, and these confirm the hypothesis that even at the distance of the earth (but along the sun's rotation axis, at right angles to the plane of the earth's orbit) the gas may still be as high as 100,000°K. At the same point in the solar atmosphere, the density of this gas would be perhaps about 3,000 electrons and 3,000 protons per cubic inch. Hence, the earth and perhaps some planets farther from the sun move through a dust-laden solar atmosphere of high temperature and low density. The retarding effect would be negligible for planets, but may affect comets, particularly their tails.

The earth's atmosphere may be considered to end where its density has declined to that of the surrounding solar atmosphere, which itself may be said to end where its density has decreased to that of interstellar gas. According to one theory, the earth's atmosphere may extend as far as the moon, but the boundaries of neither the earth's nor the sun's atmosphere are known at present. There is continuous interaction between the two atmospheres, however, and the earth's temperature probably is affected by the hot solar gas which flows down into the atmosphere below the F_2 layer of the ionosphere. Heat in our atmosphere is also contributed by the zones of radiation which encircle the earth (whose energy is supplied by cosmic rays and streams of ionized gas from the sun), and by the energy of sunlight absorbed in the upper atmosphere. Because the temperature gradients above and below the peak ion density of the F_2 layer are not precisely known, we cannot tell the amount of heat supplied by each of these sources, although rockets and satellites may soon provide the answer. Above 80 km., the temperature increases until it reaches that of the solar gas, which may be a point 300,000 miles from the earth, or beyond the distance of the moon. The temperature gradient, which rises several degrees per mile of altitude in the F_2 layer, decreases to one degree or less at a height of one earth radius, and continues to fall at higher altitudes.[1] (See also ATMOSPHERE RESEARCH.)

Photographing the Moon.—The first photographs

[1] The foregoing discussion is in part based on the article, "The Earth and Its Environments," by Sydney Chapman, in *Proceedings of the IRE*, vol. 47, no. 2, February 1959.



On March 13, 1959, an Aerobee-Hi rocket, with a camera in its nose cone (shown being loaded, below), photographed the sun at an altitude of 123 miles. (*Right*) The photo at upper left, taken from the rocket in the light of the Lyman-alpha line of hydrogen, gives a detailed rendition of the solar chromosphere. Hot clouds of hydrogen gas above the surface are shown by white areas. In contrast, the other photos, taken simultaneously at ground level and using various portions of the visible spectrum, yield coarser pictures of the sun.

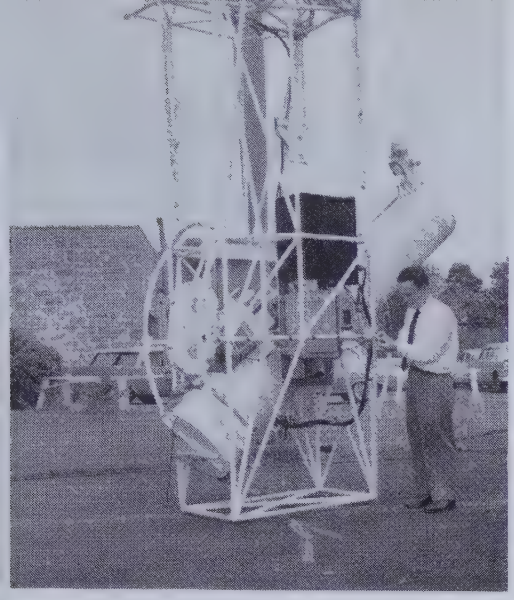
U.S. NAVAL RESEARCH LABORATORY

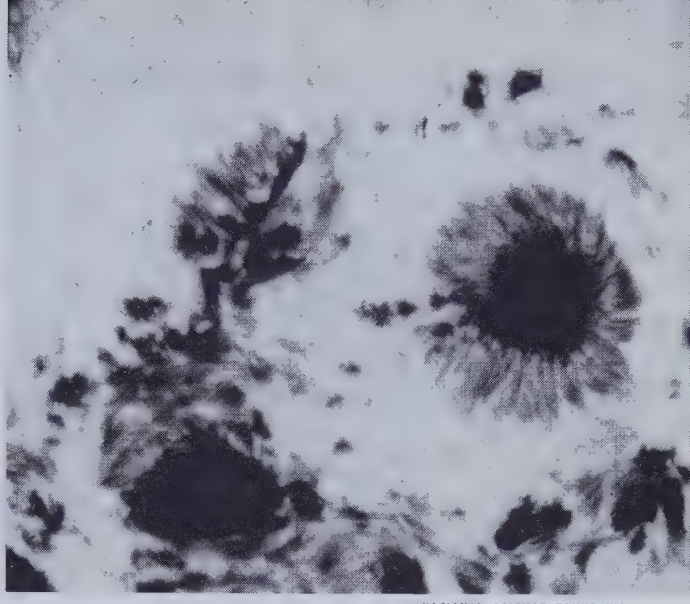
ever made of the nether, or far, side of the moon were taken by the Soviet Union's third moon rocket on Oct. 7, 1959. The 614-pound vehicle, launched on October 4 into an elliptical orbit around the earth and the moon, was reported by the USSR to have passed 4,906 miles below the moon's southern pole and then swung slightly to the north in response to lunar gravity. At a point about 260,000 miles from earth, the rocket's two cameras (with 200-mm. and 500-mm. lenses) were aimed at the moon by a signal from the Soviet Union. Photographs of the surface were made on 35-mm. film from about 37,000 to 43,000 miles distant. The film was then developed, fixed, and dried, and the pictures transmitted by an electronic scanning device, beginning at 274,000 miles from earth.

About 70% of the moon's far side (mostly in the northern hemisphere) was covered in the photograph released by the USSR on October 27. The surface in the picture seemed to be largely free of the deserts, craters, and mountains which mark the side of the moon turned toward earth. Some of the features were extensions of markings already visible from earth. The Russians gave names to seven of the dark spots not seen before, including the Sea of Moscow, a lava- or dust-filled depression 187 miles across, located in the center of a vast white section. The fact that the sun was at its zenith when the photos were made, and thus produced no shadows, accounted in part for the comparatively monotonous character of the surface. More detailed photographs are needed before the apparent difference between the near and far sides can be explained or fully confirmed. (See illustrations under SPACE FLIGHT.)

Photographing the Sun.—Further progress in solar study was privided in 1959 by high-altitude balloon flights. Project Stratoscope I, begun in 1957, was resumed in the summer of 1959 with three flights of a balloon-borne 12-inch solar telescope to about 80,000 feet. Refinements in the later series, conducted over Minneapolis, Minn., included the use of a closed-circuit television link and remote control guidance of the telescope. Photographs taken at this height are free of much of the obscuration of the earth's atmosphere, and in 1959 provided excellent views of sunspots. The project is sponsored by the National Science Foundation and the Office of Naval Research. Another milestone in scientific investigation of the sun was reached on March 13, 1959, when a Navy Aerobee-Hi rocket was fired 123 miles over White Sands (N.Mex.) Proving Ground. The launching produced the first detailed photos of the sun taken in the light of the Lyman-alpha line of hydrogen, revealing the hydrogen gas clouds which, because they emit ultraviolet light, are not visible through the screening layers of the ionosphere. (See also ELECTRICAL DEVELOPMENTS.)

Venus.—A very rare event was the occultation of the first-magnitude star Regulus by the planet Venus on July 7, 1959. In an occultation of this type, the star gradually disappears behind denser and denser layers of the planet's atmosphere. The July occultation was considered of great importance because it offered astronomers an opportunity to learn more about Venus. The phenomenon was observed from Europe, Asia, and Africa, and photographic, photometric, micrometrical, and motion picture observations were made. The planet's apparent diameter was 28".3 (seconds of arc) and, as viewed at Madrid, Spain, required about 11 minutes to cross the star. Preliminary data indicate that the density of Venus' atmosphere decreases outward tenfold every 14 km. The region probed was estimated to be from 100 to 150 km. above the planet's surface, or about 100 km.





NATIONAL SCIENCE FOUNDATION

The black box houses telemetry and remote-control mechanisms, with TV transmitting equipment below. (*Right*) Photograph of sunspots, taken with Stratoscope equipment at 80,000 feet.

above the permanent cloud layer. The composition of the atmosphere of Venus remains a matter of controversy, although there is evidence that it contains much carbon dioxide. Temperature measurements vary widely, and there is no unity of estimates as to the rotation period, although it is probably more than 14 days.

Evidence of water vapor in Venus' atmosphere was detected for the first time in 1959. In a balloon which rose near Rapid City, S.Dak., and reached a height of 81,000 feet before landing the next day (November 28), Navy Comdr. Malcolm Ross and Dr. Charles B. Moore took spectroscopic readings of the planet's light by using a 16-inch telescope and other instruments. The amount of water vapor found was not determined immediately, but the discovery lent support to the theory that some form of life may exist there. Terrestrial observers have always been thwarted in searching for water vapor on Venus because of the earth's atmosphere, but the balloon gathered its data above an estimated 98% of the water in our air.

Studies of Venus made at the Lincoln Laboratory of the Massachusetts Institute of Technology in 1958 were published in 1959. Radio waves were sent to the planet and reflected back on February 10 and 12. (The uncertainty in transmission time was only ±0.0005.) Signals received on the second day were nearly 7.5 seconds later in returning to earth than on the first because the two planets had moved 696,640 miles farther apart in the two-day interval. Further radio studies of Venus were continued in 1959. This method of observation promises to furnish new and more accurate distances for bodies in the solar system. (See also PHYSICS.)

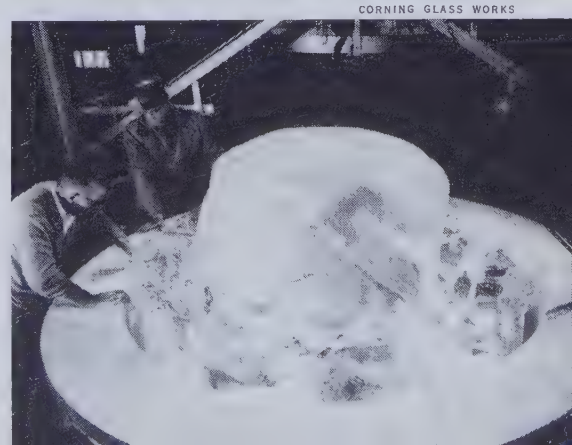
Mars.—This planet has been intensively observed in recent years, and a résumé has appeared of results obtained at Pic du Midi Observatory in France. Visual and photographic observations of Mars were compared and the polarization of 60 regions on the planet was determined. The latter confirms seasonal variations of the dark regions, the appearance of morning fogs, light yellow clouds in various places, and the evolution of the winter cloud over the poles. A superb map, based on selected photographs combined with visual observations, was drawn and reproduced. Telescopic powers up to 1,200 were used, and objects only 0".2 apart (35 miles) were separated.

The structure of the dark regions of Mars was found to be generally granular: small spots with less pronounced intervals. At the beginning of southern summer, very vivid colors, varying from region to region, were seen, but by midsummer these became more uniform. Important changes were noted in one region, and two brilliant spots also appeared. Some markings were certainly double, but "canals" as such seemed to be combinations of small spots arranged approximately in lines. Each polar cap, upon melting, seemed responsible for seasonal changes not only in its own hemisphere but also to 25° of latitude in the opposite hemisphere. We infer that these observations lend support to the hypothesis that some sort of vegetation exists on Mars.

Comets.—Comet Slaughter-Burnham (1959a) was discovered at Lowell Observatory, Flagstaff, Ariz., on January 27 on a plate taken Dec. 10, 1958, when its magnitude was 16. It has an elliptical orbit of low inclination and a period of 11.63 years. Comet 1959d, of magnitude 8, was discovered by Michiel J. Bester and Cuno Hoffmeister on July 26. When found it was in the southern part of Sagittarius, and its motion took it rapidly farther south. Comet 1959e, with a magnitude of 10, was discovered by George Alcock in England on August 25. It had a diffuse central condensation, and was in Corona Borealis. It passed

Chunks of glass weighing almost 4,000 pounds are melted to make the 84-inch mirror for the new telescope at the Kitt Peak National Observatory, near Tucson, Ariz.

CORNING GLASS WORKS



perihelion on August 18 at 1.14 A.U. Within a week, on August 30, Alcock discovered a second comet, 1959f, in the constellation Cancer. It was of magnitude 5 on September 4 and passed its perihelion point of 0.165 A.U. on September 15. By November, however, it had unexpectedly disappeared.

Comet Arend (1951k) was rediscovered by Elizabeth Roemer on July 6 at the U.S. Naval Observatory Station. It was diffuse, with a magnitude of 19. Comet Giacobini-Zinner (first discovered in 1909) was rediscovered by Dr. Roemer at the same observatory on a plate taken May 8, and it was sighted visually on July 4. Its magnitude by June 6 was about 18.7. This comet is the one which furnishes the Draconid meteors of October 9. Perturbations have shifted the comet's orbit slightly farther from that of the earth.

Eclipses.—There were three eclipses in 1959, two solar and one lunar; also on September 16/17 there was a penumbral lunar eclipse, visible in the eastern half of the United States, which might be counted as a fourth. The other eclipses were a partial lunar eclipse on March 24, invisible in the United States; an annular solar eclipse on April 8, the path crossing Australia; and a total solar eclipse on October 2, the path of totality starting just after sunrise in southern New Hampshire, crossing through northeastern Massachusetts near Boston, and continuing across the Atlantic Ocean and Africa to the Indian Ocean. For the United States, the October 2 eclipse came under poor viewing conditions, as totality occurred with the sun so very low and with only a small area of seacoast available for observation parties. Moreover, cloudy skies in Massachusetts prevented viewing from the ground, but better success was had in the Canary Islands and in airborne observations. Excellent photographs of the April 8 eclipse were obtained at several stations in Australia. As the moon was at apogee, the annular phase lasted longer than usual.

Sidereal Universe.—One important advance in sidereal astronomy was the publication in 1959 of superb photographs in natural color of nebulae and certain galactic regions. The plates were taken by William C. Miller at Mount Wilson and Palomar Observatories, many of them with the 200-inch Hale reflector. For the first time one can see at a glance the marvelous combinations of colors in these objects.

Work continues on defining the shapes, positions, and dimensions of the spiral arms of our galaxy. The use of the 21-cm. line of neutral hydrogen, using radio telescopes for observation, is proceeding most successfully. Since it was determined that there are various kinds of Cepheid variables, the use of these pulsating stars as a zero point for determining cosmic distances has been revised. While we know certainly that the older values derived were too small, authorities differ at present and much more work is needed before agreement can be reached on new values. The formerly published distances of other galaxies have been drastically revised upward by this development.

Novae and Supernovae.—Several novae were reported in 1959, two of them found belatedly on old plates. Cuno Hoffmeister thus discovered Nova Chamaeleontis of April 10, 1953, then of 7.3 magnitude. Allen Sandage found a supernova on a plate of the galaxy NGC 23, taken on Oct. 23, 1955. Invisible on a plate taken 61 days earlier, its absolute magnitude at maximum was −18, or about 1.6 billion times brighter than the sun. M. L. Humason, of Mount Wilson and Palomar Observatories, found a supernova of magnitude 12 in the galaxy NGC 7331 on June 28, 1959. On the same date he also discovered a supernova in a very small, faint galaxy at right ascension 13^h09^m, declination −3°40′, whose brightness was two magnitudes greater than that of the galaxy itself. Humason and Howard S. Gates of the Palomar staff found four supernovae in all through October 1959.

W. J. Luyten and Guillermo Haro, at Palomar, found a new-type star, perhaps "a dwarf nova which catastrophically collapsed into a neutron star." Luyten also found 16 more probably white dwarfs. Quite a long list of so-called flare stars is now available. The flares which cause their sudden brightness probably resemble those observed on the sun, but on an immensely greater scale.

Observatories.—The world's second largest optical telescope was dedicated in ceremonies on July 16, 1959, at the University of California's Lick Observatory. The 120-inch reflector, exceeded only by the 200-inch mirror at Mount Palomar, was placed in operation in the fall. The 84-inch glass disk for the Kitt Peak observatory in southern Arizona was cast early in 1959 and, after seven months of cooling, sent to Tucson, Ariz., for lengthy grinding and polishing. When completed, the huge mirror is expected to measure slightly over 80 inches in diameter, and will serve as the primary reflector at the National Astronomical Observatory, near Tucson.

Plans to build an observatory near Santiago, Chile, were announced by the sponsors, the University of Chicago, the University of Texas, and the University of Chile. The new telescope will permit study of the skies of the Southern Hemisphere, a region of the universe which has not been sufficiently observed. In Japan, work was begun on the new Okayama Astrophysical Observatory, the first of its kind in that country. Two reflectors, one of 74 inches and the other of 36 inches, will be installed in 1960.

Increasing attention is being devoted throughout the world to the use of radio astronomy for probing vast distances into space. The largest steerable radio telescope in the world is being constructed at the Naval Radio Research Station, Sugar Grove, W.Va., at a cost of $79,000,000. Due for completion in 1962, the facility will have a 600-foot saucer-shaped dish from which will protrude a 100-foot antenna. Plans for an even larger telescope to be built in Puerto Rico were announced by the Defense Department. The saucer-shaped antenna, of the fixed type, will be 1,000 feet in diameter, and will be used to study the earth's atmosphere as well as the solar system. (The largest radio telescopes at present are the 250-inch reflector at Jodrell Bank in England and a 345-foot transit type at Pulkovo Observatory in the Soviet Union.) Thirty miles from the colossal Navy structure, a 140-foot radio telescope is being completed at the National Radio Astronomy Observatory at Green Bank, W.Va. It will supplement an 85-foot steerable paraboloid antenna which began operating in July 1959.

Construction was begun in 1959 on a 210-inch steerable paraboloid antenna for the Radiophysics Laboratory at Sydney, Australia. Due for completion early in 1961, the telescope is expected to be superior in reflecting surface accuracy to the one at Jodrell Bank. An 85-foot steerable radio telescope designed primarily for solar research was dedicated on Oct. 7, 1959, at the University of Michigan. The instrument, constructed with Office of Naval Research funds, is located on Peach Mountain about 16 miles northwest of Ann Arbor, Mich. An 84-foot steerable paraboloid antenna, under construction since February 1959 at Penticton, British Columbia, was due for completion late in the year.

CHARLES P. OLIVIER,
Emeritus Professor of Astronomy and Former Director of Flower and Cook Observatories, University of Pennsylvania.

ATMOSPHERE RESEARCH. Van Allen Radiation Belts.—Although the initial discovery of the radiation belts surrounding the earth was made in 1958, many details emerged from rocket and satellite flights in 1959. It was found that there are two major distinct zones of maximum radiation intensity surrounding the earth, referred to as the Van Allen radiation belts after their discoverer, Dr. James A. Van Allen of the State University of Iowa. Discovery of a third zone by the Explorer VI satellite was announced in late 1959 by the National Aeronautics and Space Administration.

These belts of radiation are regions in which protons and electrons are trapped by the earth's magnetic field. A charged particle moving in a magnetic field will spiral about lines of magnetic force, traveling in toward the earth until it is magnetically reflected and returned along the line of force. Once more it will spiral in toward the earth in the other hemisphere, and again it will be magnetically reflected. Hence the particle is "trapped," never escaping from this particular region of the earth's magnetic field, and surging back and forth from one hemisphere to the other in a fraction of a second. The particles will remain "trapped" for periods of many days, and will escape only by means of elastic scattering with gas atoms in the outer reaches of the earth's atmosphere.

The newly discovered third zone of radiation is centered about 1,200 miles above the earth, and is 300 miles thick. Of the two principal zones established earlier by Dr. Van Allen, the innermost one is located at 6,000 to 7,000 miles from the *center* of the earth and contains relatively hard radiation. Although the bulk of the energy in this zone is comprised of low-energy electrons (about 2×10^9 per cm.^{2} per second per steradian), there is a sufficient number of high-energy protons (about 2×10^9/cm.^{2}/sec./sterad) with energies greater than 40 Mev. (million electron volts) to be significant. Some of the protons have energies of many hundreds of millions of electron volts.

This intensity of radiation in the inner zone poses many problems of health hazard for future space travelers. By virtue of the fact that the inner radiation belt does not reach down to the earth's surface, nor does it encompass the polar regions, it may be possible for space travelers to go out through this gap in the radiation zones by means

of a polar trajectory. It is interesting to note that the nose cone of a recent Soviet rocket became radioactive on passing through the inner zone.

The outermost belt is most intense between 13,000 and 17,000 miles from the center of the earth. It contains more soft radiation than the inner zone, but none of the very hard radiation. There are approximately 10^{11} electrons/cm.^{2}/sec./sterad per cm.^{2} with energies greater than 20 Mev., and 100 protons/cm.^{2}/sec./sterad with energies greater than 60 Mev. The innermost of the two major zones of radiation appears to be quite stable in time, the radiation intensity remaining nearly constant from month to month. The radiation intensity in the slot between the two zones undergoes fluctuations of a factor of 10 times or more. The lower horn of the outer zone also appears to undergo large variations of radiation intensity with time.

Measurements of the intensity in the outer zone on March 3, 1959, made from the Pioneer IV satellite, showed it to be up by a factor of 100 times over similar measurements made from Pioneer III in December 1958. This increase in intensity followed five consecutive nights of auroral activity on the earth and the occurrence of an M region storm on the sun on Feb. 25, 1959. By late summer the intensity was down by a factor of three over that observed in December 1958. It seems likely that the particles trapped in the outer zone are replenished by solar plasma coming directly from the sun, but that they may not arrive with the high energies they later achieve by acceleration in the outer zone itself. It is still not known whether a blast of plasma from the sun will replenish the outer zone or whether it will temporarily wipe it out.

In the Soviet Union, scientists S. Dolginov and N. V. Pushkov placed a three-element, flux-gate magnetometer in Mechta, the first cosmic rocket launched Jan. 2, 1959, and detected an anomaly in the magnetic field surrounding the earth at about 13,000 miles altitude. The explanation for this anomaly could be the long-sought-after ring current around the earth—a westward drift of the protons trapped in the outer radiation belt and an eastward drift of the electrons.

Particle Bombardment of the Atmosphere.—Observations have been made by K. A. Anderson, of the State University of Iowa, concerning solar protons of energies 100 to 300 Mev. penetrating the atmosphere to balloon levels. Following such solar activity as an optical flare, radio frequency noise bursts, and a protracted noise storm, solar protons continued to flow into the earth's atmosphere for at least two days. Evidence from cosmic-noise radio-absorption measurements in the Arctic showed the presence of protons as late as 3½ days following the solar flare. Apparently the protons, after being ejected by the solar flare, are then trapped in the magnetic field of the sun and escape through some sporadic process involving turbulence and wave effects.

It is now becoming clear that strong ionization effects in the polar ionosphere result from the bombardment of the upper atmosphere by protons. There is also increasing evidence that these incoming particles undergo a spiral pattern centered on the magnetic pole as they travel in toward the earth. Incidental to this is the fact that sporadic E[1] occurrence in polar regions appears to have a spiral distribution, as does the distribution of auroras.

J. R. Winckler, of the University of Minnesota, has detected at balloon levels gamma ray fluxes of about 2×10^{-5} ergs/cm.^{2} sec. peaked in the 200 to 500 Kev. (thousand electron volts) region coincident with a solar flare. This appears to be bremsstrahlung radiation (produced by the deceleration of charged particles) which has escaped from the solar photosphere. Bursts of X-rays also have been measured at balloon altitudes directly beneath an auroral arc. (See also ASTRONOMY.)

High-Altitude Nuclear Tests.—Probably the most exciting and one of the most rewarding geophysical experiments ever conducted was the detonation of nuclear weapons in the ionosphere and in the exosphere in August 1958. On August 1 a megaton H-bomb called Teak was exploded at a height of 200,000 feet (60 km.), and on August 12 a megaton H-bomb called Orange was exploded at a height of 100,000 feet (30 km.) above Johnston Island in the Central Pacific Ocean. The results of these experiments have only recently become available. S. Matsushita and J. M. Malville of the University of Colorado have drawn some interesting deductions concerning atmospheric phenomena from these experiments.

Immediately following the explosions several events occurred. Artificial auroras were observed at Hawaii, along magnetic field lines, and in the vicinity of Apia, the magnetic conjugate point in Western Samoa. Strong counterclockwise circular electric currents were formed in the vicinity of Johnston Island at a height of 80 to 100 km., and these caused artificial magnetic storms in the Central Pacific. X-rays stemming from the explosion caused an increase in the D region absorption observed at Hawaii. Shock waves traveling at about 1.0 km./sec. caused irregularities of the electron density in the F layer at Hawaii. Ionization increased 10 times above normal over a wide area of the Pacific for 35 minutes after the first explosion and for 6 hours after the second explosion; the difference in time was due to the difference in height. A radio blackout occurred at Hawaii for 2 hours after each explosion. Strong radio wave absorption continued for many hours after the first explosion because of the greater height of the burst.

Beta decay electrons resulting from the fission fragments of an assumed 20-kiloton trigger bomb are capable of accounting for the artificial aurora observed above Apia. The distinctive violet color of the rays indicated a strong enhancement of the N_2^+ band system relative to the oxygen green line, and may imply that dissociative recombination rather than direct electronic excitation was the primary exciting mechanism for the forbidden OI lines. The high-altitude crimson arc may result from ion-atom interchange and dissociative recombination in a manner similar to the twilight enhancement of the oxygen red lines in the air glow.

The other high altitude nuclear explosions in 1958 (August 27 and 30, September 6) were three shots in the South Atlantic at heights of about 480 km., referred to as Project Argus. These experiments were not revealed until March 1959. Although these bursts were of great interest from the standpoint of the radiation belts and trapped particles, they were not of as much importance in the study of the upper atmosphere since their height was too great. (See also ATOMIC ENERGY.)

Ionosphere.—Observations made of the ion distribution in the ionosphere below 550 km. indicate that it is controlled not by diffusion but by changes in the recombination coefficient. Above 550 km. the ion distribution is diffusion controlled, according to F. S. Johnson of the Lockheed Aircraft Corporation. His findings indicate that there is a proton aureole surrounding the earth which can account for the propagation of "whistlers" and which originates from within the earth's atmosphere.

The phenomena of "whistlers," a class of very-low-frequency (VLF) radio waves originating with lightning discharges on the earth and traveling through the exosphere along lines of magnetic force before returning to the earth, has been well understood for several years. Another class of naturally occurring, very-low-frequency signals entering the atmosphere, which are not associated with lightning discharges but are strongly correlated with solar activity, has not been understood.

R. M. Gallet of the Central Radio Propagation Laboratory and R. A. Helliwell of Stanford University have come to the conclusion that many of these VLF emissions are generated by a "traveling-wave tube" mechanism—streams of high-speed ionized particles precipitating into the ionosphere in the presence of the earth's magnetic field. The electromagnetic waves which have been excited are then propagated in the same manner as "whistlers." The "traveling-wave tube" mechanism is one in which energy is transferred from the kinetic energy of electrons in a beam to an electromagnetic wave traveling at the same velocity. The theory requires particle velocities of the order of 10,000 km./sec. and electron densities in the exosphere which are in general agreement with "whistler" observations.

Assistant Chief, Radio Propagation Physics Division, Central Radio Propagation Laboratory, National Bureau of Standards, Boulder, Colo.

ATOMIC ENERGY. Important developments in the field of atomic energy in 1959 included the renewal of the informal three-power ban on testing atomic weapons, the successful carrying out by the United States of Project Argus, and a possible breakthrough in the search for a method of producing thermonuclear power.

[1] Sporadic E has been defined by Dr. E. K. Smith as follows: "By sporadic-E propagation is meant a comparatively strong and protracted [radio wave] transmission (several minutes to several hours) returned from the E region of the ionosphere by some mechanism other than the normal reflection process from the daytime regular E layer."

Weapons Tests.—The informal agreement among the United States, the United Kingdom, and the USSR to refrain from test explosions of atomic weapons first went into effect on Oct. 31, 1958, on the part of the Western powers, and on November 4 on the part of the Soviet Union.[1]

On Aug. 26, 1959, the United States announced that it would not resume nuclear tests for the remainder of 1959. On August 27, Great Britain stated that it would conduct no further tests so long as the conference then taking place in Geneva continued to produce "useful discussions." And on August 28, the Soviet Union announced that it would resume testing only if the Western powers did so. Major obstacles to agreement on a formal ban on atomic weapons have been the USSR's persistent refusal to permit unrestricted inspection of sites of suspected nuclear explosions, and its insistence on retaining veto powers so wide as to nullify the effects of agreements on other issues. (See also DISARMAMENT.)

On Nov. 4, 1959, France, which had for some time been developing an atomic bomb, advised the United Nations that it would conduct a nuclear test explosion of its own unless the United States, the USSR, and Great Britain consented to "renounce their nuclear armament." While no date for the test was given, French sources indicated that it would take place "more than a month and less than a year" after the United Nations announcement. It was made clear that unless the three countries which already had nuclear weapons agreed to halt production of such weapons, and to destroy their present stocks, the test would go through as scheduled—even if the three-power ban on testing were made permanent.

One major consequence of the ban on tests has been a slowing down of the development of new atomic weapons. Since the factor limiting possible use of atomic weapons in the event of war is no longer the amount of fissionable or fusion material available, but rather the weight of the individual weapons, a reduction in the weight of the weapons would increase correspondingly the atomic striking power of a given arsenal of aircraft and rockets. Reduction of weight can be accomplished, however, only by further testing of high-yield weapons.

When the informal ban on testing was imposed, the United States had scarcely begun test firings to develop offensive atomic weapons capable of resisting blast and radiation effects from nearby atomic explosions. Also, the program of test firings to develop new defensive weapons which would be lethal to such offensive atomic weapons was similarly curtailed.

Another major consequence of the ban is a reduction in the rate of radioactive fall-out. Radioactive particles produced by tests prior to Oct. 31, 1958, are falling to the earth in slowly diminishing quantities; nevertheless, the amount of radioactive dust on the ground continues to increase and may be expected to do so for several years, until the rate of fall-out becomes less than the rate at which the particles lose their radioactivity. The radioactivity of foods, also, may be expected to increase for several years. Even if there are no further tests, it will probably be at least 10 years before the radioactivity of foods becomes demonstrably less than it is at present, and the situation would be worsened by resumption of above-ground testing. (See also RADIATION; SANITARY ENGINEERING.)

Project Argus.—Just before the 1958 deadline for the cessation of weapons tests, the United States detonated three small atomic bombs 300 miles out in space. They were launched from the U.S.S. *Norton Sound*, from a position near the Falkland Islands in the South Atlantic, by means of special multistage liquid- and solid-fueled rockets. The effects of the explosions were monitored by the satellite Explorer IV, and by five-stage instrument-carrying rockets sent to an average altitude of 550 miles. These tests, constituting Project Argus, were conducted by the U.S. Navy, under the supervision of the Defense Department and the U.S. Atomic Energy Commission; the monitor rockets were launched by the Air Force, under the special code name of Project Jason.

As a result of the explosions, electrons (beta rays) from the fission products were trapped in the earth's magnetic field at altitudes ranging up to 4,000 miles at the equator, where they remained for an appreciable time as an artificial radiation belt. Very-low-frequency radio communications across the Atlantic were disrupted temporarily by these explosions, although high-frequency radio signals appeared to be unaffected. When the findings of Project Argus have been analyzed thoroughly, they are expected to throw light on the containment of plasma by magnetic fields (a major problem of thermonuclear research), and on problems related to manned space flight and the radio control of guided missiles.[2] The theoretical basis of the Project Argus experiments was worked out by Nicholas C. Christofilos of the University of California's Lawrence Radiation Laboratories at Livermore. (See also ATMOSPHERE RESEARCH; SPACE FLIGHT.)

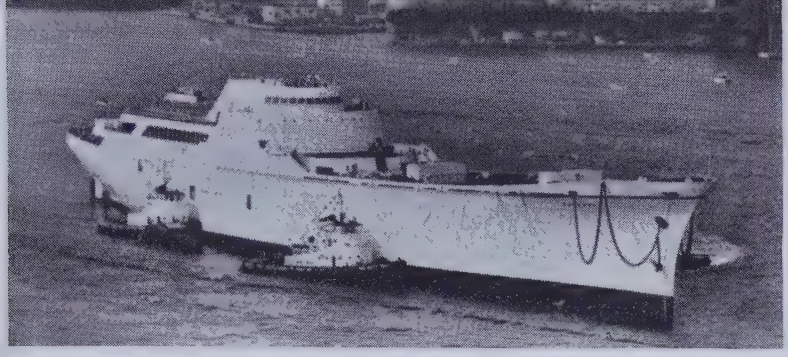
Thermonuclear Power.—Although many of the experimental thermonuclear power devices under investigation in 1958 have failed to produce the controlled fusion reaction hoped for, there was evidence late in 1959 that some thermonuclear power had been produced in the Los Alamos apparatus known as Scylla and in the Naval Research Laboratory's high-density magnetic mirror apparatus.

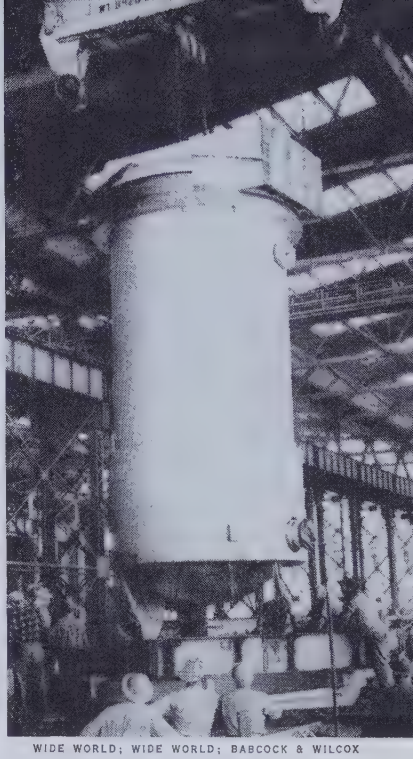
Another encouraging event was Los Alamos Scientific Laboratory's announcement in October of a revolutionary approach to the goal of controlled production of thermonuclear power. Described by some scientists as offering the greatest promise for the eventual development of a successful power reactor since the beginning of the United States thermonuclear power program, the new apparatus—like its predecessors—is based on the concept of containing intensely hot plasma (ionized gas) in a thermonuclear reaction zone by means of magnetic fields. The new apparatus incorporates a magnetic-containment field of an unusual shape, and relies on a novel method for introducing plasma into the field. The magnetic-containment field consists of four inward-curving, cusp-shaped magnetic fields, constituting what its designer, Dr. James L. Tuck, calls a "picket fence" enclosure. The "picket fence" shape promises to be free of the instability which has plagued the outward-curving magnetic enclosures of other experimental apparatus. To inject deuterium plasma through the "walls" of the magnetic enclosure, and into the reaction zone, an extremely powerful ion gun, developed by Dr. John Marshall, is employed.

In the event that magnetic-containment techniques (on which research has heretofore been concentrated) prove inadequate, an approach with

[1] Previously the USSR had unilaterally suspended nuclear tests from April to September 1958. It is believed that a test on November 3 was the last nuclear explosion in the USSR.

[2] One important result of the analysis of Project Argus data was announced late in 1959 by Army Signal Corps scientists at Fort Monmouth, N.J. It has been established that, in addition to the shell of electrons trapped in the earth's magnetic field, a second shell was formed by the explosions, consisting of waves of hydromagnetic energy circling the earth in the ionosphere at an altitude of 1,200 to 1,800 miles.





WIDE WORLD; WIDE WORLD; BABCOCK & WILCOX

(*Left*) Nuclear-powered surface ships include (top) the U.S. merchant ship *Savannah*, christened in 1959 and scheduled for service in 1960, and (bottom) the Soviet Union's icebreaker *Lenin*. (*Right*) The *Savannah's* reactor, here being loaded into its container, will carry 690 pounds of uranium-235 and enable the ship to travel 350,000 miles without refueling.

a different theoretical basis must be found if economical thermonuclear power production is to become a reality. For this reason, some universities, including Harvard and the Massachusetts Institute of Technology, have not constructed devices aimed directly at the generation of power, but rather have concentrated on basic research in the field. The universities mentioned received large grants in 1959 from the U.S. Atomic Energy Commission (AEC) for such research.

Even if the findings of experiments with magnetic-containment apparatus should turn out to have only indirect application to the problem of thermonuclear power generation, they are directly applicable to problems of missile re-entry, of radiation in outer space, and of advanced types of nuclear power plants for space vehicles. The very hot, very-low-density gases (consisting mostly of atoms stripped of their outer electrons, the outer electrons themselves, and photons) which constitute plasma are of central importance in the investigation and exploitation of outer space, and much of what is now known about them has been learned from magnetic-containment experiments originally directed toward production of thermonuclear power.

Atomic Power and Propulsion. *Power Plants.*—On Oct. 15, 1959, the Commonwealth Edison Co. announced the first chain reaction at its 180,000-kilowatt Dresden power plant, 50 miles southwest of Chicago. After further testing, the plant is expected to begin producing electricity early in 1960, with full operation by the middle of the year. Commercial power is presently in production at the United States first full-scale atomic power plant (60,000-kw.) at Shippingport, Pa., and at two small experimental reactors at Santa Susana and Pleasanton, Calif. Including the Dresden plant, sixteen commercial nuclear power projects were under way at the end of 1959. Three of these were scheduled to begin regular operation in 1960, and three more in 1961. (See also ELECTRICAL DEVELOPMENTS; PUBLIC UTILITIES.)

A bill approved on June 2, 1959, by the Joint Congressional Committee on Atomic Energy authorizes the construction of eight new power reactors, including five small prototype plants, to be financed by the government or by private industry with government assistance; a 30,000- to 75,000-kw. plant to be built by private industry with government assistance in research and development; a similar plant to be constructed by the government and operated by a public power group or rural cooperative; and a 15,000-kw. plant of advanced design to be built by the AEC alone or in cooperation with Puerto Rico. The bill also authorizes an increase in the capacity of the Shippingport, Pa., plant to 150,000 kw.

A report by Walter H. Zinn (formerly director of the Argonne National Laboratory), prepared in 1959 for the Joint Congressional Committee on Atomic Energy, concludes that the USSR is somewhat ahead of the United States with respect to the total power generated in experimental and power reactors, but that the reactor types now operating in the Soviet Union are less diverse than those in the United States. (The USSR is known to have graphite-moderated, pressurized-water, boiling-water, fast, and breeder reactor types.) Apparently neither country has settled on a single reactor type as best suited to the development of electric power, and both will continue to operate many types until this decision has been reached.

Ships and Submarines.—The nuclear-powered merchant ship *Savannah* was launched on July 21, 1959, at Camden, N.J. Costing $41 million, the vessel displaces 21,840 tons and can carry 10,000 tons of cargo and 60 passengers. Her reactor contains 690 pounds of uranium-235, and she will be able to cruise 350,000 miles without refueling at her rated speed of 20¼ knots. Sea trials will probably be held in the spring of 1960. While it is not expected that the *Savannah* will be economically competitive with conventional merchant ships, it is believed that experience with her will lead to designs which are competitive.

On April 15, 1959, the nuclear-powered submarine *Skipjack* was commissioned by the U.S. Navy, bringing the number of atomic-powered submarines under commission to six. Eight additional atomic submarines had been launched by the end of the year, including the *Seadragon* and *Triton* in August 1958; and, in 1959, the *Halibut* (January), *George Washington* (June), *Patrick Henry* (September), *Theodore Roosevelt* (October), *Robert E. Lee* (December), and *Scorpion* (December). Other nuclear-powered ships under construction included the guided-missile cruiser *Long Beach*, launched in July 1959; the guided-missile frigate (or destroyer leader) *Bainbridge;* and the aircraft carrier *Enterprise.*

Aircraft.—Propulsion systems for both manned and unmanned aircraft are being developed by the AEC and the Department of Defense in a joint program. For manned aircraft, direct-cycle power plants (in which air is mechanically compressed, heated by passage through a nuclear reactor, and then expanded through a turbine just as in conventional jet engines) and indirect-cycle types (in which heat is transferred from the reactor to the jet engine by means of a liquid metal) have been the subject of intensive experimentation. Many flights have been made in a test airplane fitted with a one-megawatt reactor and a complete radiation shield for the crew. The reactor was not used for propulsion on these flights.

In a ground test of a direct-cycle engine, the airflow through a nuclear element was interrupted deliberately while the engine was operating at full power. Parts of the nuclear element melted down within 15 seconds and a considerable quantity of radioactive material was blown out of the engine, forcing discontinuance of the test. Only the obstructed part of the engine was damaged, however, indicating that had such an accident happened in the air the aircraft would not have been endangered.

Other aircraft power plants under development include a nuclear-powered ramjet engine capable of high-speed travel within the earth's atmosphere (Project Pluto) and a nuclear-propelled rocket (Project Rover).

Direct Conversion of Nuclear Energy to Electricity.—Although there are some exceptions, including the direct use of heat from nuclear fission to warm buildings and to generate industrial steam, most applications of nuclear energy require the conversion of reactor heat into electricity. Normally, such conversion is effected by generating steam in a boiler, producing mechanical energy by means of a steam engine, and (finally) converting the mechanical energy into electricity by means of an electrical generator. Since the overall efficiency of this process is low and the cost of the equipment is high, the desirability of direct conversion of nuclear heat to electric energy, bypassing the intermediate mechanical stages, has long been apparent.

In April 1959 the first promising device for generating electricity directly from reactor heat was announced by the Los Alamos Scientific Laboratory. The experimental generator produced approximately 50 watts of direct current (25 amperes at 2 volts) from a cylinder approximately 1 inch in diameter and 6 inches long. Essentially the device is a thermocouple consisting of a tiny rod (the hot element) made of a mixture of zirconium carbide and uranium-235 carbide, enclosed in a metal sheath (the cold element), with the space between rod and sheath filled by cesium vapor. The amount of uranium-235 present in the hot element is too small to support a self-sustaining fission reaction. When the cylinder is placed in a reactor, neutrons generated by the reactor cause the fission of uranium-235 in the hot element; the heat of fission ionizes the cesium vapor to electrically conductive plasma; and the high temperature difference between the rod and the oil-cooled sheath drives electrons from the hot element to the cold element. The electrical current thus generated may be utilized in a circuit connected to the two elements of the thermocouple.

The development of a compact and self-contained nuclear thermoelectric generator, superior to batteries for many low-power applications, was announced by the AEC in January 1959. Officially designated SNAP III, the five-pound unit contains 20 pairs of thermocouples (constructed of lead telluride alloyed with bismuth, manganese, and other substances) radiating in a spokelike arrangement from a central core which contains a pellet of radioactive polonium-210 weighing two thirds of a gram. The polonium pellet reaches a temperature of 720°F. by radioactive decay, and the resulting flow of heat through the rods of lead-telluride alloy generates a small electric current. Over a period of 140 days (the half-life of polonium-210), SNAP III produced 5 watts of electricity, converting heat into electric current with an average efficiency of 8 to 10%. For some time after this period the generator produced about 3 watts, at a lower efficiency. Although the polonium isotope used in the experimental prototype is inordinately expensive ($30 million), it is expected that the use of relatively inexpensive radioactive substances will reduce the cost of subsequent models to the point where they may be used economically to power buoy lights, automatic weather stations, and space satellite instruments.

In November 1959 the AEC announced the development of a 250-pound miniature atomic power plant, the SNAP II, capable of generating 3,000 watts for a long period of time. Consisting of a miniature reactor together with a tiny, 30-pound mercury-vapor turbine, SNAP II is expected to be used as a power supply in large, heavily instrumented satellites and space probes to be launched by the United States.

Synthesis of Heavy Elements.—The heavy-ion linear accelerator (HILAC) at the University of California's Lawrence Laboratory has exceeded its designers' expectations in the creation of synthetic elements with atomic weights greater than that of uranium.

Atomic piles had previously been used for the production of plutonium, americium, and curium, but elements heavier than curium were obtainable in atomic piles only in extremely small quantities. An additional difficulty with the atomic pile process is that it does not produce all of the isotopes of the transuranium elements.

In the new method of synthesizing heavy elements, uranium and other elements of high atomic weight are bombarded by the accelerator with ions of elements near the middle of the periodic table. Of the great variety of products obtained from the bombardment, most are stable or radioactive isotopes of familiar elements, but occasionally a heavy ion is captured by a heavy atom, and a superheavy atom—beyond uranium in the periodic table—is produced. The elements thus far produced by both processes have been members of the actinide series, analogous to the rare earth series further up in the periodic table. (See also CHEMISTRY.)

Distillation of Fresh Water from Salt Water.—The AEC and the Department of the Interior have announced plans to build a low-temperature pressurized-water type of nuclear reactor, with a capacity of 40,000 thermal kilowatts, to convert salt water to fresh water. The reactor, to be constructed at Point Loma, San Diego, Calif., will produce steam under pressures up to 175 psi to be used in the conversion plant. The salt water will be passed through a flash distillation unit where much of it will evaporate in the form of a low-salt-content vapor, leaving behind a salty brine. The vapor will then be condensed to produce fresh water.

U.S. Atomic Energy Commission.—Commissioner John S. Graham was reappointed to another five-year term in 1959. Commissioner Willard F. Libby resigned to return to teaching at the University of California at Los Angeles, and Dr. John H. Williams, director of the commission's Division of Research since 1958, was appointed to replace him.

International Cooperation.—The United States signed atomic pacts with Great Britain and France on May 7, 1959. The agreement with Britain provides for the exchange of United States enriched uranium for plutonium made in British reactors, and for supplying Britain with design data on the construction of an atomic submarine, with details of weapons design data, and with nonnuclear parts of nuclear weapons. The agreement with France provides for supplying that country with enriched uranium to be used in the development of an atomic submarine power unit. Other agreements signed in May by the United States arranged for providing Canada, the Netherlands, Turkey, and West Germany (all North Atlantic Treaty Organization members) with the information and equipment necessary to train their military forces in the use of atomic weapons.

On Nov. 24, 1959, the United States and the Soviet Union signed an agreement covering a cooperative program of nuclear research, possibly including the joint construction of a large particle accelerator for use by scientists of all countries. The agreement may mark an important step in removing the secrecy that has characterized atomic research in most countries.

Under its Atoms for Peace Program, the United States continued in 1959 to supply other countries with nuclear materials, reactors, and technical information to advance their atomic projects. Besides the portions of the program being arranged through the European Atomic Energy Community (q.v.), assistance in setting up atomic research reactors has been given to individual countries, including Panama, the Philippines, and South Korea; and on November 1, the Export-Import Bank of Washington announced a loan of $34 million to aid a group of North Italian utilities in setting up a 165,000-kw. nuclear power plant. This was the bank's first loan for a foreign nuclear power plant.

AGENCY; and for further references, see the Index entry, *Atomic Energy.*)

EDWARD S. GILFILLAN, JR.,
Professor and Head of the Department of Nuclear Engineering, Lowell Technological Institute.

AUSTRALIA, Commonwealth of. Situated wholly in the Southern Hemisphere, Australia is the world's smallest continent and largest island. Its area (2,974,581 square miles, including adjacent Tasmania) is nearly as large as that of the continental United States, excluding Alaska; its compact land mass, encompassed by a 12,210-mile coastline, is more than three quarters the size of Europe. Politically, the Commonwealth is a federation (inaugurated Jan. 1, 1901) of 5 mainland states, 2 federal mainland territories, and the island state of Tasmania. These together form a self-governing, independent nation, whose citizens acknowledge the sovereignty of Elizabeth II as "Queen of Australia." Australia is a member of the Commonwealth of Nations (q.v.) and of the United Nations.[1]

The component states and territories of Australia, including capital cities, and their populations as of June 30, 1958, are as follows:

COMMONWEALTH OF AUSTRALIA

State or territory	Square miles	Population[1]	Capital (and population)[1]	
New South Wales	309,433	3,689,175	Sydney	(2,016,000)
Victoria	87,884	2,741,397	Melbourne	(1,726,000)
Queensland	670,500	1,417,404	Brisbane	(555,000)
South Australia	380,070	896,750	Adelaide	(544,000)
Western Australia	975,920	705,250	Perth	(382,000)
Tasmania	26,215	335,418	Hobart	(105,110)
Northern Territory	523,620	19,579	Darwin[2]	(8,066)
Australian Capital Territory	939	41,167	Canberra[3]	(39,061)
	2,974,581	9,846,140		

[1] June 30, 1958, est., excluding persons in employment camps; excluding also aborigines (full-blood, 47,000; half-blood, 27,000; est., 1947 census). [2] Municipality of Darwin, created June 28, 1957. [3] Federal capital.

Population Trends.—Low or irregular rainfall makes heavy settlement impossible over four fifths of Australia, the population density over the major portion of most states being less than 1 person in 8 square miles. About half the population lives in the capital cities. In 1958 the natural increase of the population was 138,781, and net immigration, 65,366; the aggregate increase of 204,147 represented a decline of 0.16% from the growth rate of 2.25% recorded in 1957. The estimated population on Dec. 31, 1958, was 9,951,618, compared with 9,747,471 a year earlier, and reached an estimated 10 million on March 10, 1959—a historic mark in the Commonwealth's population growth.

During 1958, long-term and permanent arrivals from other countries totaled 109,857, including 60,196 of British nationality. With departures numbering 44,978, net immigration was 64,879, compared with 77,622 (revised figure) in 1957. Arrivals from the United Kingdom and Ireland totaled 44,062 in 1958. Other principal sources of immigrants (all figures net) were Hungary (9,866), the Netherlands (5,691), Germany (4,620), and Greece (4,292). Persons provided with free or assisted passages totaled 696,830 up to June 1958.

Government.—Queen Elizabeth II is represented by a governor general (Viscount Dunrossil, formerly W. S. Morrison, speaker of the House of Commons, was appointed governor general on Nov. 12, 1959, to succeed Field Marshal Sir William Slim).

The governor general is advised by an Executive Council (comprising the ministers of state sitting as ex officio members), over which he presides. This body gives legal form to decisions of the cabinet, these being taken independently at private meetings presided over by the prime minister (Robert G. Menzies since Dec. 19, 1949), to which ministerial heads of departments are invited as required.

The federal Parliament comprises a 60-member Senate (10 members elected from each state) and an elected 124-member House of Representatives. The latter includes two members (one each from the Northern Territory and the Australian Capital Territory) who may take part in debate but vote only on questions affecting their territories. As in the United States, the powers of the federal Parliament are enumerated and limited to such areas as finance, commerce, defense, and foreign affairs. State legislatures (bicameral except in Queensland) retain jurisdiction in such fields as education, health, and public transportation. No state religion may be established.

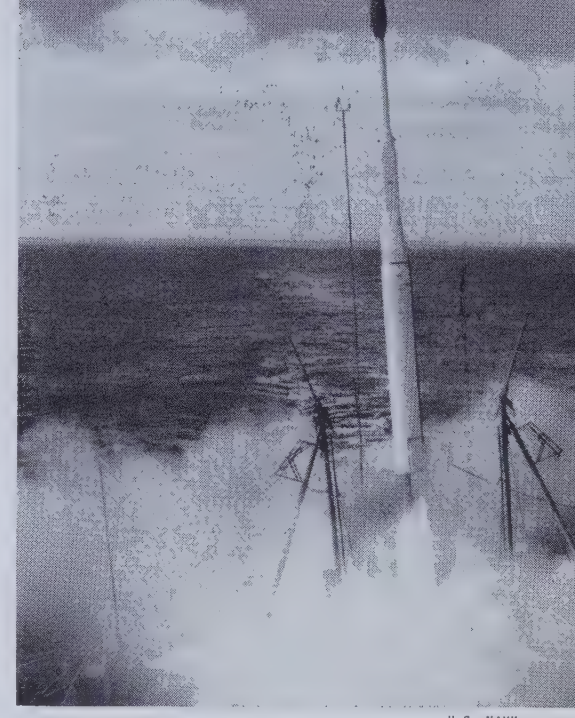
Final returns in the elections held Nov. 22, 1958, for the 23d federal Parliament showed that 5,141,109 out of 5,384,624 enrolled voters in the six states cast their ballots. The government, a Liberal-Country coalition, was returned to power with its majority increased to a record 32 in the House of Representatives. The coalition has held a Senate majority of 4 since July 1, 1959. New cabinet members in the seventh Menzies ministry included Harold E. Holt, who succeeded Sir Arthur Fadden as treasurer, and A. G. Townley, succeeding Sir Philip McBride as minister for defense.

Finance.—The 1958–59 budget results showed a total cash outlay of £A1,584,960,000 (consolidated revenue fund expenditure, £A1,297,243,000), against cash available, £A1,555,425,000 (consolidated fund receipts, £A1,287,882,000), producing a deficit of £A29,535,000, compared with a previously estimated £A110 million. (The Australian pound equaled U.S. $2.234, selling rate, or 20 shillings sterling, as of Aug. 31, 1959.)

Total cash resources were estimated under the 1959–60 budget at £A1,621,263,000, including £A1,204,625,000 from taxation, £A119,800,000 in post office revenue, and £A134,740,000 from other business undertakings. Total cash requirements of £A1,682,000,000 produced an overall deficit of £A60,737,000. Main charges to the consolidated revenue fund included: defense, £A192,800,000 (in 1958–59, £A189,300,000); national welfare fund, £A300,785,000; and payments to the states, £A321,728,000.

Education.—After federation the states retained responsibility for education in their respective jurisdictions; in the federal territories the Commonwealth government controls the public education systems. Preschool centers (236 in 1956) are conducted by a number of government-subsidized organizations, and broadcasting is used in preschool training. Attendance in primary schools is compulsory at the age of six years under the state school systems, but most Australian children begin school at the age of five. State schools in 1957 numbered 7,703 (New South Wales, 2,551), with 50,014 teachers and 1,425,126 pupils; nongovernment schools totaled 1,994, with 13,712 teachers and 453,979 pupils in 1956; and enrollment in Roman Catholic schools was 348,000 in 1956.

[1] The Commonwealth of Australia government also administers the Territory of Papua and the trusteeship Territory of New Guinea (see PAPUA AND NEW GUINEA, TERRITORY OF), the trust territory of Nauru (q.v.), Norfolk Island (q.v.), the Territory of Ashmore and Cartier Islands, the Cocos (Keeling) Islands, the Antarctic islands of Heard and MacDonald, and the Australian Antarctic Territory, comprising the region south of latitude 60°S. and between longitude 160° and 45°E. (other than Adélie Coast). Christmas Island (q.v.) in the Indian Ocean was transferred to Australian sovereignty Oct. 1, 1958.



U.S. NAVY

Multistage rocket aboard the U.S.S. *Norton Sound* in the South Atlantic is used to fire a small atomic bomb 300 miles into space in 1958, as part of Project Argus tests.

Facilities for higher education include technical, teachers, and agricultural colleges; nine universities, including a university in each state capital; the University of New England, at Armidale, New South Wales; and a university college (a branch of Melbourne University) at Canberra. Also located at Canberra is the Australian National University, which provides postgraduate education in four research schools. In Victoria a second university (the Monash University) was being established in 1958. Students enrolled at Australian universities (excluding the National University) totaled 36,815 (new students, 10,395) in 1957, and 3,176 bachelor degrees were conferred.

Social Welfare.—Provided by both Commonwealth and state governments, Australian social services are among the most diverse and far-reaching in the world, ranging from medical service (the Royal Flying Doctor) for patients in remote areas, to pensions for deserted wives (nearly 10,000 paid in 1956–57). Federal expenditure on social and health services had advanced from £A176,565,000 in 1953–54 to £A247,485,000 in 1957–58. Old-age pensions and those for invalids were being paid to 574,208 persons as of June 30, 1958, and allowances were being paid to 1,415,378 families with 3,073,945 children.

Six states together spent £A64,141,000 in 1956–57 on the care of the sick, relief of the aged, indigent, and infirm, and child welfare. Australian war pensions current on June 30, 1958, numbered 628,362, representing expenditure of £A50,278,000 for the previous fiscal year. Other service pensions in force in 1958 totaled 42,203, representing payment of £A5,630,000.

Defense.—Personnel strength in 1959 of the chief arms of defense were estimated as follows: army, 20,200; navy, 10,947; and air force, 15,260. Citizen personnel serving with the regular forces comprised 49,000 in the army, including national servicemen in training; 8,147 in the navy; and 828 in the air force. The cumulative call-up total for national service in the army was 180,692 to June 30, 1958. Providing for increased pay and allowances in all three services, Australia's overall expenditure for defense was estimated at £A190 million in 1958–59, including army, £A63,512,000; navy, £A42,401,000; and air force, £A59,302,000.

Extension of facilities for the testing of British weapons at Woomera, South Australia, continued in 1959. With consent of the Western Australian government, the target area was enlarged into uninhabited country between Port Hedland and Broome, making this the longest overland rocket range in the free world.

Transportation and Communications.—In 1957–58, passenger journeys on Commonwealth and six state railways aggregated 494,289,000, compared with 499,516,000 in the previous year, a loss of 5,227,000. Goods and livestock carried also showed a decline, from 47,476,000 tons in 1956–57 to 44,945,000 tons in 1957–58. Fourteen domestic air services, including Australian National Airways, flew a total of 41,894,000 miles and carried 2,151,613 passengers, a decline of approximately 1,460,000 miles and 2,250 passengers from the 1956–57 totals. The government-owned Qantas Empire Airways flew 59,390 route miles on international flights in 1957–58, an increase of 6,694 over the previous 12 months, and carried 84,624 passengers (76,158 in 1956–57). Airmail carried within Australia totaled 2,292,723 pounds in 1957–58; on overseas flights, 2,395,321 pounds.

On June 30, 1958, there were 1,936,960 telephones (1,416,023 automatic), of which 1,229,227 were served by metropolitan exchanges. Some 164 radio stations (56 national; 108 commercial) served 2,137,865 licensed receivers in 1957–58, and as of Sept. 30, 1958, television viewers' licenses totaled 390,059, and were increasing at the rate of 1,000 daily. Six television stations were in operation, comprising one national and two commercial stations in each of the cities of Sydney and Melbourne; six additional commercial licenses had been approved.

Roads open to general traffic approximated 519,000 miles in 1958, of which about 33% were macadam or similar composition. Motor vehicle registrations totaled 2,526,692 (automobiles, 1,676,055) in 1957–58.

General Economy.—Despite a trend in world trade unfavorable to primary-producing countries, the Australian government announced on July 31, 1959, that it was raising its imports licensing quota by £A50 million over the existing quota of £A800 million. Citing the strong position of the nation's economy, the government also announced a considerable easing of the licensing discrimination against the dollar countries, and said that it hoped to remove the remaining curbs altogether.

Retail sales for the year were expected to exceed the 1957–58 figure of £A3,089 million. Farm industries were doing well, and a record production of beef and veal was predicted in 1958–59. In the 1959–60 season, wheat exports were expected to rise substantially, while in 1959 black coal exports (800,000 tons in 1958) reached an estimated million tons for the first time since 1924.

The government's aim of achieving a steady rate of economic expansion faced the stumbling block of unemployment which rose by 17,000 early in 1959 to almost 82,000, or about 2% of the labor force of 4 million. This was the highest level in a decade. (See also below, *Principal Events, 1959.*)

Agriculture and Lumbering.—With a wheat area of 8,848,000 acres under cultivation in 1957–58 (an increase of some 974,000 acres over the previous year) and excellent seasonal conditions in all states, the harvest was expected to reach between 200 and 215 million bushels in 1958–59—approximately 100 million bushels more than the drought-reduced harvest of 1957–58. Average wheat production had been 186,500,000 bushels in the decade ending with the 1956–57 season. New South Wales, with an estimated yield of 67 million bushels, was responsible for most of the increase.

For the first time since 1947, sheep numbers failed to increase; they totaled 149,709,000 in March 1958, compared with a record 149,850,000 in the previous year. There was also a decline in dairy cattle (from 5,131,000 to 5,008,000), reversing a trend prevalent since 1952, while the number of beef cattle fell to 11,919,000 in 1958 from the 1957 figure of 12,005,000. Pigs totaled 1,424,000 in 1958, an increase of 7.5% over the previous year. Production of fresh meat increased slightly in 1957–58 to 1,286,000 tons, but the output of whole milk (1,261 million gallons); farm and factory butter (175,771 tons); and cheese (34,899 tons) showed declines.

Australian wool production in 1958–59 was expected to contribute 1,544 million pounds (greasy basis), compared with 1,463 million pounds in the previous season, to an estimated world yield of 5,063 million pounds. Some 157,500,000 sheep and lambs were shorn for a total of 1,341 million pounds of shorn wool, compared with 1,320 million pounds in 1957–58. In the season ending June 30, 1959, 4.8 million bales (297 pounds each) were sold, representing an increase of 400,000 bales over the previous season. A price decline starting in 1957 continued into the 1958–59 season, during which sales at auction yielded £A295.7 million, £A42.1 million less than in the previous season. The declining receipts reflected in part an average price drop of 13.88 pence per pound.

The production of sawn timber in the 1958–59 season was 1.4 billion superficial feet, representing a slight decline from the previous year.

Mineral Production.—Mining and quarrying of a wide variety of mineral products was valued in 1958–59 at £A176,320,000. Gold output of 1,102,731 ounces during the 1958 calendar year made Australia the fourth largest gold producer in the free world. Copper production was expected to reach about 120,000 tons annually in the next five years; 53,225 tons were mined in the first nine months of 1958. An estimated 20,362,000 tons of black coal and 11,600,000 tons of brown coal were produced in 1958. Tonnages of some of the other minerals produced in the same year were: asbestos, 12,500; aluminum, 10,712; tungsten, 900; zinc, 200,539; and lead, 333,264.

Industrial Production.—Some 360 new manufacturing projects, each involving expenditure of £A50,000 or more, were launched in Australia in 1957–58, with New South Wales and Victoria continuing to lead in industrial production. Heavy industry included output of 2,284,000 tons of pig iron, 3,106,000 tons of ingot steel, and 39,111 tons of tin plate in 1957–58. Production of manufactured gas (48,284 million cubic feet) reached a record level. The building industry used 883 million bricks and 2,320,000 tons of cement.

Other industrial output in the same period included woven woolen cloth, 32,133,000 square yards; rayon cloth, 21,305,000 square yards; cotton yarn, 44,492,000 pounds; women's hosiery, 2,126,000 dozen pairs; and boots and shoes, 21,298,000 pairs. The production of appliances in 1957–58 included 285,300 television sets, 193,700 refrigerators, and 164,100 washing machines.

Progress continued in the development of the motor vehicles industry, which is geared to local market requirements of about 240,000 commercial vehicles and passenger cars annually. Motor bodies produced in 1957–58 numbered 230,412.

Electric Power.—At the end of April 1959, power from the Snowy Mountains hydroelectric and irrigation project (one of the largest of its kind in the world) in southeastern Australia began to flow through 90 miles of transmission lines into the New South Wales electric system. The 320,000-kilowatt power station in which it is generated is over 1,000 feet underground. Later in 1959 a 14-mile-long tunnel was expected to go into service, providing the first diversion of waters from the Snowy River for irrigation in western New South Wales.

Including output from the Snowy Mountains station, the installed generating capacity of main electric systems increased by some 313,430 kw. to a total of 4,570,543 kw. in the year ended June 30, 1958. Total electricity generated for public supply and private use (including factories) rose to 19,793 million kw.-hr. in 1957–58.

External Trade.—In the year ending June 30, 1959, exports (£A803,600,000) exceeded imports (£A796,700,000) by £A6,900,000, compared with a favorable balance of £A27,200,000 in the previous year. Chief exports in the 10 months ending April 30, 1959, were foodstuffs of animal origin (butter, 150,225,000 pounds; beef, 422,647,000 pounds; lamb, 88,601,000 pounds) and of vegetable origin (flour, 790,816,000 pounds; barley, 539,000 tons; oats, 206,396 tons; wheat, 1,186,449 tons; rice, 680,379 hundredweight; and apples, 1,946,723 bushels). Also exported in the same period were hides and skins (72,026,000 pounds); oil (155,996,000 gallons); coal (513,104 tons); and zinc (217,000 tons). Principal imports during the 10 months included foodstuffs valued at £A29,005,000; tobacco, £A13,757,000; textiles, £A55,813,000; apparel, £A80,561,000; oils and fats, £A86,456,000; metal manufactures, £A116,017,000; machinery, £A242,291,000; and paper, £A29,159,000.

Greasy wool exports for the year ended June 30, 1959, totaled 1,188,377,000 pounds, valued at £A264,245,000, compared with 1,080,634,000 pounds, valued at £A324 million, in the previous year. The United Kingdom, with 304,779,000 pounds, was the chief buyer, followed by Japan, 274,568,000 pounds.

Principal Events, 1959.—For several million Australians the year's most notable development was the government's decision to reduce the individual income tax by 5%, and to increase pensions for the aged, invalids, widows, and ex-servicemen. The federal treasurer, Harold E. Holt, in announcing these measures on August 11, gave an optimistic account of the Commonwealth's economic position. The year 1958–59 showed, he said, substantial rural production. The majority of industries increased their output. Construction of houses and apartments was at the rate of 80,000 a year. Some 242,000 new motor vehicles were registered—an increase of 14,000 over the previous year. New money raised by listed companies amounted to £A144 million in the first nine months of 1958–59, an increase of 72% over the corresponding period of 1957–58. Overseas reserves fell by only £A10 million, and on June 30, 1959, stood at £A515 million.

AUSTRALIA NEWS AND INFORMATION BUREAU (J. TANNER)

Princess Alexandra of Kent, in Australia in August as Queen Elizabeth's representative at the Queensland centenary celebration, attends a ball with Prime Minister Menzies.

The government announced on March 16 that it had agreed with the Soviet Union to restore diplomatic relations. Relations had been broken off in April 1954 after the defection of Vladimir Petrov, third secretary at the Soviet embassy, reportedly with secrets of Soviet espionage in Australia.

On February 4 the Australian government took over the scientific research base at Wilkes Station, Antarctica, established by the United States during the International Geophysical Year. Operation of the base will be continued, without charge or liability, under an agreement with the U.S. State Department. (See also ANTARCTICA.)

Prime Minister Robert G. Menzies made a five-day visit to the United States in May to discuss foreign and financial matters with President Eisenhower and other United States officials. On December 1 he arrived in Djakarta, Indonesia for a one-week official visit—the first such visit by an Australian prime minister. After talks with President Sukarno, aimed at improving relations between the two countries, Prime Minister Menzies continued on to Kuala Lumpur, Malaya, for a five-day visit.

The National Capital Planning Committee, appointed to consider the future development of Canberra, released on May 8 the report of Sir William Holford, professor of town planning at the University of London. It recommended, among other improvements, the construction of a new Parliament House, a civic auditorium, and a house for the Queen of Australia, Elizabeth II.

Sir Josiah Francis, Australia's consul general in New York, said in Brisbane on March 1 that there was a possibility of assisted passages being arranged for United States citizens intending to settle in Australia. Inquiries at his office respecting immigration regulations and living conditions in the Commonwealth reached a volume of 4,000 a week in 1959.

DONOVAN ROWSE,
Author and Publicist.

AUSTRIA. Under a parliamentary declaration issued on June 7, 1955, in conjunction with the state treaty of July 27, 1955, Austria is a neutralized state with the borders of Jan. 1, 1938, an area of 32,375 square miles, and a frontier of 1,648 miles, bordering on six countries. It is a member of the United Nations, the Council of Europe, and the Organization for European Economic Cooperation (OEEC).

Population.—The population, which at the census of June 1, 1951, totaled 6,933,905, was estimated to be

7,021,000 in mid-1958. In the spring of 1959, 56,000 refugees were registered with the Ministry of the Interior, and it was estimated that another 32,000 lived in Austria without being registered. On March 31, 1959, the capital, Vienna, had a population of 1,652,427. Other leading cities (1951 figures) are Graz (226,453), Linz (184,685), Salzburg (102,927), Innsbruck (95,055), and Klagenfurt (62,782).

Government.—Dr. Adolf Schärf (Socialist) was elected president on May 5, 1957, for a 6-year term. The cabinet as reconstituted on July 14, 1959, following the parliamentary elections is again headed by Julius Raab (People's Party), and consists of an equal number of representatives from the People's and Socialist parties. The People's Party holds the federal chancellorship (Raab) and the ministries of Education (Heinrich Drimmel), Finance (Reinhard Kamitz), Agriculture (Eduard Hartmann), Trade (Fritz Bock), and Defense (Ferdinand Graf); the Socialists hold the vice chancellorship and the Ministry of Nationalized Industries (Bruno Pittermann), as well as the ministries of Foreign Affairs (Bruno Kreisky), Interior (Josef Afritsch), Justice (Otto Tschadek), Social Administration (Anton Proksch), and Communications and Electric Power (Karl Waldbrunner). The People's Party was accorded two state secretaries, attached to the ministries of the Interior and Foreign Affairs, while the Socialists received state secretaries attached to the ministries of Trade and Defense. Leopold Figl (People's Party), former chancellor and the minister of foreign affairs in the outgoing cabinet, was elected president (speaker) of the National Council on June 9.

The upper chamber of Parliament, the Federal Council, is composed of 50 members chosen by the 9 provincial legislatures, seats being distributed in proportion to the population of each province. The People's Party holds 26 seats; the Socialists, 24. Elections to the National Council (National Assembly), the 165-seat lower chamber, were held on May 10, 1959, with the following results (former post-World War II election results in parentheses): People's Party, 79 (1945, 85; 1949, 77; 1953, 74; 1956, 82); Socialists, 78 (1945, 76; 1949, 67; 1953, 73; 1956, 74); Freedom Party, 8 (1949, 16; 1953, 14; 1956, 6); and Communists, 0 (1945, 4; 1949, 5; 1953, 4; 1956, 3). (See also below, *Principal Events, 1959.*)

Provincial elections were held in two provinces in conjunction with the parliamentary elections. In Lower Austria the results (1954 in parentheses) were: People's Party, 31 (30); Socialists, 25 (23); and Communists, 0 (3); in Salzburg, People's Party, 14 (15); Socialists, 13 (13); and Freedom Party, 5 (4). Elections held in Vienna on Oct. 25, 1959, for the 100-seat Municipal Council produced the following results as compared with 1954: Socialists, 60 (59); People's Party, 33 (35); Freedom Party, 4 (0); and Communists, 3 (6).

Education.—Education is compulsory for all children between the ages of 6 and 14. For the first 4 years they attend the *Volksschule,* of which there were 4,309 public and 94 private schools in 1958–59. In rural areas the *Volksschulen* often continue for 4 additional years. After the first 4 years, however, the usual course is for pupils to attend either the *Hauptschule,* which offers a 4-year practical terminal course and also prepares for trade schools, or the *Mittelschule,* which prepares for the universities and higher technical schools. If a child from 14 to 18 years of age does not attend a *Mittelschule* or other specialized school, the normal procedure is to attend a trade school, usually on a part-time basis. There were 753 public and 71 private *Hauptschulen* in 1958–59. Physically and mentally handicapped children are taken care of in 115 public and 7 private *Sonderschulen* and in 369 special classes attached to regular *Volksschulen* and *Hauptschulen.* The number of *Mittelschulen* in 1958–59 was 196, of which 146 were public and 50 were supported by private organizations, chiefly by the Roman Catholic Church.

In 1958–59 (attendance at private schools in parentheses), 495,811 (12,403) pupils attended the *Volksschulen;* 185,510 (10,466), the *Hauptschulen;* and 20,250 (580), the *Sonderschulen.* Attendance at *Mittelschulen* increased by 1,245 to 85,411. In the winter semester of 1958–59, 32,608 students, of whom 10,015 were foreigners, attended the 14 Austrian institutions of higher education.

Religion.—According to the 1951 census, the religious affiliation of the population was as follows: Roman Catholic, 6,170,084; Protestant, 429,493; Old Catholic, 32,919; Greek Orthodox, 5,643; Jewish, 11,224; other, 17,450; none, 264,014; and unknown, 3,078.

Finance.—Final figures on the 1958 budget indicated that while expenditures had increased by 14% over 1957, revenues had risen by only 2%, leaving an overall deficit of 5,400 million schillings (26 schillings = $1). While gross tax receipts continued to rise during 1958, the increase was the lowest recorded since the war and amounted to 4% from direct taxes and 6% from indirect taxes. The projected 1959 ordinary budget (comparable figures for 1958 in parentheses) provided for expenditures of 37,458 (37,264) million schillings and revenues of 36,467 (36,278) million, leaving a deficit of 991 (986) million. To this should be added the extraordinary budget of 2,968 (1,707) million for investments, producing an overall deficit of 3,959 (2,693) million. An increase in tax receipts during the first part of 1959 gave hope that the final deficit would not be as large as anticipated.

Foreign convertibility of Austrian schillings was announced on Jan. 1, 1959, in line with practices inaugurated in other European countries following the dissolution of the European Payments Union. On February 17, new regulations materially cut the number of foreign exchange licenses required. Exchange rates for foreign currency are no longer controlled by the Austrian National Bank but are arrived at freely on the Vienna Exchange.

Gold reserves rose from 2,652 million schillings in January 1958 to 7,506 million in August 1959, and foreign currency reserves and savings deposits also reached new highs during 1959. On April 23, the Austrian National Bank reduced its discount rate from 5% to 4½%.

By the end of 1958 the Austrian government had floated loans totaling $52,029,263 and had guaranteed loans totaling $168,988,076 contracted by Austrian enterprises. A 100 million mark loan bearing 6% interest was successfully placed in West Germany in February; the proceeds were to be used for a power plant at Aschach. At the end of March, a 20-year $69.2 million bond issue at 7% was sold to cover investments planned in the extraordinary budget. A $6 million loan to three Austrian banks for the purchase of cotton was announced by the Export-Import Bank of Washington on June 25, and on September 25, the Austrian Investment Credit Corporation obtained from the International Bank for Reconstruction and Development a $9 million loan for industrial expansion.

Transportation and Communications.—By mid-1959, 1,106 miles of Austria's 3,740-mile railroad network had been electrified. Since this covered some of the most important stretches, nearly two thirds of the railroad service was powered by electricity.

Landings at Austria's six airports increased from 6,581 in 1957 to 8,178 in 1958. Austrian Airlines, which began regular flights in 1958, served 15 cities in 13 countries in 1959.

Austria has 55,000 miles of roads, including 5,170 miles of federal highways. About 100 miles of the 198-mile Vienna-Salzburg superhighway have been completed, and in 1959 ground was broken on two new superhighways: a north-south route that will eventually extend to Italy, and a road from Kufstein to the Brenner Pass. As of April 1959, there were 819,590 registered motor vehicles.

Freight traffic on the Danube River in Austria in 1958 totaled 5,037,616 metric tons (4,721,160 in 1957), of which 3,360,389 tons were international. Coal and coke accounted for about two thirds of the tonnage.

On Jan. 1, 1959, 49,322 television receivers were registered in Austria. New registrations average 4,000 a month.

Production.—In 1958 the Austrian gross national product totaled 128.9 billion schillings, or 5.8% more than in 1957. When allowance is made for price advances, the real increase was about 3.4%. The rate of increase was notably less than in 1957, when it had amounted to 10.1% (5.8% real) over the 1956 product. This decline in the rate of growth was due largely to the impact of the international recession on Austrian exports. The general index of industrial production (1953 = 100), excluding manufactured gas, was 150 in 1958, as compared with 146 in 1957; that of mining, 119 (124 in 1957); manufacturing industries, 152 (147); and electricity, 161 (146).

The monthly average number of unemployed rose from 113,185 in 1957 to 123,117 in 1958. In January 1959, the unemployed numbered 227,858 (209,233 in January 1958); at the end of July, 62,062 (74,170 in July 1958). At the end of January 1959, employed persons registered for sickness insurance totaled 2,215,300 (2,117,100 in January 1958); at the end of July, 2,290,400 (2,260,100 in July 1958).

Manufactures.—The 1958 output in metric tons (with 1957 figures in parentheses) of major products was as follows: pig iron and ferroalloys, 1,824,000 (1,956,000); crude steel, 2,388,000 (2,508,000); electrolytic copper, 9,600 (9,480); lead 8,880 (8,640); aluminum, 74,280 (72,840); cement, 2,154,000 (2,128,800); paper, 428,280 (432,168); cellulose, 428,416 (429,555); and woven cotton fabrics, 17,520 (16,800).

Electric Power.—The Glockner-Kaprun power group was completed at the end of 1958, when the final unit at Schwarzach went into operation. In 1959 ground was broken for a new power plant at Edling, Carinthia, and for another at Dorfertal-Huben, Tirol. Electricity production in 1958 amounted to 12,463 million kw.-hr. Austria im-

ported 659 million kw.-hr. and exported 1,900 million, leaving a balance of 11,222 million kw.-hr. for domestic consumption.

Minerals.—In 1958, Austria produced 3,410,676 metric tons of iron ore (3,495,924 in 1957); 141,048 tons of coal (151,340); 6,495,566 tons of lignite (6,877,260); 1,221,192 tons of raw magnesite (1,172,604); and 21,000 tons of crude graphite (18,000). Crude oil production declined from 3,185,616 metric tons in 1957 to 2,836,392 tons in 1958, but that of natural gas rose from 758,520,000 to 820,284,000 cubic meters in the same period.

Agriculture and Forestry.—Despite an extraordinarily cold spring and a hot, dry summer, the crop yield in 1958 was on the whole above the average for the preceding 10 years. Wine production was the largest in the postwar period, amounting to 1,897,077 hectoliters, as compared with 1,415,427 in 1957. Production of leading crops in thousands of metric tons (with 1957 figures in parentheses) was as follows: bread grains (wheat and rye), 958 (985); barley, 335 (392); oats, 333 (340); corn, 155 (149); potatoes, 3,542 (4,034); and sugar beets, 2,005 (1,655).

The wood cut declined from 11,231,085 cubic meters in 1957 to 10,240,149 cubic meters in 1958. Because of a marked decline in exports, the greatest drop was in the coniferous cut.

Foreign Trade.—In 1958 exports showed a decline principally in semifinished and finished products, while imports showed increases in finished products and a substantial decrease in raw materials. Austrian deliveries to the USSR under the agreement annexed to the state treaty amounted to 1,132 million schillings. About half of Austria's trade is with members of the OEEC (especially West Germany, Italy, Switzerland, Great Britain, France, and the Netherlands) and consisted in 1958 of exports worth 14,925 million schillings and imports worth 18,618 million. Trade with eastern Europe (in millions of schillings) was: exports, 2,966, and imports, 3,006; with the Western Hemisphere, exports, 2,123, and imports, 3,820; with the United States alone, exports were 1,777, and imports, 2,817.

Total imports in 1958 (figures for 1957 in parentheses) amounted to 27,912 million schillings (29,339), and exports to 23,864 million (25,442). By volume, imports amounted to 10,839,000 metric tons (11,738,000), and exports to 6,236,000 (6,731,000). Figures for the first 7 months of 1959, as compared with the same period in 1957, showed imports of 16,380 million schillings (16,168) and exports of 13,990 million (13,647).

On November 20, Austria joined Great Britain, Sweden, Norway, Denmark, Switzerland, and Portugal (Outer Seven countries) in initialing a convention establishing a European Free Trade Association (q.v.). It was hoped that the agreements would be ratified by March 1960 so that tariff reductions could be inaugurated on the following July 1.

Principal Events, 1959.—On March 5, under the chairmanship of Chancellor Julius Raab, the People's Party took the initiative in proposing the dissolution of Parliament, although that body was not scheduled to expire until 1960. Raab complained about the difficulty of obtaining Socialist approval for a number of parliamentary bills, notably those on public housing, the sale of stock in nationalized industries, tax concessions for small businessmen, and the implementation of a 1955 agreement with the United States for settling a dispute with American oil companies. The Socialists under the leadership of Vice Chancellor Bruno Pittermann rejected his accusations but willingly accepted the challenge for new elections. In an uneventful electoral campaign the People's Party relied on a slogan of "prosperity and security," while the Socialists charged that their opponents wanted to end the coalition regime which had governed Austria since the war and proceed along the authoritarian road taken in the interwar period.

In the elections held on May 10, 94% of the electorate participated, as compared with 96% in 1956. The results of the popular vote (1956 figures in parentheses) were as follows: Socialists, 1,953,935 (1,873,295); People's Party, 1,928,043 (1,999,986); Freedom Party, 336,110 (283,749); and Communists, 142,578 (192,438). Despite their larger popular vote the Socialists received one parliamentary seat less than the People's Party, and for the first time the Communists won no mandate. On May 12, Chancellor Raab submitted the resignation of his government, but the cabinet agreed, at President Adolf Schärf's request, to function as a caretaker government. Negotiations for the formation of a new cabinet were the most protracted in postwar history, and the president played a more important role than usual in bringing about the final coalition cabinet sworn in on July 16. (See also page 70, the section on *Government.*)

Relations with Italy were affected by the question of the South Tirol (Alto Adige). On February 11 the Italian government refused to permit several Austrian officials of the Province of Tirol to visit Bolzano (Bozen) in order to participate in festivities commemorating the 150th anniversary of the Tirolean uprising against Napoleon. The refusal led to *démarches* and counter *démarches* by the Italian and Austrian governments, which were the prelude to a series of protests and statements on both sides throughout the year. The Austrian government charged that Italy was not living up to the 1946 Austro-Italian agreement on the South Tirol. Particular grievances were that the German-speaking element was being crowded out by Italians, that it occupied almost none of the apartments built with public funds, and that administrative services and courts were staffed approximately 90% by Italian-speaking citizens. The Austrians, who favored autonomy for the Province of Bolzano, brought up the South Tirol question at the 10th anniversary meeting of the Council of Europe in April and during the general debate of the U.N. General Assembly on September 21. Speaking two days later, Italian Foreign Minister Guiseppe Pella rebuked Austria for attempting to raise a "domestic question" in the United Nations. Meanwhile, a large Tirolean protest parade was held in Innsbruck on September 13. (See also ITALY.)

A rally of 300,000 Sudeten Germans was held in Vienna on May 16–18. Both before and after the meeting, Czechoslovakia protested to the Austrian government that permitting the gathering on Austrian soil was an unfriendly act toward Czechoslovakia and one inconsistent with Austria's policy of neutrality. In its reply of June 7, Austria rejected the protest and charged that Czechoslovakia was attempting to intervene in its internal affairs. The Communist-sponsored International Youth Festival took place in Vienna on July 26–August 4 and, despite some open differences, went off without serious mishap.

Among visits by prominent Austrians during the year was that by Vice Chancellor Pittermann to the United States, on February 7–21. He was followed on June 2–19 by Franz Cardinal König, who was awarded an honorary degree by the University of Notre Dame. President Schärf paid a state visit to the USSR on October 5–15, and from October 17 to November 25 the Vienna Philhar-

monic Orchestra under the direction of Herbert von Karajan made a world tour.

AUTO RACING. See SPORTS, GAMES, AND SHOWS.

AUTOMATION. See Index entry.

AUTOMOBILES. The year 1959 featured a big "turnabout" in the type of car produced by the automobile industry. Although sales of new cars showed a 32% gain during the first eight months of 1959, soaring small car registrations forced the big three makers to introduce smaller economy cars—the Chevrolet rear-engine Corvair, the Ford Falcon, and the Chrysler Valiant.

Ever since World War II, American automobiles have increased annually in length, width, and horsepower. Parking and road space became a growing problem, and initial costs of the cars rose steadily while mileage per gallon dropped and gasoline prices rose. Even as small imported cars grew in popularity, success of American Motors' Rambler and Studebaker-Packard's Lark presented a real challenge to the major manufacturers. Long-dormant plans for compact cars were dusted off, engineering work was rushed, and the big three's small, economy models were brought out at the start of the 1960 model season.

Initial success of the smaller cars seems assured, but it is expected that lack of sufficient productive capacity will not permit a real test in sales popularity of the compact models for at least a year. Meanwhile, the big three firms rushed plans for introduction of compact cars in their medium-priced lines during 1960.

Production.—While the number of cars on United States highways rose by 2.06% to 52,500,000, production of new cars fell to 4,244,021 in the calendar year 1958, a 30% drop and the lowest output since 1948. However, with start of production on 1959 models in the fall of 1958, output began a slow rise, and production of 1959 models totaled 5,566,527 cars, topping the 1958 model output by 32%. The biggest gains were shown by Rambler, Ford, Pontiac, and Lark, in that order.

However, due to the shortage of steel resulting from the effects of the steel strike in 1959, most automobile manufacturers were forced to curtail production in the fall of the year. General Motors closed down its passenger car production lines completely on November 19 for one month, and Chrysler Corporation and Ford Motor Company instituted short workweeks in their plants in the same period. The steel shortage, coupled with poor sales, caused Ford to discontinue production of its Edsel line on Nov. 19, 1959. Total output of Edsel cars and station wagons, which were first produced in 1957 and cost an estimated $250 million to develop, was 110,738.

The big three producers turned out 5,060,910 cars during the 1959 model year (July 1958 to September 1959), or 90.92% of the total output, compared with 93.92% in the previous year. General Motors divisions contributed 2,673,617 cars, or 48.03% of the total; Ford Motor Company, 1,683,937, or 30.25%; and Chrysler Corporation, 703,356, or 12.64%. In the previous model year, General Motors accounted for 50.37% of the total; Ford, 28.75%; and Chrysler, 15.80%. Chevrolet led Ford for the top spot in the 1959 model year by a narrow margin of about 19,000 cars, producing 1,481,071 to Ford's 1,462,140.

The so-called independents boosted their market penetration by 4 percentage points, American Motors accounting for 6.72% of the 1959 model output and Studebaker-Packard accounting for 2.36%.

Six-cylinder engines continued to make a comeback during the 1959 model year, accounting for 23.75% of all sales, a gain of 6.27 percentage points over the previous year. Eight-cylinder cars, however, maintained a wide lead by accounting for 76.25% of all cars produced. This picture should change radically during the 1960 model year with anticipated increased production of the big three's compact cars, all of which have six-cylinder engines.

While the public was exhibiting economy-mindedness in purchasing six-cylinder cars in 1959, customers were also buying optional equipment such as power steering, power brakes, and power seats at record-breaking levels.

U.S. PASSENGER CAR PRODUCTION, 1958–59

Company and make	1958 (Jan.–Sept.)	1959 (Jan.–Sept.)
American Motors Corporation		
Rambler	136,053	291,551

Foreign Cars.—Heading for 1959 total sales of 600,000, imported car registrations had passed the 400,000 mark by September 1, with an overall penetration of 9.62% of the United States market. By the same date in 1958, foreign makes had recorded 377,548 sales in the United States, or 7.25% of the total market. Foreign car sales penetration passed 10% for the first time during 1959 in August, but was still below the record 11.96% penetration established in October 1958.

Another significant development in August 1959 was the fact that sales of the top three imported cars excluded the so-called "captive" makes for the first time. These captives are Opel, English Ford, Simca, and Vauxhall, which are produced abroad by the United States big three and distributed in the United States by big three dealers.

For the first eight months of 1959, Volkswagen led the foreign car field with 74,117 registrations in the United States, followed by Renault with 55,807, English Ford with 29,617, Opel with 26,474, and Fiat with 25,950.

There were more than one million foreign cars on American roads as of July 1, 1959, according to *Automotive News* estimates. The number of imported car franchised dealers totaled 23,172, compared with 20,344 in July 1958.

The 1959 Cars.—Studebaker-Packard entered the

compact car field with the introduction of its 108-inch wheelbase Lark series, while all General Motors divisions—Buick, Cadillac, Chevrolet, Pontiac, and Oldsmobile—offered completely new designs for 1959. Distinctive design changes were made by Chrysler Corporation, Ford Motor Company, and American Motors.

To cover a wider field, most makers offered more economical and more powerful engines. Some wheelbases were shortened, others were lengthened. More glass area was featured, with Ford, Mercury, Edsel, and the General Motors makes adopting the Chrysler-type wrap-over windshields. Fins were still prominent, and exterior finishes were improved through the use of new lacquers giving longer-lasting gloss. Chrysler cars offered swivel seats, which swing out to facilitate entry and exit. Rambler featured individually adjusted front seats and front-seat headrests.

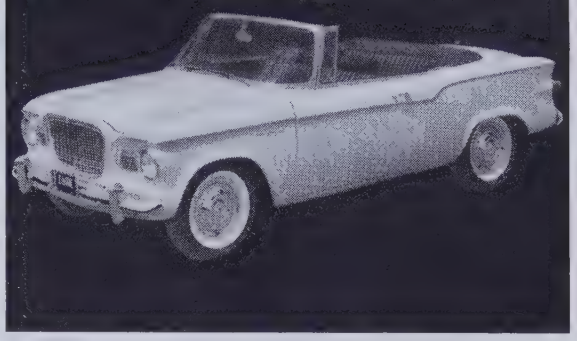
Prices were raised an average of 2.68% on 1959 models, which was well below the 3.35% boost on 1958 models and the 7.17% increase on 1957 cars.

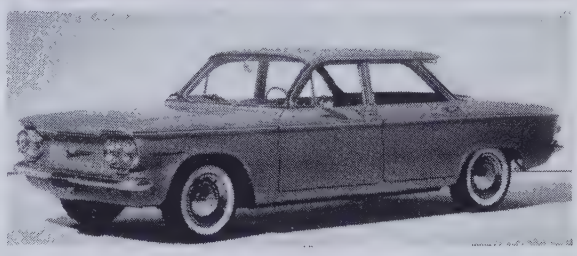
The number of models offered dropped to 237 in 1959 (Packard's entire line was abolished), compared with 267 models available in 1958. Station wagons headed the list with 52 selections. There were 48 four-door sedans, 44 four-door hardtops, 22 two-door sedans and coupes, and 31 convertibles available.

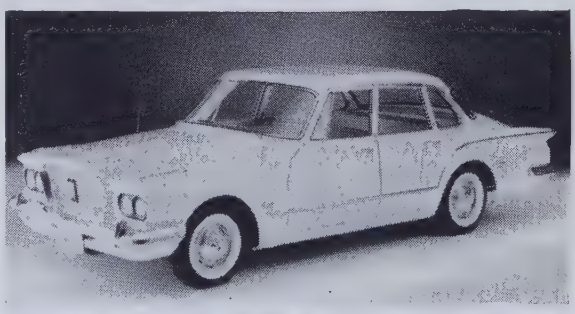
Engineering.—New engines and redesigned engines capable of increasing gasoline economy topped the list of engineering advancements on the 1959 models. Other economy measures included models that operated on regular gasoline, engines that required less oil or fewer oil changes, brakes that demanded less frequent relining, mufflers that needed less frequent replacement, paints that called for less polishing, and engines that required less coolant.

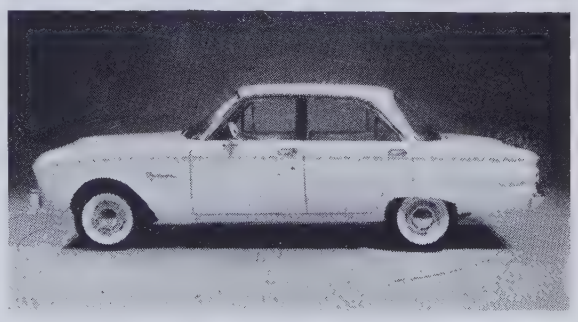
Chrysler offered a torsion-air suspension system, with automatic leveling of the car. Ford featured a nonslip differential and a new two-speed automatic transmission. Pontiac presented a wider tire tread to improve stability. Mercury reduced the size of its transmission tunnel by one half.

Air suspension, which had become a feature of









(Right) **New small American automobiles in 1959 were (top to bottom) Studebaker's Lark, Chevrolet's Corvair, Chrysler's Valiant, and Ford's Falcon. *(Below)* At dockside in Port Newark, N.J., some of the 600,000 European automobiles sold in the United States in 1959 await shipment.**

THE NEW YORK TIMES

several makes during the year, was put on the shelf by the end of the 1959 model year, and only Cadillac still offered it on its 1960 models. Lagging sales, high costs, and inability to furnish a better ride compared with steel springs were given as reasons for its discontinuance.

New seven-inch sealed-beam headlights were adopted during the year by all makers. First offered in 1939, the new sealed-beam lamp is said to provide greater seeing distance on low beam and better light at the side of the road.

WORLD MOTOR VEHICLE PRODUCTION, 1958

	Passenger cars	Trucks	Buses	Total
United States	4,247,427	870,803	3,039	5,121,269
Canada	298,349	60,857	571	359,777

World total	8,685,724	2,560,139	43,173	11,289,036

Note: The data shown above for some countries represent assemblies rather than production. To the extent that some of these assemblies were partly or wholly produced in another country, the world total will include some duplication.

[1] Includes utility vehicles under 1 ton. [2] Includes 98,896 three-wheeled vehicles. (Source: Automobile Manufacturers Association.)

World Motor Vehicle Registration.—The world's number of registered automobiles, trucks, and buses increased 4.64% in 1958 to total 113,024,224 as of Jan. 1, 1959. The United States accounted for 60.4% of the total. Registrations in Asia increased 21.8% during 1958 and represented the greatest regional gain. The table in the next column gives a breakdown of the world's motor vehicle registrations by principal areas.

Miscellany.—Chrysler Corporation merged its Plymouth and DeSoto divisions for sales purposes in 1959, but continued to produce both cars. All corporation divisions were given back their sales responsibilities, after several months of centralized control.

Ford Motor Company entered the automobile financing field after Congress failed to act on pleas of independent finance firms to bar car makers, such as General Motors Acceptance Corporation, from this field.

WORLD MOTOR VEHICLE REGISTRATION, Jan. 1, 1959

Area	Passenger cars	Trucks	Buses	Total
Canada	3,572,963	1,036,483	14,175	4,623,621
United States	56,870,684	11,158,561	270,163	68,299,408

(Source: U.S. Department of Commerce.)

The Automobile Information Disclosure Act, which went into effect on Oct. 1, 1958, and requires manufacturers to affix a tag showing the breakdown of a car's price on a rear window, was hailed on its first anniversary for its effect in restoring customer confidence and dealer integrity.

The National Automobile Dealers Association laid plans for a code of ethics for new-car dealers, covering advertising, merchandising, and service responsibilities of both dealers and makers.

General Motors realigned a number of its executives, giving Louis C. Goad, executive vice president, jurisdiction over all general staff activities. Two new executive vice presidents were named: Sherrod E. Skinner, who assumed Goad's former duties as head of automotive, body, and assembly divisions; and Cyrus R. Osborn, who heads the engine and appliance divisions.

Production of new cars by states during 1958 was distributed as follows: Michigan, 29.18% of the total; California, 9.58%; Wisconsin, 9.05%; Missouri, 8.67%; and New Jersey, 6.83%.

The number of new-car dealerships in the United States dropped from 37,620 in 1958 to 35,774 in 1959. In 1948 the number was 46,092.

Editor, Automotive News.

AVIATION. See AERONAUTICS.

AWARDS. See PRIZES AND AWARDS.

AZORES or **WESTERN ISLANDS.** A group of 9 main islands and several islets in the Atlantic about 800 miles off the Portuguese coast, comprising three districts of Portugal. Area, 890 square miles; pop. (1950 census), 317,409. Ponta Delgada (22,706), the chief city of the group, is on São Miguel Island, the largest of the islands. Agriculture is the chief occupation. Manufactures include wines, linens, woolen garments, and embroideries. The Azores serve as a transatlantic cable station and a stopping point for aviation. A United States–Portuguese agreement of 1957 extended to 1962 the United States right to use Lagens Airfield, on Terceira, as a communications base.

BACTERIOLOGY. Knowledge in this science increased in 1959 as a result of an estimated 3,000 to 4,000 research articles, books, reports, and educational films. Examples of findings and developments in major areas follow.

Agriculture.—Nitrogen-fixing bacteria of the soil were found to supply only about one half of the total nitrogen demands of legumes; thus the addition of nitrogen fertilizer will aid such crops. Decomposition of organic matter in soils by microorganisms is influenced by oxygen, but 5 per cent oxygen is almost as effective for this purpose as the 21 per cent which exists naturally in the air.

New information has become available on the mechanism of infection of sweet potato roots by molds, and of white potato tubers by the organism (actinomycete) causing scab. The spread and control of fungus diseases of plants, such as downy mildew of onion and powdery mildew of lettuce, have been studied.

Better understanding of virus diseases of plants

resulted from new assay methods for the alfalfa mosaic virus, correlation of woody decay of grape vines with a leaf virus, and demonstration that whiteflies transmit leaf crumple virus of cotton. Studies also were made on the viruses causing white tip disease of rice, necrosis of cherry leaves, latent infection in carnation, chlorosis in barley and cucumber, and tobacco and wheat streak diseases.

In ruminants, food is subjected to microbial fermentation in the rumen before it passes on to the true stomach. The bacteria responsible for feed-lot bloat have been discovered in the rumen of cattle.

Industry.—Microbiological studies in grain processing plants, bakeries, and other food manufacturing establishments have resulted in prevention of bacterial contamination of precooked frozen dinners, meat pies, frozen desserts, and related foods.

Bacteria play a useful role in the production of flavor in certain cured meats, and recently the specific reactions involved have been elucidated. The bacterium responsible for a malodorous fermentation of brines of olives used for making canned ripe olives has been identified, and steps have been taken to eliminate this fermentation. Also, new bactericidal and algicidal agents are available for use in swimming pools.

General Research.—Observations on ultrathin sections of microorganisms under the electron microscope have revealed new information on the basic structure of cells. (See also BOTANY.) For example, the capsules of virulent and avirulent anthrax bacilli appear to be different in that the capsule from pathogenic strains is electron-transparent and has a well-defined edge, whereas nonpathogenic strains have an electron-dense capsule with a poorly defined edge. The stages in the development of the spore wall during sporulation in bacteria, and during cell division, conjugation, and sporulation in yeasts, have been followed by observing sections of the organism under the electron microscope.

Microorganisms are excellent subjects for genetic studies because large populations can be handled and selective techniques applied for detection of mutants and recombinations. In 1959, hybrids were obtained from the conjugation of the colon bacillus (*Escherichia coli*) and the typhoid bacillus (*Salmonella typhi*). Analysis revealed one hybrid that exhibited most of the cultural and biochemical characteristics of the *E. coli* parent, but it reacted with antiserum to both *E. coli* and *S. typhi*. Genetically active material (deoxyribonucleic acid, or DNA) has been found extracellularly in the slime or capsule surrounding the meningococcus. Staphylococcal bacteriophages have been shown to transfer resistance to antibiotics from one staphylococcus culture to another. (See also GENETICS.)

For years interest has centered around the metabolic pathways followed in the utilization of carbohydrates by microorganisms. Such studies continued during the past year, but major emphasis was on the metabolism of nucleic acids and steroid hormones of the testosterone and progesterone series. Fundamental information on the microbial metabolism of hydrocarbons may eventually lead to the prevention of deterioration of numerous petroleum products.

Medical Bacteriology, Immunology, Virology.—Pathogenic activities of microorganisms have been observed generally in the past in laboratory animals. Recently, artificially cultured tissues have been used with great success for the study of organisms with fastidious requirements. In 1959 this technique was employed to determine the cytopathology of numerous bacteria, including the leprosy bacillus. The leprosy organism had not been cultured previously on artificial media; but when leprous tissues were introduced into human tissue culture preparations, the organism grew and could be studied for 60 days, although serial passage to fresh tissues was impossible.

Immunological methods, such as the fluorescent antibody and gel-diffusion techniques, have been used to demonstrate a variety of antigens in microorganisms. These methods will aid in more rapid diagnosis of such diseases as plague, mumps, spotted fever, and amebic dysentery.

Great progress has been made in the cultivation and identification of viruses, as well as in learning how these parasites invade host cells. Several viruses contain ribonucleic acid (RNA), and others, deoxyribonucleic acid (DNA); none is known to contain both. It appears that the nucleic acid of the virus particle initiates synthesis of new virus in a susceptible host cell. But recent results show that ribonucleic acid of the host cell also plays a role in multiplication of fastidious viruses which contain only deoxyribonucleic acid. Thus, certain strains of Type II polio virus multiply in fertile chicken eggs, whereas Type I polio virus does not. However, if Type I virus and ribonucleic acid (isolated from Type I virus) are both introduced, the eggs are then stimulated to produce this type of virus.

BAHAMAS. This archipelago (land area, 4,404 square miles), consisting of some 20 inhabited islands and 661 uninhabited coral keys, extends for nearly 700 nautical miles southeastward from the coast of Florida between Cuba and the open Atlantic. Though geographically part of the West Indies, the Bahamas remain a separate British colony and do not belong to The West Indies federation (q.v.). Their population (82% Negro) was estimated in 1958 at 136,220. Nassau (pop. est., 50,405 in 1958), chief port of the island of New Providence, is the capital. Other principal islands (with 1953 census populations) are Andros (7,136), Eleuthera (6,070), Grand Bahama (4,095), Long (3,755), Great Abaco (3,407), Cat (3,201), Exuma (2,919), and Acklin's (1,273). Joint naval and air bases and a research station are maintained by the United States and Great Britain.

Government.—The governor (Sir Oswald Raynor Arthur, sworn in on April 1 1957) is assisted by an 8-member Executive Council and a 9-member Legislative Council. Following an 18-day strike of Negro taxi drivers and hotel employees in 1958, universal male adult suffrage and other reforms affecting elections to the 29-member House of Assembly were promised. A property qualification for voters previously had effectively restricted to 6 the number of Negro representatives in the assembly. Prince Philip, Duke of Edinburgh, husband of Queen Elizabeth II, visited the colony on April 25, 1959, in the course of his 100-day global tour.

Finance.—Government revenue in 1958 was £5,198,975, falling short of preliminary estimates by £442,025; expenditure at £5,434,533 also was lower than the estimate (£5,679,903). British currency is legal tender, but United States and Canadian currencies also are in circulation.

Education.—Education is free and compulsory at the primary level. In 1958 there were 145 government schools (enrollment, 16,824) and 45 denominational and private schools (enrollment, 5,087 in 1957). Government expenditure on education totaled £356,946 in 1957.

Transportation and Communications.—There are no railways. On New Providence, 218 miles of public roads (141 miles asphalted) are open to motor traffic, and good roads are maintained on Eleuthera and Grand Bahama.

Overseas air service is furnished to the Nassau International Airport by Pan American World Airways (from Miami, Fla., and New York), Mackey Airlines (from four Florida cities), British Overseas Airways Corporation (from New York, London, Jamaica, and Bermuda), Eagle Airways (from New York), and Trans-Canada Air Lines (from Montreal and Toronto, Canada, and Kingston, Jamaica). Bahamas Airways provides scheduled service within the islands. Nassau, which is linked by radiotelephone to all major islands, had 8,685 telephones in use in 1958; six radiotelephone circuits with the United States furnish worldwide service.

Tourism and Foreign Trade.—Income from the tourist trade has exceeded $20 million in recent years but was somewhat lower in 1958 because of the strike on New Providence; 177,687 tourists visited the Bahamas, compared with 194,618 in 1957. In the first 6 months of 1959 there were 147,781 visitors. Two new major hotels, providing accommodations for over 4,500 visitors, were completed in 1958, and a third was opened in 1959.

Trade is chiefly with the United States. Imports, valued in 1958 at £16,489,394 (in 1957, £15,237,255), included apparel (£612,672), motor cars and trucks (£654,052), fresh meats (£611,148), machinery (£32,610), cement (25,600 tons), and nitrogenous fertilizers (562 tons). Exports, totaling £1,711,064 (in 1957, £1,376,863), were chiefly pit props and other lumber (£21,588), crayfish (rock lobster, £154,943), and salt (£156,021).

BAHRAIN. See ARABIA.

BAKING INDUSTRY. The baking industry in the United States ranks among the highest of the food industries in value of products, and had gross sales valued at nearly $6 billion in 1958. The nation's bakery foods are produced commercially by some 6,000 wholesale establishments and 12,000 retail bakeries. Retailers do about 20% of the total volume and the individual store has an average weekly gross of $1,600. The retail price of white bread averaged 19.6 cents per pound in 1959, compared with 19.1 cents in 1958. Bread volume in 1958 was 10% above the average for 1954, the last census year. The industry operates about 80,000 trucks, most of which are 1½ tons or less.

U.S. BAKED GOODS PRODUCTION[1]
(In thousands)

Category	Pounds (1954)	Value (1954)	Value (1958)
Bread and rolls	13,674,860	$2,198,441	$3,329,000
Sweet yeast goods	642,610	233,923	
Soft cakes	1,034,748	372,385	
Pastries	...	30,029	1,797,900
Pies	692,633	185,900	
Cookies	52,385	24,219	
Doughnuts (baking powder)	344,692[2]	120,834	

[1] Except by single retail shop bakeries. Sales by this branch of the baking industry were estimated to be $1,014,000,000 in 1959. [2] Dozens.

Employees number 320,000 persons, including 247,000 in the wholesale branch and 73,000 in retail. The average wage rate is over $2 per hour, plus fringe benefits which average 27% of payroll costs.

Bakers are the farmer's biggest customers, purchasing annually over $2 billion of raw materials. They use over one third of the nation's wheat crop in the form of flour, spending over $706,000,000 for this one item alone. Freezing of bakery foods continued to make rapid strides in 1959; sales have increased 240% during the four-year period, 1955–58.

The American Institute of Baking in Chicago is the scientific and educational center of the industry. It maintains research laboratories, test bakeries, a huge baking library, consumer and sanitation departments, and a school of baking. A number of vocational schools throughout the country also have courses in baking.

Editor, "Bakers Review."

Outgoing Mayor Thomas D'Alesandro (r.) raises hand of Democrat J. Harold Grady after latter defeated ex-Governor Theodore R. McKeldin in Baltimore mayoralty contest, May 5.

WIDE WORLD

BALANCE OF PAYMENTS, U.S. See INTERNATIONAL TRADE.

BALEARIC ISLANDS. An archipelago in the Mediterranean Sea east of Spain, forming a Spanish province. Area, 1,936 square miles; pop. (1957), 433,347. The four largest islands are Mallorca, Menorca, Ibiza, and Formentera. Palma (146,461), the capital, is on Mallorca. Fruits, almonds, and olives are grown, and handicraft items are produced. A flourishing tourist trade, especially on Mallorca, provides an important source of income.

BALKAN STATES. The states of the Balkan Peninsula, which comprises the region of Europe south of the Danube and Sava rivers between the Black Sea and the Adriatic Sea. Politically, the Balkan States include Yugoslavia, Albania, Greece, European Turkey, Bulgaria, and Rumania. (See separate articles on the Balkan countries.)

BALLET. See DANCE.

BALTIC STATES. The states of Estonia, Latvia, and Lithuania, on the east coast of the Baltic Sea of northeastern Europe. The Baltic States were incorporated into the Soviet Union in 1940 as member republics. (See UNION OF SOVIET SOCIALIST REPUBLICS, and articles on each of the Baltic States.)

BALTIMORE. Maryland's dominant metropolis, Baltimore is the sixth most populous city in the United States. It has a land area of 78.7 square miles and in 1950 had a population of 949,708. Baltimore City is the center of a rapidly growing metropolitan area which includes Baltimore and Anne Arundel counties, totaling 1,106 square miles and having a 1950 census of 1,337,373. Population estimates at mid-1959 were 985,000 for the city and 1,615,200 for the metropolitan area.

The principal sources of Baltimore's economic strength come from the excellent port facilities and diversified manufacturing plants. Leading industries (in terms of value added by manufacture) are primary metals, transportation equipment, food and kindred products, fabricated metal products, and chemicals.

Data for Baltimore City in 1958: nonagricultural employment averaged 589,100 workers, 17,400 under the all-time peak of 1957. Department store sales index (1947–49 = 100), 124.7. Freight carloadings, 224,563, and vessel arrivals, 5,615. Output of electricity, 5,456,396,000 kw.-hr.,

and sales of gas, 35,507,700,000 cubic feet. Cost-of-living index, June 1959 (1947–49 = 100), 126.6.

The government of Baltimore City combines city and county functions. The city is governed by a mayor and 21-member City Council elected on a party basis for four-year terms. Additional elective officers include the comptroller and the City Council president. Mayor J. Harold Grady, Democrat, began serving his first term in 1959.

The net long-term debt (Jan. 1, 1959) was $309,545,800, representing an increase of 88% in a 13-year period. The property tax rate in 1959 was $3.34 per $100 on a total assessable basis of $3,550,254,778. The 1959 budget totaled $329,998,503 for current and capital expenses.

In the Democratic primary of March 3, Mayor Thomas D'Alesandro was defeated by a 33,000-vote margin by J. Harold Grady. D'Alesandro was making a bid for an unprecedented fourth straight term as mayor. In the general election on May 5, J. Harold Grady defeated former Gov. Theodore R. McKeldin, the Republican nominee for mayor. Grady received 154,786 votes to 73,229 for McKeldin. Dr. Walter Graham was re-elected comptroller, and Philip H. Goodman was elected president of the City Council. In the race for the City Council, the 20 successful Democratic candidates polled a total of 505,690 votes in the city's six councilmanic districts.

In order to meet the city's growing financial difficulties Mayor Grady proposed a 1% earnings tax on the incomes of both individuals working and businesses conducted within the city. The mayor asked Gov. J. Millard Tawes to call a special session of the General Assembly to act on the proposal, but the governor declined on the ground that the proposal would not pass without amendments.

Governor Tawes named 25 community leaders to the Permanent Commission on Municipal Courts. The commission's first objective is to help obtain a favorable vote on a constitutional amendment in 1960 which proposes to abandon the present appointive system for magistrates in favor of election of 11 judges for 10-year terms, after initial appointment by the governor.

The new Grady administration introduced an austerity program in the city's administration and indicated that the 1960 budget would be forced to reject almost all requests for expansion of city services until additional sources of revenue can be secured for the city.

BANANAS. See FRUITS.

BANKING. United States.—The Federal Reserve banks in 1959 maintained a policy of credit restraint which had been adopted in a mild form at the start of business recovery in the second half of 1958.[1] This policy reflected a substantial increase in demand for credit by consumers, business, and government in an economy undergoing vigorous expansion—a change which threatened a resumption of inflationary price tendencies (see COST OF LIVING).

An indication of credit restraint was the increase in the discount rate, which the Federal Reserve banks charge on loans to commercial banks (Reserve members), from 2½% to 3% in March, to 3½% in May–June, and to 4% in September—the highest rate since early 1932. The Reserve banks' open-market transactions in government securities also reinforced the policy of credit restraint. Their purchase and holdings of such securities declined about $1 billion in the early part of 1959, and later increased only slightly above the level which obtained at the end of 1958.

These increases in security holdings usually offset only in part the drains of member banks' reserves resulting largely from expanded use of currency in trade and the export of gold to settle deficits in international transactions. Consequently, with the expansion of business loans (and deposits to the borrowers), member banks, in order to maintain their required reserve positions, increased substantially their borrowings at the Reserve banks. These on the average exceeded greatly the total of their excess reserves.[2] For instance, the borrowings of member banks at the Reserve banks in the June–August 1959 period averaged more than $900 million, or about $500 million more than their average excess reserves.

In the implementation of the policy of credit restraint the Board of Governors of the Federal Reserve System did not change the reserve requirements of the member banks. These remained at 18%, 16½%, and 11%, of demand deposits for central reserve city banks, reserve city banks, and country banks, respectively; and at 5% of time deposits for all member banks, the board's legal range of change for the latter being 3 to 6%.

Congressional legislation in July 1959, however, altered some features of the reserve requirements. The board was authorized to permit member banks to treat vault cash (almost $2½ billion in currency and coin at the end of June) as reserves—a permission which was likely to be granted on a gradual basis. It was also authorized to set reserve requirements in a range from 10 to 22% of demand deposits for member banks in central reserve cities and in reserve cities, instead of in the prior ranges of 13 to 26% for the former and 10 to 20% for the latter. Moreover, the board was authorized to permit a member bank located in a central reserve or reserve city to carry lower reserves than other banks in the same city, depending on the nature of the bank's business rather than, as previously, on its geographical location. Termination of the classification "central reserve city" was provided for at the end of three years. No change was made in the board's authority to set reserve requirements in a range from 7 to 14% of demand deposits for members classified as country banks. In the main, the new legislation was designed to enable the Board of Governors to develop more flexible and equitable arrangements for member banks, varying greatly in size and nature of business, to meet reserve requirements.

The combination of positive actions by the Reserve banks in restricting the availability of credit

[1] Statistics of banks in the United States are published monthly in the *Federal Reserve Bulletin* by the Board of Governors of the Federal Reserve System. The board, appointed by the president of the United States with the consent of the Senate, has extensive powers of control over the 12 (regional) Federal Reserve banks and the member banks. The Federal Reserve System, in its control of note issue (currency) and bank credit, operates virtually as a single central bank. Stock of Reserve banks is privately owned by member banks, but their functions are prescribed by federal law. As of January 1959 the total number of "all banks" was 14,030, consisting of 13,512 commercial banks (accepting deposits subject to check or withdrawal on demand) and 518 mutual savings banks. Of the total of "all commercial banks," nearly half (6,302) were members of the Federal Reserve System and accounted for about 85% of all commercial bank loans and investments.

[2] Member banks are required to maintain minimum deposits or balances at their respective Federal Reserve bank. These "required reserves balances" are measured as a percentage of the member bank's deposit liabilities to customers, and vary with the type of deposit (demand or time) and the nature of the bank's business and classification. "Excess reserve balances" are member bank deposits maintained at the Reserve banks in excess of the required minimum. "Borrowings" of member banks (usually in the form of advances by the Reserve banks against promissory notes of members secured by government securities) indicate the extent to which some banks, not holding excess reserves, have borrowed temporarily to meet minimum reserve requirements.

and increasing its cost to member banks, and of increasing demand for credit by business, government, and consumers, brought interest rates of leading commercial banks on prime loans from 4 to 4½% in May 1959, and to 5% in September. Such prime rates applied to the banks' biggest customers with the best credit rating; other commercial lending rates were scaled upward from the prime rate. The U.S. Treasury also borrowed at higher rates, the open-market yield on three-month Treasury bills rising from slightly less than 3% in the January–May period to about 4¼% in October —the highest level since the bank shutdown of 1933.

Appreciable changes occurred in commercial bank credit (loans and investments of all commercial banks). It declined in the first part of 1959, as is usual following the peak of selling during the Christmas season. Although banks increased their loans substantially, they reduced their investments in federal government securities in meeting loan demands; nonbank holdings of government securities increased. Later, commercial bank credit expanded and at the end of the third quarter was about $2.6 billion greater than at the beginning of the year. In the fourth quarter of 1959, commercial bank credit was expected to expand moderately without any appreciable increase in the level of interest rates.

Loans.—Total loans of commercial banks increased about $5 billion in the first half of 1959, slightly more than in the comparable period of any other postwar year. In the first quarter seasonal repayments of business and security loans approximately offset expansion in other types of loans, so that the total increase occurred entirely in the second quarter when renewed business-loan expansion was added to record increases in real estate and consumer loans. At midyear, business loans showed an increase of about $1.7 billion; real estate loans, about $1.5 billion; and consumer loans, nearly $1.5 billion. This general pattern of increase continued in the third quarter, when total loans of commercial banks expanded about $3.4 billion—a level approximately $9.6 billion higher than at the beginning of the year.

Investments.—Total investments of commercial banks decreased about $7.0 billion in the first three quarters of 1959. Practically all of the reduction occurred in holdings of United States government securities—a heavy proportion of commercial banks' investments since the great growth in the federal government's debt during World War II. Other security holdings (for example, corporate, state, and local government securities) increased only slightly. The reduction in investments, particularly in government securities, as earning assets of the commercial banks was made in order to expand the more profitable assets of commercial loans. Since the loan expansion tended to increase demand deposits (the form in which a bank loan is usually extended), and hence the amount of required reserves, the sale of investments increased the banks' reserves and loan capacity.

ASSETS AND LIABILITIES OF ALL BANKS IN THE UNITED STATES

(In millions of dollars)

Item	Aug. 27, 1958	Aug. 26, 1959
Assets		
Loans and investments:		
Loans	$116,390	$131,970
U.S. government obligations	73,510	67,570
Other securities	25,840	26,240
Total loans and investments	$215,740	$225,780
Cash assets	42,110	42,150
Other assets	4,850	5,080
Total assets	$262,700	$273,010
Liabilities and Capital		
Deposits:		
Interbank	$ 16,530	$ 14,810
Demand:		
United States government	5,490	6,020
Other	116,830	121,490
Time	96,090	100,230
Total deposits	$234,940	$242,550
Other liabilities	6,220	7,760
Total capital accounts	21,540	22,700
Total liabilities and capital	$262,700	$273,010

(Source: Board of Governors of the Federal Reserve System.)

Deposits and Currency.—Demand deposits (adjusted) and currency outside banks (held by businesses and individuals) declined less than the usual seasonal amount in the first half of 1959. On a seasonally adjusted basis, this active money supply increased approximately $1.5 billion in the first half, and reached a total at the end of the third quarter about $1.1 billion greater than at the beginning of the year. Demand deposits, comprising about 80% of the active money supply, accounted for $0.9 billion of the increase in the first three quarters. In the same period the annual rate of turnover of demand deposits (seasonally adjusted), as indicated by 337 reporting centers in leading cities other than the seven largest financial centers, showed an appreciable increase—a change reflecting substantial recovery in business operations. In general, holders of money balances used them more actively.

Time deposits in the first three quarters of 1959 increased about $3.2 billion, a moderate increase as compared with the similar period of 1958. The bulk of the increase ($2.5 billion) was accounted for by commercial banks—holders of about 65% of time deposits. Mutual savings banks' deposits increased very moderately ($0.8 billion), and the relatively small deposits of the Postal Savings System declined slightly ($0.1 billion), as in previous years.

Insurance of Bank Deposits.—The Federal Deposit Insurance Corporation (FDIC)[3] made small disbursements in the first half of 1959 to protect depositors (about 1,450) in two insured banks. The FDIC made the insured deposits immediately available when the banks were placed in liquidation by the state banking authorities. The deposit claims amounted to approximately $1 million, and it is estimated that $0.7 million will be recovered by the FDIC. At the end of June 1959, the FDIC's assets totaled $2,172.2 million; the liabilities, $145.5 million; and the insurance fund (excess of assets over liabilities), $2,026.7 million.

Canada.—The acceleration of economic recovery in Canada in 1959 increased the demand for commercial bank credit, but its expansion was very moderate (about $102 million in the first three quarters) because of the restrictive credit policy of the Bank of Canada—the government-owned central bank.[4] Although loans of the commercial or chartered banks (9 large banks with about 3,900 branch offices under central bank control) expanded substantially, their investments were reduced in order to meet reserve requirements. In general, the Bank of Canada did not assist the banks in meeting these requirements by open-market purchase of government securities. At the end of September 1959, the Bank of Canada's holdings of government obligations showed little change from the beginning of the year; holdings of Treasury bills increased about $261.3 million, and those of other Canadian government securities decreased about $211.8 million.

In these circumstances, the price of government securities declined and the open-market yield (or interest

[3] The FDIC is owned jointly by the U.S. Treasury and the Federal Reserve banks. All Federal Reserve member banks are required to insure deposits; other banks may participate. An insurance fund is provided by annually assessing each insured bank at the rate of 1/12 of 1% of its total deposits. Individual deposits in an insured bank are insured up to $10,000. In mid-1959 more than 95% of all banks (13,102 commercial banks and 251 mutual savings banks) in the United States were insured by the FDIC, and approximately 57% of their total deposits was insured.

[4] Statistics of banks in Canada are published monthly in the *Bank of Canada Statistical Summary*.

return) rose. For instance, the yields on three-month Treasury bills offered weekly by the government increased from approximately 3.5% at the beginning of 1959 to 6.16% in mid-August—the highest level in 30 years. Also, in the same period, the Bank of Canada's discount rate (the interest charged on its loans to the chartered banks), which is automatically set at 0.25% above the bill rate, rose from 3.75 to 6.41%.

Since the maximum interest rate which the chartered banks may charge on loans to customers is legally established at 6%, there was very little borrowing from the Bank of Canada as the discount rate approached and exceeded this legal maximum lending rate. The chartered banks early in March 1959 raised their prime lending rates from 5¼ to 5½%, and therefore in the subsequent expansion of loans there remained only a moderate inducement in the form of higher interest rates.

At the beginning of 1959 the chartered banks' ratio of cash reserves (deposits with the Bank of Canada, and Bank of Canada notes) to deposit liabilities averaged 8.3%, the required minimum being 8%; and their ratio of liquid assets (cash reserves, day-to-day loans, and Treasury bills) to deposit liabilities averaged 16.7%, the agreed minimum being 15%.

As the banks increased their loans about $853 million in the first three quarters, they reduced their investments (mostly government securities) about $751 million in order to avoid any appreciable increase in their deposit liabilities. The slight increase in such liabilities which did occur, and the banks' inability to increase their cash reserves because of the central bank's restrictive policy in open-market purchases and discount rates kept the banks' average cash reserve ratio near the 8% minimum. Also, the banks' liquid asset ratio declined to 15.6% in April 1959 (the lowest level since the 15% minimum became effective in mid-1956), increased for a few months, and then declined again to 15.8% in August. No appreciable change in commercial bank credit and interest rates was expected in the fourth quarter of 1959.

United Kingdom.—A moderate increase in demand for bank loans in the United Kingdom in 1959, reflecting a continuation of economic expansion, was met without appreciable change in credit policy. In 1958 the government-owned Bank of England, the central bank which controls in various ways the privately owned commercial banks, reduced its discount rate from 7 to 4% and continued the latter rate in 1959.[5] Frequently, the Bank of England made small, temporary discounts and advances to assist the discount houses (about 12 in London) which act as intermediaries between the bank and the commercial banks, but the total amount of such borrowings declined slightly during the first three quarters of 1959. In the same period, the Bank of England altered only slightly its holdings of government securities (an increase of about £82 million) in order to assist the commercial banks in meeting their reserve requirements.

The London clearing banks, consisting of five large commercial banks with numerous branches which account for about three fourths of the banking resources in the United Kingdom, and six smaller commercial banks having more than a thousand branches, increased their extension of credit only by about £36 million at the end of the first three quarters of 1959. During this period their discount rates and interest returns on three-month Treasury bills rose from 3.16 to 3.5%, and their rates on fine trade bills remained approximately at 4¼ to 5¼%. The clearing banks increased their loans about £380 million and decreased their investments about £344 million. Approximately half of the increase in loans was for financing consumer purchases—that is, loans to the personal and professional group, to hire purchase (installment credit) finance houses, and to the retail trade.

This development reflected largely the improvement in 1958 of banking facilities for extending consumer installment credit and personal loans, and the end of special restrictions on such loans. The other half of the increase in the banks' loans was accounted for by agricultural and business borrowers. The decrease in the banks' investments, mostly by selling bonds and gilt-edged stocks rather than bills, enabled them to expand loans without any great increase in deposit liabilities and to meet reserve requirements without appreciable difficulty.

Aggregate net deposit liabilities (deposits minus balances and cheques in collection) of the clearing banks did not increase until the third quarter of 1959, and at the end of this quarter were only about £38 million greater than at the beginning of the year. The banks' cash ratio (cash or till money and deposits at the Bank of England to deposit liabilities) was generally maintained at or fractionally above the traditional and agreed ratio of 8%. Also, their liquidity ratio (cash, call loans, Treasury bills, and commercial bills to deposit liabilities) declined only slightly, from 34.6 to 33.2%, and was maintained during the first three quarters, except for March and May, at a comfortable margin above the agreed minimum of 30%.

[5] Statistics of banks in the United Kingdom are published in the *Weekly Bank Return* of the Bank of England, in the *Monthly Statement of Balances of London Clearing Banks*, and in the *Quarterly Analysis of Advances* by the British Bankers' Association.

BAPTIST CHURCHES. The 27 autonomous Baptist congregations in the United States reported for 1958 (in the *Yearbook of American Churches*, 1960 ed.) a total membership of 20,493,381 and an aggregate of 90,487 churches. Baptists continue to comprise the largest single communion and represent nearly one third of all Protestants in the country.

Of the 27 Baptist bodies, the Southern Baptist Convention (see below) is the largest. The National Baptist Convention, U.S.A., Inc., a Negro group, ranks second, with an estimated 5 million members reported for 1958. Ranking third is the National Baptist Convention of America, an "unincorporated" Negro denomination, with 2,668,799 members in 1956; and fourth, the American Baptist Convention (see below). Membership figures for other large Baptist bodies are given in the article CHURCH MEMBERSHIP, U.S.

SOUTHERN BAPTIST CONVENTION

This largest of Baptist bodies, organized in Augusta, Ga., in 1845, reported 31,498 churches in 1958 with a membership of 9,206,758 and 1,111 associations in 27 states.

The 71 Southern Baptist educational institutions reported 67,509 students in 1958–59, with 6,561 in the six seminaries located at Louisville, Ky., New Orleans, La., Fort Worth, Texas, Mill Valley, Calif., Wake Forest, N.C., and Kansas City, Mo. There were 74 students in the American Baptist Theological Seminary for Negroes located at Nashville, Tenn. The educational institutions reported endowments of $74,103,029 and property valued at $207,395,946. The 39 Baptist hospitals reported property valued at $147,721,740, and 413,187 patients during 1958. The 30 children's homes reported 5,055 children, and property valued at $30,080,447. The denomination supports 1,341 foreign missionaries and 1,386 home missionaries. Gifts amounted to $45.58 per capita in 1958, with $8.12 per capita going to missions and benevolences. The Relief and Annuity Board reported 18,678 active members, with assets totaling $63.5 million.

The publishing division of the convention is the Baptist Sunday School Board, located in Nashville, Tenn. In 1958 it distributed 77,364,840 copies of periodicals and published 4,263,910 books. Dr. Ramsey Pollard, pastor of Broadway Baptist Church, Knoxville, Tenn., was elected president of the 1959 convention held in Louisville, Ky. The office of the Southern Baptist Convention Executive Committee is located at 127 Ninth Avenue, North, Nashville 3, Tenn.

PORTER W. ROUTH,
Executive Secretary, Executive Committee,
Southern Baptist Convention.

AMERICAN BAPTIST CONVENTION

The American Baptist Convention, formerly known as the Northern Baptist Convention, received its name in 1950, thus securing a uniformity of nomenclature with national societies such as the American Baptist Foreign Mission Society and the American Baptist Home Mission Society, which participated in the organization of the convention and cooperate in its work.

In 1959 the convention, representing the cooperative interest of 6,245 churches in 34 Northern

WIDE WORLD

Ethel Barrymore, with her brothers, the late Lionel (left) and John, at a reunion in 1932 of the first family of the American theater. Miss Barrymore died in Hollywood, June 18.

and Western states, had a total membership of 1,563,593. Its program of missionary and benevolent work is carried on in the United States, Africa, Asia, Europe, and several Latin American countries by 7 national societies and boards, 34 state conventions, and 15 city societies. It is supported by contributions from churches to a unified budget, representing the interests of all agencies. The approved budget for 1960 is $10.5 million. This amount, plus about $2 million of nondonation income, provides approximately $12.5 million per year for the support of the missionary enterprises of the American Baptist Convention. The raising of the budget is primarily the responsibility of the Council on Missionary Cooperation. The convention is affiliated with the Baptist World Alliance, the National Council of Churches of Christ in U.S.A., and the World Council of Churches.

In 1959, at Des Moines, Iowa, Dr. Herbert J. Gezork of Newton Centre, Mass., was elected president of the convention for 1959–60. Dr. Edwin H. Tuller was elected general secretary for the term 1959–62.

BARRYMORE, Ethel (79), American actress: b. Philadelphia, Pa., Aug. 15, 1879; d. Beverly Hills, Calif., June 18, 1959. Regarded in her later years as the *grande dame* of the American stage, Ethel Barrymore had an acting career that spanned more than half a century. She was the last member of the ruling triumvirate of Broadway's "royal family," which, besides herself, included her brothers Lionel (1878–1954) and John (1882–1942).[1] In 1928 a New York theater was named in her honor —an encomium now enjoyed by only two other actresses, Helen Hayes and Lynn Fontanne.

Ethel Barrymore was educated at the Convent of Notre Dame in Philadelphia, where her grandmother, Louisa Lane Drew, was manager of the Arch Street Theatre. At the age of 14 she joined the venerable Mrs. Drew, famous for her portrayal of Mrs. Malaprop, in a production of *The Rivals* in Montreal. Miss Barrymore's first New York appearance was on Jan. 25, 1894, also in *The Rivals*. For the next several years she played a number of minor roles, working with such theater greats as Sir Henry Irving, W. H. Gillette, and Elsie de Wolfe. She became a star on Feb. 4, 1901, when she was featured as Madame Trentoni in Charles Frohman's production of *Captain Jinks of the Horse Marines*.

Now a recognized leading lady (as well as a great beauty), Miss Barrymore was seen either in New York or London during almost every theater season for the next four decades. Her appearances included roles in *Trelawny of the Wells* (1911), *The Twelve Pound Look* (1911), *Our Mrs. McChesney* (1915), *The Lady of the Camelias* (1917), *Déclassée* (1919), *Rose Bernd* (1922), *Romeo and Juliet* (1922), *The School for Scandal* (1923), *The Second Mrs. Tanqueray* (1924), *Hamlet* (1925), *The Merchant of Venice* (1925), *The Constant Wife* (1926), *The Kingdom of God* (with which she opened the Ethel Barrymore Theatre, 1928), *Scarlet Sister Mary* (1930), *L'Aiglon* (1934), and *Whiteoaks* (1938). Her most famous role was undertaken toward the end of her stage career, when in 1940 she opened in New York as Miss Moffat in Emlyn Williams' tender play, *The Corn Is Green*. She continued on Broadway and on the road for three years as Mr. Williams' wise and gentle Welsh schoolmarm, giving what one critic described as her "most heartwarming performance."

Miss Barrymore was also frequently seen in motion pictures, beginning in 1914. One of the highlights of her film career was her appearance in 1932 with her two brothers, John and Lionel, in *Rasputin and the Empress*. In 1944 she received the Academy Award as the year's best supporting actress for her performance in *None But the Lonely Heart*. Her final acting engagement, in television, was in 1956.

Miss Barrymore was married to Russell Griswold Colt, son of financier Samuel Pomeroy Colt, in 1909 (divorced in 1923). Her autobiography, *Memories*, was published in 1955.

BASUTOLAND. A mountainous enclave situated within the Union of South Africa, this British-protected territory is one of three High Commission Territories (the others being Bechuanaland Protectorate and Swaziland, qq.v.). Area, 11,716 square miles; population (1956 census), 641,674, including 638,857 native Africans (largely Basuto) and 1,926 Europeans.

Under a high commissioner (Sir John Maud, who assumed office in January 1959), Basutoland is administered by a resident commissioner (A. G. T. Chaplin, appointed in 1956) from his seat at Maseru (pop., 5,739). Executive and judicial authority is exercised by a paramount chief (since 1941, Bereng, a minor whose regent is Ma'Ntsebo, senior widow of Chief Seeiso Griffith). According to a new constitution agreed to by representatives of Basutoland and Britain on Aug. 22, 1959, an 80-member Legislative Assembly (including 76 Africans) is to be elected by district councils in early 1960, and an Executive Council will be established to advise the high commissioner and the paramount chief.

Revenues for 1958–59 were estimated at £1,529,921; expenditures, £1,934,835. Of the territory's 1,024 schools and institutions, 1,008 are mission schools, most of which receive government assistance. Primary school enrollment in 1957 was

[1] *The Royal Family* (1927), a play by Edna Ferber and George S. Kaufman, was reputedly based on the Barrymore family. The Barrymores were the children of successful actors—Maurice Barrymore (1847–1905), whose real name was Herbert Blythe, and Georgianna Emma Drew Barrymore (1856–93), a sister of John Drew (1853–1927), one of the leading actors of his day.

114,276. There are 17 secondary schools (with 1,326 students), 24 technical and vocational schools, and 7 teacher-training centers.

Basutoland's economy is largely agricultural; principal subsistence crops are wheat, corn, and sorghums. Exports in 1957 totaled £2,038,316; imports, £3,012,954. Chief exports and 1957 values are: wool, £1,204,050; mohair, £348,149; wheat and wheat meal, £107,570; and beans and peas, £119,586. The road system aggregates about 900 miles, including 560 miles of main roads. Maseru is connected by rail with Marseilles, Orange Free State.

BAUXITE. According to data supplied by the U.S. Bureau of Mines, in 1958 the United States produced 1,311,000 long tons (on a dried-equivalent basis) of bauxite—a 7% decrease from the 1,416,000 tons produced in 1957. Domestic consumption of bauxite in 1958 was 7,033,898 long tons, a decrease of 8% as compared with 1957. In the first half of 1959, production was 778,587 long tons. Imports in 1958 reached a new high of 7,919,000 long tons, compared with 7,098,000 tons in 1957. According to the U.S. Census Bureau, imports from Jamaica were 4,933,000 tons; from Surinam, 2,425,000 tons; from Haiti, 336,000 tons; and from British Guiana, 225,000 tons, a decline from the 391,000 tons imported in 1957. United States exports of bauxite concentrates in 1958 totaled 11,868 tons, a sharp drop from the 60,993 tons exported in 1957. Shipments to Canada were 80% of the total exports. World production in 1958 increased only 3%, or a total of 20,700,000 tons. Jamaica (the leading producer) supplied 28% of the world total, increasing its output 23% in 1958. It was followed by Surinam, USSR (on the basis of estimated production), West Germany, British Guiana, Hungary, and the United States. (See MINERAL PRODUCTION for the output of major producing countries.)

BECHUANALAND PROTECTORATE. Bounded on the north and northeast by British East Africa, on the south and southeast by the Union of South Africa, and on the west by South West Africa, this British protectorate is the largest of three High Commission Territories administered through the United Kingdom Commonwealth Relations Office, the others being Basutoland and Swaziland (qq.v.). Area, 275,000 square miles; population (mid-1958 est.), 334,000, which is predominantly African.

Under a high commissioner, Bechuanaland is administered from Mafeking, Cape Province, Union of South Africa, by a resident commissioner (Robert Peter Fawcus) who presides over joint meetings of African and European advisory councils. African chiefs exercise local rule through eight tribal administrations, the largest being the Bamangwato (1946 census pop., 100,987), whose capital is Serowe (15,935).

Revenue in 1957–58 was £1,886,972, including a United Kingdom grant-in-aid of £480,000, and expenditure totaled £2,086,192. In 1958 there were 169 African primary schools with 29,924 pupils, and 6 African secondary schools, 9 European schools, and 5 schools for mixed races.

The pastoral economy is dependent on cattle-raising and dairying. In 1958, exports were valued at £2,599,088; imports, £3,503,647. Chief exports and 1958 values are: cattle carcasses, £1,473,699; hides, £162,535; live cattle, £167,079; sorghum, £66,200; and sheep and goats, £8,229. Main imports are wheat, textiles, and vehicles.

The government-owned Southern Rhodesia Railways operates some 394 miles of single track. Main roads aggregate 550 miles. Airfields are located at Francistown, Serowe, and ten other towns. The government operates an extensive radio network.

On June 2, 1959, leaders of the Bamangwato tribe signed an agreement permitting a Rhodesian company to explore for minerals in 40,000 square miles of tribal territory.

BELGIAN CONGO. A Belgian colony in equatorial Africa. Area, 905,378 square miles; pop. (est. July 1, 1958), 13,559,000, including about 110,000 whites, mainly Belgians. Chief cities and populations (Jan. 1, 1957): Léopoldville, the capital, 366,819; Elisabethville, 169,985; Jadotville, 76,877; and Stanleyville, 71,284.

The People.—The natives are mainly Bantu and Sudanese tribesmen, with some Nilotics, Pygmies, and Hamites. There are 4 main language divisions, each including numerous dialects. About 2.6 million natives live outside tribal areas and are subject to certain restrictions on movement. Native wage workers number about 1.2 million. The tribal population is engaged predominantly in subsistence agriculture. Government-sponsored *paysonnats* or farm settlements have some 150,000 native families.

Government.—Legislation is by decree of the Belgian monarch, countersigned by the minister for the colonies. The governor general of the Belgian Congo is appointed in Brussels and is responsible to the minister for the colonies, but has unrestricted powers in the Congo. He is aided by 6 governors who head the administration of the provinces. Appointive advisory councils exist on the national and provincial levels, but exercise only advisory functions. Elections for borough councils in Léopoldville, Elisabethville, and Jadotville on Dec. 8, 1957, marked the first step toward popular government. On Jan. 13, 1959, the Belgian government outlined a program for the gradual attainment of self-rule in the Congo. (See below *Principal Events, 1959.*)

Education and Religion.—Over 40% of the native school-age population attends school (one of the highest proportions in Africa), but relatively few natives go beyond the primary level. In 1957 there were 111 state schools for Africans, with 36,650 pupils; 869,977 attended schools subsidized and regulated by the state; 376,019 attended nonsubsidized schools maintained by missions and private companies; and 13,214 attended vocational and technical schools. The colony has 2 universities: the University of Lovanium (365 students in 1959, including 247 Africans); and the Belgian Congo and Ruanda-Urundi State University (141 students in 1957, including 17 Africans). The first nuclear reactor in Africa was opened at the University of Lovanium on June 7, 1959. Roman Catholics number about 4 million; Protestants, 750,000; and Moslems, 90,000.

Finance.—The estimated ordinary budget for 1958 was: revenue, 12,471 million francs; expenditure, 12,438 million. Extraordinary expenditure is mainly under the 10-year development plans. The first 10-year plan (1950–59) involved outlays of over $1 billion in transportation, agriculture, education, housing, hydroelectric power, and other fields. The second 10-year plan (1960–69) will invest an estimated $1.1 billion, with stress on agriculture and road-building. The Belgian Congo franc equals U.S.$0.02.

Transportation and Communications.—The Congo River and its tributaries, providing over 8,000 miles of navigable waterways, form the backbone of the colony's transportation system. Roads total 87,360 miles (1957), including 20,878 miles of main roads; paved roads, however, exist only in and around the chief cities and aggregate a few hundred miles. Public railways total 3,170 miles (1957). The colony has 9 international airports and many secondary and local fields. Passenger cars numbered 37,841 in 1958; telephones (including Ruanda-Urundi), 22,370.

Production.—The Belgian Congo is an important producer of minerals and cash crops, but about three-fourths of the native population remains engaged in primitive tillage. Chief native food staples are manioc, maize (corn), sweet potatoes, rice, sorghum, peanuts, and bananas. Many natives are employed on the European-owned rubber, coffee, and palm-tree plantations. Cotton, a major cash crop, is grown by Africans but processed and sold by Europeans (1958–59 output, including Ruanda-Urundi, 225,000 bales of 500

pounds each). Forest products include hardwoods, cinchona bark, ivory, derris, and skins. The processing of agricultural products and minerals constitutes the colony's chief manufacturing activities, although there has been considerable recent development of local-consumer-goods industries, including foodstuffs, building materials, chemicals, soap, textiles, leather, footwear, and glassware. Installed electric capacity in 1957 totaled 695,900 kw. (89% hydroelectric), a rise of 43% over 1956. Aided by high prices for its exports, the colony expanded its gross national product to an estimated 61,150 million francs in 1956, up 81.5% over 1950.

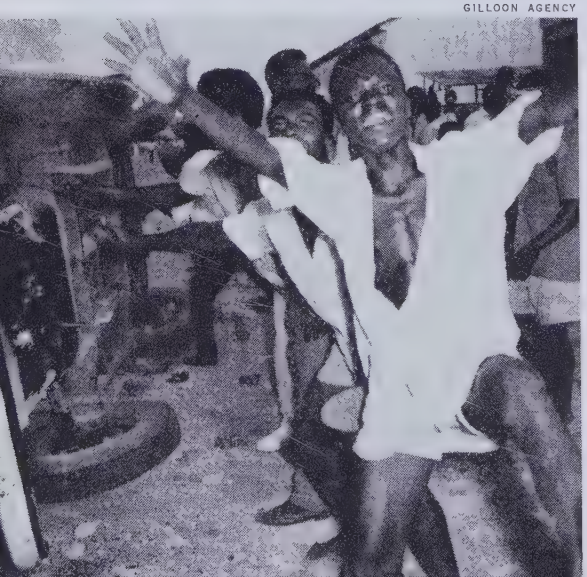
The Belgian Congo is the world's largest supplier of industrial diamonds and cobalt, and an important producer of copper and other minerals. Output of industrial diamonds in 1957 totaled 15,015,807 carats; cobalt ore (Co content), 8,115 metric tons; and copper ore (Cu content), 242,200 metric tons. Other mineral products include manganese ore, zinc ore, tin concentrates, tungsten ore, and coal. Production of uranium oxide (which is shipped mainly to the United States and Great Britain) approximated 1,000 tons in 1958, and the colony's reserves of this strategic mineral were estimated at 10 million tons.

Foreign Trade.—Exports from the Belgian Congo and Ruanda-Urundi in 1958 (exclusive of fissionable materials) totaled 20,207 million francs, down about 15% from 1957 because of the drop in world prices for the colony's products; imports, 17,985 million, down about 18%. Chief exports, quantities (in tons), and values (in millions of francs) in 1958 were: copper, 241,341 tons (5,401 million francs); coffee, 70,603 (2,815); palm oil, 164,586 (1,676); industrial diamonds, 14,383,000 carats (1,474); cobalt, 7,182 (1,176); and cotton, 34,410 (1,066). Imports are mainly iron and steel products, machinery, textiles, and foodstuffs. Belgium took 21.5% of 1958 exports by value, and provided 35.2% of imports. The United States took 22.1% of exports and supplied 14.3% of imports.

Principal Events, 1959.—For many years the Belgian Congo had been noted as the showpiece of European paternalism in Africa. While yielding high profits to the Belgian colonialists, the colony enjoyed a higher living standard than most African areas, exercised virtually no political rights, and seemed to have been bypassed by the nationalist movements sweeping the rest of the continent. In 1959, however, African nationalism erupted in the Congo in a manner anticipated by few observers.

Frenzied natives overturn car during rioting in Leopoldville, Belgian Congo, in January. Scores were killed in the violence, which had its roots in nationalistic fervor.

GILLOON AGENCY



On January 4, following the banning of a meeting in Léopoldville of the Abako (Association of the Lower Congo), native crowds demanding independence rioted for more than two days, with police action resulting in the deaths of 47 Africans (unofficial reports put the toll considerably higher). In succeeding weeks, riotous demonstrations took place at Matadi, again at Léopoldville, and in other towns. On October 30–31, following the dispersion by troops of a banned meeting of the Congo National Movement, fighting in the Stanleyville area resulted in over 70 natives killed. In mid-October and early December, scores of natives were killed in warfare between Baluba and Lulua tribesmen in the Luluabourg area.

The Belgian government, which had avoided a decision on its colonial policy as long as its colony seemed immune from African nationalism, on January 13 announced a program for the gradual attainment of self-rule in the Belgian Congo. The program, as shaped during succeeding months and outlined by Minister for the Congo Auguste de Schryver on October 16, called for the election by universal male suffrage of rural and municipal councils in late December. These councils in early 1960 would choose members of provincial councils. Later in 1960, two chambers would be constituted on the national level and a ministry would be appointed by the Belgian king. After four years, the Belgian Congo and Belgium would jointly decide on their future relationship.

Joseph Kasavubu, leader of the Abako, and other spokesmen for the main nationalist groups rejected the Belgian program, and Kasavubu urged a boycott of the forthcoming local elections. The boycott proved strikingly effective. In the elections on December 20, only about 31% of the eligible Congolese voters went to the polls in Léopoldville. Elsewhere the Congolese Nationalist Movement, led by Patrice Lumumba, showed considerable strength, obtaining about 80% of the vote in Stanleyville. Meanwhile, King Baudouin I, who arrived in the Belgian Congo on December 17 on a two-week tour, was greeted everywhere with demands for independence. At a meeting of five nationalist parties in Kisantu on December 24–27, resolutions were adopted calling for immediate independence. As a result of these developments, the Brussels government altered its program and moved to grant the Belgian Congo independence in the year 1960.

M. J. G.

BELGIUM. A constitutional monarchy on the northwestern coast of Europe. Area, 11,779 square miles; pop. (est. July 1, 1958), 9,053,000. Chief cities and populations (est. Dec. 31, 1957): Brussels, the capital, 993,766, with suburbs (without suburbs, 1956: 172,009); Antwerp, 256,126; Ghent, 161,382; and Liége, 156,612. French is spoken by the Walloons in the south and east; Flemish, by the Flemings in the north and west.

Government.—King Baudouin I (b. 1930; acceded 1951) is the hereditary constitutional monarch. The bicameral Belgian Parliament is elected for a 4-year term. The Chamber of Deputies (212 members) is elected directly by compulsory vote. Of the Senate's 175 members, 106 are directly elected by popular vote, 46 are elected by provincial councils, and these senators then choose the remaining 23. Following the elections of June 1, 1958, party alignment in the Chamber of Deputies was: Social Christian, 104; Socialist, 84; Liberal, 21; Communist, 2; independent (Catholic), 1. Premier Gaston Eyskens (Social Christian) heads a Social Christian-Liberal coalition government which was appointed on Nov. 6, 1958.

Education and Religion.—More than half of all school children attend Roman Catholic schools, which are partly subsidized by the government. Illiteracy is almost nonexistent (3% of persons over 15 years in 1947). In the 1956–57 school year, primary schools numbered 9,047 (945,486 pupils); and infant schools, 4,539 (352,741). On the secondary level there are several hundred free higher-grade schools, state and communal middle schools, and royal athenaeums and *lycées*. There are also numerous teacher-training schools, and agricultural, technical, commercial, and professional schools. Belgium's principal universities are at Brussels (4,056 students in 1957–58), Ghent (3,635), Liége (4,200), and Louvain (11,014). The majority of the population is Roman Catholic; there are small Protestant and Jewish minorities.

Finance.—The revised ordinary budget for 1958 set expenditure at 105.1 billion francs, and revenue at 95.5 billion, for an anticipated deficit of 9.6 billion (compared with an anticipated surplus of 5.1 billion in the original 1958 budget). Extraordinary expenditure (revised) was estimated at 20 billion francs; revenue, 0.8 billion. Belgium's public debt in November 1958 totaled 344.3 billion francs (323.6 billion in December 1957). The Belgian franc equals U.S.$0.02.

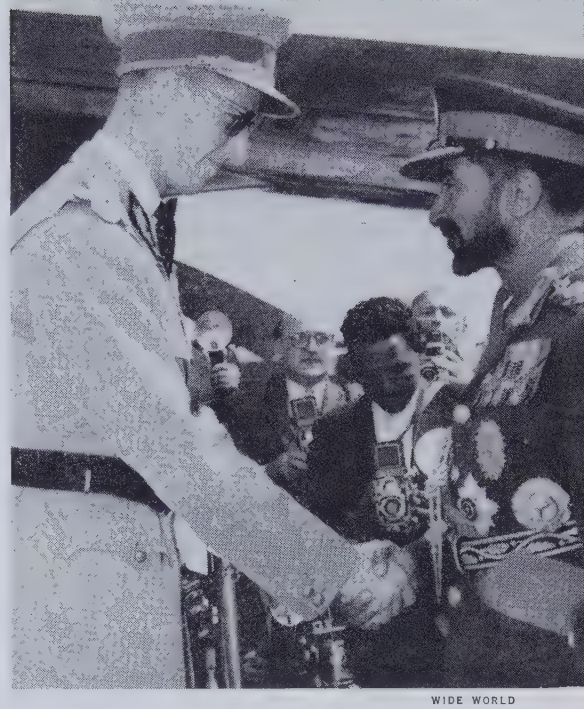
Transportation and Communications.—Belgium's railroad network, the densest in Europe, includes 3,004 miles (17.5% electrified) operated by the Belgian National Railway Company (1957), and over 3,000 miles of narrow-gauge track operated by the National Interurban Railway Company. The road network included 14,190 miles of principal roads in 1957. Inland waterways (1,130 miles in 1957) serve most of the industrial areas. Belgium's merchant fleet at the beginning of 1958 comprised 91 vessels aggregating 531,187 gross registered tons. Sabena Belgian World Airlines, a semiprivate company controlled by the government, has a monopoly of scheduled air transport. Automobiles in 1957 numbered 615,630; telephones, 986,953; radio receiver licenses, 2,307,184; and television receivers, 250,000 (July 1957).

Production.—The Belgian economy is characterized by a high degree of industrialization and dependence on foreign markets and raw materials. Of the labor force of 3,448,500 in 1956, 1,239,400 were engaged in industry and 353,100 in agriculture, forestry, and fishing. In 1958, a year of recession and slow recovery, overall industrial output was about 6.5% below 1957. Production of crude steel approximated 6 million metric tons (down about 4% from 1957); pig iron and ferroalloys, 5.5 million (down 1%); and coal, 27.1 million (7% below 1957 and the lowest in 10 years). Electricity output averaged 1,043 million kw.-hr. monthly, about equal to the 1957 level. Other important Belgian industries are textiles, chemicals, construction materials, paper, leather, ceramics, foodstuffs, tobacco products, footwear, and diamond-cutting (an important dollar earner). National income in 1958 was estimated at 404 billion francs, down 2.0% from 1957.

Belgian agriculture is featured by small, high-yield farms. Livestock raising is important, and Belgium is self-sufficient in butter, milk, and eggs, and almost self-sufficient in meat. Output of most major crops in 1958 continued at the bumper levels of the previous year; yields of principal crops in 1958, in thousands of bushels, were: wheat, 28,600; rye, 7,870; barley, 14,600; oats, 30,515; and flaxseed, 562. Production of potatoes in 1958 totaled 1,914,000 metric tons; sugar beets (1958–59), 3,122,000 short tons.

Foreign Trade.—Exports of the Belgium-Luxembourg Economic Union totaled 152,267 million francs (down 4.4% from 1957); imports, 156,447 million (down 8.8%). Belgium's chief exports are steel and metal products, textiles and clothing, nonferrous metals, chemicals, and diamonds; imports: machinery and electrical equipment, textile fibers, base metals, metallic ores, fuels, and foodstuffs. Netherlands took 21% of Belgium-Luxembourg exports in 1958; West Germany, 12%; and France, 11%. West Germany provided 17% of 1958 imports; Netherlands, 16%; and France, 12%.

Principal Events, 1959.—On February 10 it was announced in Brussels that eight coal mines in the Borinage region of southern Belgium would be shut down. For several years the Borinage mines had operated on the basis of subsidies because of their high costs of output. Their closing, however, meant the loss of some 6,000 miners' jobs, and the miners of the affected area went on strike. On February 18 the Socialist Trade Union Federation called out all the nation's miners in protest against the government's plan. At the height of the strike, some 100,000 miners were out, and some minor acts of violence, mainly disruption of local communications, took place. The strike was settled on February 24, when the unions accepted a mine-owners' guarantee of the government plan for resettling miners of mines to be closed later in the year.



WIDE WORLD

King Baudouin I (left) of Belgium welcomes Ethiopian Emperor Haile Selassie on his arrival July 17 for state visit.

Under a plan agreed upon in August by the Belgian government and the High Authority of the European Coal and Steel Community, the closing of noncompetitive Belgian mines was to proceed over a period of about four years until Belgian coal output had been reduced by some 5.5 million tons to an annual level of 23.4 million. Costs required for the readaptation of an estimated 17,500 miners were to be shared by the Belgian government and the High Authority, with the High Authority setting aside $4 million to the end of 1959 and $7.5 million to June 30, 1962.

For the economy as a whole, 1959 was a year of recovery from recession, although the pace of recovery was slow. The percentage of unemployed, which had averaged 8.6% of the labor force in 1958 (5.5% in 1957), declined only slightly to 7.8% by June 1959. The government sought to speed recovery by public works outlays, rationalization of the coal industry, and encouragement of investment through tax relief, cheapening of credit, and, in some cases, direct grants for investment in fixed assets. Particular efforts were made to channel investment into distressed areas and to attract foreign capital.

The long-standing controversy over government support for church schools was allayed in 1959, following the adoption of an agreement by the three major parties on Nov. 6, 1958. Legislation passed by the Belgian Parliament in May 1959

provided that when a sufficient number of parents in a district submitted requests, either a state school would be opened or a private school be given subsidies; that church schools would be given the same subsidies as schools operated by provincial or local authorities; and that parents would be free to choose which type of school their children would attend. Other provisions raised the school-leaving age above the prevailing 14 years, abolished fees for secondary education, and authorized the setting up of a special fund to make up for the shortage of state schools.

King Baudouin I, accompanied by Foreign Minister Pierre Wigny, arrived in Washington on May 11, on a three-week tour of the United States. Following criticism from certain circles in Belgium that former King Leopold was exercising undue influence in public affairs through his son, the king, Leopold agreed to leave his residence with Baudouin at Laeken and remove to the Chateau d'Argenteuil, on the outskirts of Brussels. Maurice van Hemelrijck, minister for the Belgian Congo who favored speedy implementation of the government's plan of January 13 for the democratization of the Belgian Congo, resigned on September 3, when a majority of the cabinet indicated they favored gradualness. He was succeeded by August de Schryver. (See also BELGIAN CONGO.)

M. J. G.

BENELUX ECONOMIC UNION. A projected union of the economies of Belgium, the Netherlands, and Luxembourg, initiated in 1948 as a customs union for goods from non-Benelux nations. Further steps toward union have included the gradual removal of restrictions on some 98% of goods traded among members, reduction of tax differences, elimination of restrictions on the movement of capital and labor, and the signing of Benelux trade treaties with other nations. In 1958 the three nations signed a 50-year Benelux Economic Union Treaty, codifying results thus far achieved and paving the way toward full economic integration (the treaty had not yet been ratified by 1959). The union's chief institutions are a nine-member Committee of Ministers, an Inter-Parliamentary Advisory Council of 49 members, and a secretariat general with headquarters at Brussels.

Italian Renaissance art expert Bernard Berenson, shown here at his villa near Florence, Italy, died on October 6.

DAVID LEES —LIFE © 1959 TIME, INC.

BENSON, Ezra Taft, U.S. secretary of agriculture: b. Whitney, Idaho, Aug. 4, 1899. A graduate of Brigham Young University in 1926, Benson operated a farm in Whitney until 1929, served as an economist at the University of Idaho until 1938, and then functioned as secretary of the National Council of Farmer Cooperatives from 1939 to 1944. He took office as secretary of agriculture in President Eisenhower's cabinet in January 1953.

The problem of farm surpluses—particularly of wheat—continued to haunt the secretary in 1959, complicated by growing political pressures upon him as the 1960 elections loomed closer. Persistent efforts to adjust price supports downward met congressional and farm-state resistance, even within his own party. Benson has often been used as the "whipping boy" or political target for opponents of administration farm policy.

For the secretary the year 1959 was marred by a wrangle over interest rates for government rural power loans through the Rural Electrification Administration (q.v.), a unit of the Department of Agriculture. Benson's proposal in February to increase the rates led to congressional protest in the form of a bill to give the REA director, rather than the secretary, authority over loan applications. The president vetoed the bill on April 27. The Senate overrode the veto, but the House of Representatives upheld it by just four votes on April 30.

Benson stood firm throughout 1959 on his farm policies and proposals. On November 10 he announced that the administration planned to submit a "sound" program to Congress calling for a voluntary plan to retire land from crop production in surplus areas; a "vigorous" food-for-peace plan to use surpluses to feed the world's hungry and help the development of backward areas; and "a realistic price support program." On December 14, recovering from a successful gall bladder operation, Benson said: "Our policy is right. If anything is right, it ought to be done—and it will prove to be good politics."

Benson, who heads the administration's Food for Peace Program, led a May meeting in Washington, D.C., with representatives of four other wheat-exporting nations, to discuss plans to implement the program.

In late September 1959 the secretary undertook a 16-day tour of northern and eastern Europe to promote good will and trade relations. A Mormon apostle (minister), he preached a sermon in Moscow's Central Baptist Church on October 1 to a Russian audience estimated at 1,500.

BERENSON, Bernard (94), American expert on Italian Renaissance art: b. Vilna, Lithuania, June 26, 1865; d. Settignano, near Florence, Italy, Oct. 6, 1959.

Born of a rabbinical family which moved to Boston when Berenson was 10, he was sent to the Boston Latin School and then to Harvard College with the help of the wealthy art patroness, Mrs. Jack (Isabella Stewart) Gardner, whose art collection he helped her to assemble some years later. He settled in Italy in 1888. During the next 12 years he published four books on Italian paintings of the Renaissance (later issued as *Italian Painters of the Renaissance,* rev. ed. 1930), which established him as an authority without peer on paintings of the period. By 1900 he had also amassed

enough of a fortune by advising collectors and dealers—as he later advised the art dealer, Lord Joseph Duveen—to buy an 18th century villa, I Tatti, in the hills of Settignano overlooking Florence. He remained there for the rest of his life, collecting art objects and a library of more than 55,000 books on art, as well as writing art criticism and history.

The method he followed of establishing the authorship and authenticity of paintings was to discover what characteristic each artist had that was not shared by any other. Although he arrived at conclusions by this method that were later successfully challenged, sometimes by himself, he corrected so many erroneous attributions of paintings that for a half a century the opinion of "B.B." was sought on almost every major transaction and collection involving works of the Italian Renaissance. Later in his life he spoke of regretting the time he had squandered on giving critical advice that he could have used in broadening his experience and learning.

During World War II, Berenson, a convert to Roman Catholicism, took refuge at times with friends to escape persecution by the Fascists for his Jewish origin. His wife, the sister of the American essayist Logan Pearsall Smith, died in 1945. After World War II he continued to entertain artists, scholars, and connoisseurs at I Tatti, regaling them with his opinions on art, which could be scathingly critical whenever modern nonrepresentational painting was discussed. He published an autobiographical triology in his last years: *Aesthetics and History* (1948), *Sketch for a Self-Portrait* (1949), *Rumor and Reflection* (1952). *The Passionate Sightseer* was scheduled for release in 1960. He left his library, art collection, and villa to Harvard.

BERLIN. See GERMANY.

BERMUDA. First settled in 1609, this group of 300 islands in the Atlantic Ocean (20 inhabited) lies some 580 miles east-southeast of Cape Hatteras, North Carolina; it forms a British crown colony with a land area of 20.59 square miles. The population (37,403 in 1950) had increased by 1958 to 43,480 (est., including 27,443 colored), making this the seventh most densely populated land unit in the world. On Main Island is located Hamilton, the capital (founded 1790; pop. est., 3,000 in 1957); other important islands are St. George's, St. David's, Somerset, and Ireland.

Government.—On April 6, 1959, Maj. Gen. Sir Julian Alvery Gascoigne was named governor and commander in chief, to succeed Lt. Gen. Sir John Dane Woodall in October. The governor is assisted by a 7-member Executive Council, an 11-member Legislative Council, and a 36-member elected House of Assembly (the oldest British colonial parliament), to which 9 new members were returned at elections held in 1958.

Finance.—In 1958 revenue was £3,861,226; expenditure, £3,885,226, including £493,907 for trade development, £484,386 for education, and £458,498 for public works.

Education.—Education is compulsory between the ages of 7 and 13. In 1958 there were 66 schools (10,068 pupils), including 44 primary schools (aggregate enrollment, 8,307). Vocational and technical students totaled 282.

Transportation and Communications.—Direct flights are made between New York and Bermuda by British Overseas Airways Corporation, Eastern Air Lines, Eagle Airways, and Pan American World Airways. Other principal air services link the colony with Canada, the West Indies, Cuba, Colombia, Venezuela, and Europe. Twelve shipping lines supply service between Bermuda and North American and European ports. Visitors arriving by air numbered 92,479 in 1958; by ship, 38,528 (including 22,382 cruise passengers). United States citizens are not required to have passports. A large airfield forms part of a United States leased naval and air base. The National Aeronautics and Space Administration announced in August 1959 that there would be built in Bermuda a key station in the system which is being set up to track the first manned United States satellite.

Foreign Trade.—In 1958 imports, totaling £17,146,958 from 60 countries, came principally from the United States (£8,534,908). They included gasoline, 16,440,993 gallons, valued at £1,252,312; cotton clothing, £471,674; electrical supplies, £364,449; hardware, £213,909; and television receivers, 2,674, valued at £17,940. Exports totaled £7,673,191, including reexports of bunkers and ship stores, £2,295,265; and drugs and medicines, £2,395,265.

Principal Events, 1959.—On April 28–29, Prince Philip, Duke of Edinburgh, visited Bermuda and took part in ceremonies marking the 350th anniversary of the settlement of the colony. Continuing throughout the year, a series of commemorative events included historical plays, naval visits, the issuance of special coinage and postage stamps, and, on July 28, a parade recalling the date in 1609 on which the *Sea Venture*, flagship of a fleet bringing supplies to the colonists in Virginia, was wrecked in the Bermudas. Its commander, Admiral Sir George Somers, survived and founded the colony.

BERYLLIUM. World output of beryl, the only commercial ore of beryllium, declined from 11,900 short tons in 1957 to 7,000 tons in 1958. Production (mine shipments) of beryl in the United States in 1958 totaled 463 short tons, compared with 521 tons in 1957. The Belgian Congo, Brazil, Argentina, Union of South Africa, and India supplied the major part of the 4,599 tons imported by the United States in 1958. In the United States, 175 operators in 9 states produced quantities of beryl ranging from a few pounds to 114 tons. South Dakota produced about 52% of the total domestic beryl; Colorado, 2%; New Mexico, 6%; and six other states, 13%. Plants in Pennsylvania and Ohio produced beryllium metal, beryllium-copper master alloy and other beryllium-copper alloys, beryllium-aluminum, beryllium-nickel, and beryllium oxide. (See MINERAL PRODUCTION for the output of major producing countries.)

BHUTAN. Closely related by race and religion to Tibet, this autonomous Himalayan state (area, about 18,000 square miles; pop., est. mid-1958, 650,000) lies south of that country and north of India, whose government under a 1949 treaty is responsible for Bhutan's external relations. Its maximum length is 190 miles. On the northern border are Kula Kangri (24,780 feet) and other famous peaks. Thimbu is the present (1959) capital[1] and residence of the hereditary ruler, Maharaja Jigme Dorji Wangchuk (installed on Oct. 27, 1952). Among other leading towns are Bumthang, Punakha, Tongsa, and Paro. The religion of the dominant Bhotias (descendants of a Tibetan Mongolian stock) is Buddhism in the form prevalent in Tibet. Tashi Chho is the largest of many defended lamaseries.

Rice, corn, and millet are the principal subsistence crops. The northern forests provide valuable hardwoods for export. In addition, stock raising is an important industry, and iron and silver are mined for use in the manufacture of swords and muzzle-loading guns.

In 1959, Bhutan, in common with adjoining Sikkim and other Indian border states, was menaced increasingly by Communist China, which, according to an Indian government white paper,

[1] There is no fixed capital, the maharaja's current residence serving as the seat of government. Punakha has served as the winter capital, and Bumthang as the summer capital.

claims the Tashigong area together with a considerable part of northwestern Bhutan. Prime Minister Jigme P. Dorji visited New Delhi in August to discuss with Prime Minister Jawaharlal Nehru the strengthening of Bhutan's northern border. It was announced in September that, in order to make Bhutan accessible from the south, India would immediately begin construction of five roads, of which four would furnish direct links with Indian states, including a road from Jalgaon, West Bengal, to Paro and Thimbu. The sum of 150 million rupees was allocated to this project. In addition, the annual Bhutan subsidy was to be increased by 700,000 rupees for 1959–60. Under a second agreement, announced November 2, the Indian state of West Bengal will build an 18,000-kw. Jaldhaka River hydroelectric project on the Bhutan-Indian boundary. Free power will go to Bhutan, and West Bengal will pay Bhutan 8 rupees per kw. per year for power used in India.

BIOCHEMISTRY. **Coenzyme Q.**—Coenzyme Q, a new coenzyme with a quinone structure, has been isolated from the lipids of mitochondria, the small rod-like, enzyme-rich structures present in the cytoplasm of the cell. The length of the isoprenoid side chain in its formula varies with the source of the coenzyme being 6 for yeast and 10 for material isolated from the bovine and human species. Coenzyme Q is important for electron transfer, since it can accept an electron and be reduced to a semiquinone, after which it can react with inorganic phosphate to produce a semiquinone phosphate. The latter compound can then release its electron and simultaneously decompose to the original quinone and an organic phosphate, such as adenosine triphosphate.

Serum Protein Groups.—The fact that the red blood cells of all humans are not identical has long been the basis for blood grouping, necessary for identification purposes and for transfusions. The serum proteins, however, have been considered to be identical in all individuals; and the lack of (or very minimal nature of) transfusion reactions when cell-free blood has been employed has seemed to substantiate this view. That there is individuality of serum proteins as well as blood cells, however, has now been authenticated.

More than 20 years ago it was found that the peroxidase or peroxide-splitting activity of hemoglobin was markedly enhanced by serum protein; the protein responsible for this activity was called haptoglobin. Recently, intensive study has revealed that there is more than one haptoglobin and that their presence or absence is genetically controlled, resulting in haptoglobin serum groups, much as the red cells are divided into genetically controlled groups. There appear to be four serum groups, one of which is due to the complete absence of haptoglobins. While people in all parts of the world thus far examined have haptoglobin groups, the percentage of each group varies in different populations; group 0–0, those displaying an absence of haptoglobins, has thus far been found only in certain Negro populations.

Another system of inherited serum groups is called the "Gm system." There appear to be two factors in this system: Gm^a and Gm^b. Very little work has been done with these groups, and their world distribution is currently unknown. Serum groups have also been found in rabbits and probably occur in other animal species.

Fatty Acid Synthesis.—The synthesis of fatty acids has been thought to result from the condensation of two carbon units, in a manner analogous to the degradation of these substances. A three-carbon intermediate, malonic acid has now been isolated, thus requiring the formulation of a new synthetic scheme; this, furthermore, points up the fact that synthesis is not merely the reverse of degradation. According to the new theory, fatty acids are synthesized in the following way: A biotin-containing enzyme mediates the addition of carbon dioxide to acetyl coenzyme A, yielding malonyl coenzyme A. The next steps have not been proved, but undoubtedly they involve repeated condensations of malonyl coenzyme A with itself and coenzyme A, with the elimination of carbon dioxide after each condensation, until fatty acids such as palmitic are produced.

Deuterium Oxide and Sterility.—Deuterium oxide, or heavy water, is a substance identical with ordinary water except that the hydrogen atoms are replaced by an isotope of hydrogen called deuterium. When this compound is added to the drinking water of male mice in a concentration of 30 per cent, the animals gradually become sterile; fertility returns one to three months following removal of the heavy water from the diet. Since the loss of fertility coincides with the spermatogenic cycle of the mice, it has been inferred that the substitution of the heavy isotope for the ordinary hydrogen isotope interferes with the formation of normal chromosomes, possibly through a change in the type of hydrogen bonding in the chromosomal nucleoproteins. Since nucleoproteins are the substances that carry genetic traits, a change in their structure would lead to the production of lethal mutations. These experiments may help to shed new light on the structure of nucleoproteins.

Hemoglobin.—A new theory has been proposed to account for an old riddle about the mode of action of hemoglobin, a substance made up of four iron-containing heme atoms for every globin or protein molecule. The iron in hemoglobin is in the reduced state and remains unchanged during the reversible cycle of absorption and release of oxygen. When the globin is removed from the heme, the latter becomes oxidized and the oxygen can no longer be released. To explain the role of the globin, it is now postulated that in aqueous solution the heme molecules are partly exposed and partly covered by the globin. A structure of this type would result in a lowered dielectric constant around the binding sites, a condition that would retard oxidation of the iron but would not inhibit the reversible binding and release of oxygen.

The globin portion of hemoglobin is composed of two chains called alpha and beta; the synthesis of each chain is governed by a separate gene. In studying the difference between adult and fetal hemoglobin, it was found that the alpha chain is identical in each and, therefore, is produced under the control of the same gene. The entire difference, consequently, is in the constitution of the beta chain; the nature of this difference is not known.

The difference between normal and sickle cell hemoglobin (the latter occurs in the red cells of individuals with sickle cell anemia) also resides in the beta chain. This disparity lies in the substitution of a single amino acid (valine) in the sickle cell hemoglobin for glutamic acid, which occurs in the normal hemoglobin.

BIRTH STATISTICS. See Index entry.

BISMUTH. The U.S. Bureau of Mines does not publish figures on domestic output of bismuth. In 1958, domestic consumption of bismuth metal was 1,242,700 pounds, a decline of 23% from the 1,615,100 pounds consumed in 1957. The decrease was attributed to the lower level of industrial activity in the first nine months of the year and to larger imports of bismuth in the form of intermediate smelter products. Refined metal from foreign sources was 751,800 pounds in 1958, a decline of 11 per cent as compared with 849,000 pounds in 1957. Peru supplied about two thirds of this quantity; Mexico, over 24%; and Yugoslavia, the remainder. In the first nine months of 1959, United States consumption was 975,245 pounds, and general imports were 349,107 pounds of bismuth metal. (See MINERAL PRODUCTION for output by major countries.)

BLOCH, Ernest (78), Swiss-American composer: b. Geneva, Switzerland, July 24, 1880; d. Portland, Oreg., July 15, 1959. Although most renowned as the creator of specifically Hebraic music of Biblical inspiration and clangorous, rhapsodic character, Bloch began his long career as a definitely European musician abreast of musical developments after 1900 and closed it with more abstract works of neoclassical texture. Although active for a time as a teacher, he never founded a school of composition, and was too personal and idiosyncratic a composer to have real disciples. He became and remained a unique, lonely presence on the 20th century musical scene.

After early studies in Geneva with Émile Jaques-Dalcroze and in Brussels with Eugène Ysaÿe and François Rasse, Block took composition lessons from Iwan Knorr in Frankfurt am Main and from Ludwig Thuille in Munich; then lived for a time in Paris. Back in Switzerland, he lectured at the Geneva Conservatory, conducted orchestras (1909–10) in Lausanne and Neuchâtel, and from 1911 to 1915 was professor of composition and aesthetics at the conservatory. In 1916 he went to the United States (he became a citizen in 1924). From 1917 to 1919 he was on the faculty of the Mannes School of Music in New York City and simultaneously conducted his compositions with American orchestras. He served as first director of the Cleveland Institute of Music from 1920 to 1925 and directed the San Francisco Conservatory from 1925 until 1930, when he went back to Europe for some years of composing. Having returned to the United States in 1939, he taught at the University of California for several summers but later devoted his time to composing at his home in Agate Beach, Oreg.

Bloch was awarded the Elizabeth Sprague Coolidge Prize in 1919 for his Suite for Viola and Piano; in 1927 his *America* won a prize offered by the magazine *Musical America;* and in 1942 he was given a Gold Medal by the American Academy of Arts and Letters. The New York Music Critics Circle's 1947 award for chamber music went to his Second String Quartet, and the Circle gave him two of their awards for 1953, citing his Third String Quartet as the best chamber work of the season and his Concerto Grosso No. 2 as the best orchestral piece.

Bloch's works (with dates of first performance) include an opera, *Macbeth* (1910); a ritual Hebrew Sacred Service (1934); many orchestral pieces—Symphony in C Sharp Minor (1910), *Hiver—Printemps* (1917), *Trois poèmes juifs* (1917), *Schelomo,* for cello and orchestra (1917), Concerto Grosso No. 1, for strings and piano (1925), *America* (1928), *Helvetia* (1933), *Voice in the Wilderness* (1937), *Evocations* (1938), a violin concerto (1938), *Suite hébraïque,* for viola and orchestra (1953), *Sinfonia breve* (1953), Concerto Grosso No. 2, for strings (1953), and Symphony in E Flat (1956). His other works include numerous compositions for voice and orchestra—*Poèmes d'automne* (1906), *Israel* (1917); a large body of chamber music—Quintet for Piano and Strings, including use of quarter tones (1923), four string quartets (1916, 1946, 1951, 1953), Suite for Viola and Piano (1919), two violin sonatas (1920, 1924), the second entitled *Poème mystique, Baal Shem,* for violin and piano (1923), a piano sonata (1953); and many other pieces for piano solo, violin and piano, cello and piano, and small chamber ensembles.

BOBSLEDDING. See SPORTS, GAMES, AND SHOWS.

BOLIVIA. A landlocked South American republic, Bolivia borders Chile and Peru on the west, Brazil on the north and east, and Paraguay and Argentina on the south. No exact area figure has been determined, but Bolivia claimed 424,052 square miles in 1958.

Population.—In 1958, Bolivia had a population of 3,310,712, representing an increase of 291,681 over 1950, date of the last official census. The density is 7.8 persons per square mile. About 1,013,350 persons are classified as urban population, of which 65% live in the eight main cities. They are La Paz, the administrative capital, situated at an altitude of 11,909 feet (1957 est, pop., 339,279); Sucre, the legal capital (53,825); Cochabamba (87,159); Oruro (75,468); Santa Cruz (58,272); Potosí (51,065); Tarija (19,089); and Trinidad (12,807). The population increase in the urban areas was about 20% in the last two decades, while the rural population has decreased slightly.

The larger part of the population, about 63%, are Indians or follow an Indian way of life. Bolivia has about 87,000 nomadic forest Indians removed from all civilization and not included in census figures. Negroes and Asians together account for less than 0.5%. The rest of the population is European. Spanish is the official language, but Quechua, Aymara, and Guaraní are more widely spoken.

Government.—Bolivia is a unitarian republic with nine departments headed by prefects appointed by the president. The 12th constitution, adopted in 1938, revised in 1945 and amended in 1947, provides for executive, legislative and judicial branches. The president is elected every four years and cannot succeed himself; he can legislate by executive decree. (Hernán Siles Zuazo was elected president in 1956.) Congress is composed of 18 senators elected for 6-year terms and 68 deputies elected for 4-year terms. It convenes every year in August. Suffrage is obligatory. The Supreme Court has 10 justices appointed for 10 years by the president and approved by Congress.

Education and Religion.—About 69% of all persons over 6 years old are illiterate. Bolivia has 21,000 college graduates, 93,000 persons with high school diplomas, and 527,000 who have finished grammar school. In 1958 there were 698 primary schools with 165,598 pupils, and 138 high schools with 31,546 students. The 35 vocational schools have about 5,000 students; 40 kindergartens enroll 7,500 children. An additional 120,000 individuals receive partial education in the expanding rural school system. But 50% of school-age children fail to receive schooling, although the school population has increased at the rate of 12% to 15% each year. Seven universities enroll about 12,000 students. Roman Catholicism is the state religion, but freedom of worship is a constitutional right.

Finance.—The 1959 budget estimated expenditures at 368,875,821,000 bolivianos (Bs.), compared with Bs.-307,489,900,370 in 1958. (Bs.11,885 = U.S.$1.) Major expenditures are: education, Bs.43.9 billion; defense, Bs.-30.5 billion; foreign affairs, Bs.10.6 billion; and government and agrarian reform program, Bs.18.9 billion. Income from taxes is calculated at Bs.225.5 billion. United States aid is calculated to make up the budget deficit. The official foreign debt in 1958 was U.S.$61.9 million, but recent loans bring it unofficially to U.S.$100.3 million. The internal debt was Bs.427.7 billion. The amount of money in circulation in September 1958 was Bs.360.9 billion, as compared with Bs.363.5 billion in December 1957.

Transportation and Communications.—Bolivia has 9,806 miles of highways, but only 621 miles are all-weather roads. Of the 1,486 miles of railroad, 910 miles are privately owned. In February 1959 the Bolivian Railway Company, a British enterprise which had operated the

UPI; WIDE WORLD

(Left) **Bolivian President Hernán Siles Zuazo tries to calm anti-United States mob in La Paz on March 2. main trunk lines in Bolivia for 55 years, abandoned its investments after the government had constantly refused to grant rate increases and reductions in the number of employees. The government took over operating control of the railway on February 19. The national airline is Lloyd Aereo Boliviano (LAB), which in 1958 flew 145,875 passengers and carried 286,057,310 pounds of freight. Five foreign airlines serve Bolivia. The country's 40 radio stations serve 200,000 receivers. In 1957 there were 23,200 telephones, 11,236 passenger cars, 12,736 trucks, and 1,520 buses.

Economic Developments.—Bolivia continues to have the highest rate of inflation in the world. In June 1959 the cost-of-living index (1953 = 100) was 3,745, as compared with 3,304 in June 1958. The economic situation deteriorated further in 1959 due to a decrease in mineral exports, strikes, money shortage, expanding bureaucracy, confusion over United States aid, and grave political problems.

United States aid from 1953 to 1959 amounted to $137.3 million, including $20.4 million in 1959 and $22.5 million in 1958. These funds (and the Bolivian counterpart funds) were used for a variety of programs affecting the whole Bolivian economy. Part of the aid was earmarked for financing the Bolivian budget to reduce the grave fiscal deficit. Charges have been made that the United States financed up to 50% of the Bolivian budget. Anti-American riots in 1959 brought a temporary stop to United States aid. Later charges of waste, mismanagement, and confusion in the aid program brought a United States Senate investigation. The Soviet Union's offer of $60 million in aid to develop the Bolivian petroleum industry produced, in August 1959, much left-wing criticism of the government for not accepting the offer.

Mining.—Still the main source of income, mining production in 1958, especially of tin, declined dangerously. Average tin prices reached $1.0234 per pound in 1958, however, as compared with $0.9617 in 1957. The State Mining Agency (COMIBOL) operated at a $7 million loss in 1958.

BOLIVIA'S MINERAL OUTPUT, 1957–58

	1957		1958[1]	
	Metric tons	$U.S.	Metric tons	$U.S.
Tin	28,242	57,389,000	18,012	36,355,000
Lead	26,261	8,441,000	22,408	5,941,000
Zinc	19,666	5,407,000	14,220	3,227,000
Antimony	6,374	1,668,000	5,253	1,258,000
Copper	3,919	2,557,000	2,873	1,524,000
Tungsten	2,618	6,387,000	1,337	1,208,000
Silver	167	4,785,000	188	5,284,000
Gold	1,460[2]	1,643,000	593[2]	663,000
Petroleum	3,575,638[3]	...	3,455,610[3]	...

[1] Preliminary. [2] Fine kilograms. [3] Barrels.

Furthermore, petroleum production, which had shown considerable increase in recent years, in 1958 declined 3.9% from 1957. But three new foreign private oil companies began drilling in 1958. Bolivia in 1958 earned only $55,727,978 gross from the sale of all minerals, as compared with the annual average of $101,671,000 for the period 1953–57.

Agriculture.—Crop production in 1958 showed little gain from previous years, although Bolivia is doing its utmost to increase output. Chief crops and production figures (in metric tons) for 1958 are: rice, 10,000; barley, 55,000; corn, 110,000; potatoes, 155,000; wheat, 12,000; yucca, 60,000; and sugarcane, 500,000. Beef production has declined because of the often illegal entry of cheaper but better Argentine beef. Sheep raising has increased, and mutton production rose from 17,000 metric tons in 1957 to 25,000 in 1958. Although 65% of all Bolivians are engaged in agriculture, the value of agricultural output accounts for only 27% of the gross national product.

Manufacturing.—In 1958, Bolivian industry consisted of 1,200 factories with a capital investment of U.S.$130,000,000 and a work force of 21,000. Principal products are textiles, flour, glass, matches, cement, and cigarettes. In recent years the majority of the factories have operated on deficit financing. In November 1958 the government set up an industrial rehabilitation fund and an industrial credit fund. Total electrical generating capacity in 1958 was 124,833 kilowatts, including 90,833 kilowatts of hydroelectric power.

Foreign Trade.—Bolivia's exports in 1958 were valued at $63.1 million, representing a decrease of nearly 34% from the exported value in 1957; imports totaled $59.8 million, or a decline of 35%. About 90% of exports are minerals; major imports are manufactured goods and foodstuffs. Bolivia's chief customers are Great Britain, which in 1957 took 53% of the country's total exports; the United States, which received 34%; Argentina, 5%; and West Germany, 3%. Principal suppliers are the United States, which provided 47% of Bolivia's 1957 imports; and West Germany, which supplied 11%.

Principal Events, 1959.—The year was one of the most agitated in Bolivia's 134 years of stormy history. In the first five months over 500 strikes took place. By January 1959 the level of national production was only 36% of that in January 1958. A 27% salary increase for the whole labor force in January reactivated the galloping inflation, and the boliviano fell in value from Bs.9,145 per U.S.$1

in December 1958 to Bs.12,200 in July 1959. Strikes continued all through the year, even paralyzing the schools.

Bloody riots erupted in La Paz on March 2–3 and in Cochabamba and Oruro on March 4 in protest against the publication of an article in the Latin American edition (March 2) of *Time* magazine, which quoted an alleged statement by an unnamed United States embassy official that Bolivia should be "abolished" and divided up among its neighbors. The United States embassy and associated offices were attacked and suffered damages estimated at $70,000; embassy employees had to be evacuated to safer places. Violent strikes in the tin mines protesting the scheduled abolishment of state-subsidized discounts of 40% on commissary prices further aggravated the tense situation.

In February many opposition leaders of the Bolivian Socialist Falange (FSB) were imprisoned. In April an unsuccessful counterrevolution of the FSB broke out in La Paz, and its leader, Oscar Unzaga de la Vega, lost his life. On June 26 a violent and unsuccessful uprising in Santa Cruz showed secessionist tendencies when members of government peasant unions from the mountains invaded the town and committed some atrocities. A peasant uprising also occurred in Tarija, which was isolated from the republic for some time.

In the meantime the governing National Revolutionary Movement (MNR) approached the presidential elections of 1960 with divided ranks. The party convention scheduled to meet in mid-1959 was postponed several times because of a serious split in the party between leftist and rightist elements. Ex-President Victor Paz Estenssoro (1952–56) had the tacit support of the left wing, while Walter Guevara Arce led the right wing.

Bolivia achieved international cultural recognition when 17-year-old violinist Jaime Laredo won the Belgium International Music competition in 1959.

BOOK PUBLISHING AND SALES. One of the most noteworthy events of the 1959 book-publishing year occurred in the field of censorship, following the publication of an unexpurgated edition of *Lady Chatterley's Lover.* The United States postal authorities banned the book from the mails as obscene, whereupon U.S. District Judge Frederick vanPelt Bryan in New York took his place in literary legal history alongside Judge John M. Woolsey (granter of customs entry and freedom of sale to James Joyce's *Ulysses*) when he reversed the postmaster general's exclusion of the D. H. Lawrence book from the mails. *Lady Chatterley's Lover* went immediately to the top or near top of all best-seller lists throughout the country. This new-won freedom of distribution, enjoyed for the first time since the book was published in the mid-1920's, led several paper-back book publishers to rush into print with over a million copies of competing "unexpurgated" editions. (See also CENSORSHIP.)

In 1959 many distinguished books achieved record-breaking sales and comparatively long life on such best-seller lists as those of the New York *Times Book Review* and *Publishers' Weekly,* the leading trade journal of the industry. It might be noted in passing that there seemed to be a tendency in fiction toward longer books, and hence toward higher prices for them, although retail prices generally remained unchanged.

At the end of January 1959, the fiction best-seller list continued to be dominated by a hold-over from the year before, Boris Pasternak's *Doctor Zhivago,* with Vladimir Nabokov's *Lolita* still very much in evidence. The extraordinarily long-lived *Exodus* by Leon Uris, and *The Ugly American* by William J. Lederer and Eugene L. Burdick were among the first six in the New York *Times'* list in January, and they were still there in December. Allen Drury's *Advise and Consent,* John Hersey's *The War Lover,* and Taylor Caldwell's *Dear and Glorious Physician* were worthy of note; and as the year came to a close, novels by William Faulkner (*The Mansion*) and James Michener (*Hawaii*) were climbing fast on the best-seller lists.

In nonfiction or general literature, Harry Golden's name appeared on all lists both at the beginning and end of the year. His *Only in America* led the field in the early months of 1959, to be replaced by his second best-seller, *For 2¢ Plain,* which was published in midyear and which remained among the top six. Harry and Bonaro Overstreet's *What We Must Know About Communism* and Alexander King's *Mine Enemy Grows Older* figured prominently on the nonfiction list for many weeks at midyear, the sale of the latter helped by the author's television appearance. Both Vance Packard's *The Status Seekers* and *Act One* by the American playwright, Moss Hart, were immediate best-sellers. D. C. Jarvis's *Folk Medicine* and William Nickerson's *How I Turned One Thousand Dollars into a Million in Real Estate—in My Spare Time* had wide appeal, the former establishing itself as a best-seller after half a year of steadily rising sales.

On the international scene the American and Soviet national exhibitions in Moscow and New York brought Americans and Russians into direct contact with each other's book production for the first time. The original supply of books sent to Moscow by the United States was so avidly examined that it had to be replaced by a duplicate shipment of books donated by private American citizens and dramatically flown to Moscow just before the closing of the fair. Other international book fairs, such as those at Leipzig, Frankfurt, and Tokyo, helped American book exports to increase 5% over the year before, reaching an estimated $48 million.

In 1959 the National Book Committee and the American Library Association (q.v.) again sponsored National Library Week, April 12–17, enlisting the support of communities throughout the country and using television, the lecture platform, newspapers, and magazines to put across its message, "Wake Up and Read," and to restore books to their rightful place as familiar household objects. The National Book Committee agreed to administer the National Book Awards for 1960, thus serving as a clearinghouse for the bookseller-publisher-printer sponsors.

The dollar sales volume of books in the United States continued to climb in 1959 by an estimated 3% over 1958—a year in which book sales showed a remarkably strong rise in spite of the recession. Paper-back books were still further integrated in regular bookstore selling, and publishers continued to foster this trend by offering some of their better backlist titles in the so-called "quality" lines, in attractive paper-cover format at attractive prices. Backlist titles that formerly enjoyed sales of 2,000 to 3,000 a year now found 10,000 to 20,000 purchasers.

The number of titles published in the United States in 1959 totaled 14,876, as compared with 13,462 in 1958. Numbers of titles, by category

(with comparative totals for 1958 in parentheses), were as follows: fiction, 2,437 (2,235); philosophy and ethics, 454 (447); religion, 1,125 (1,050); technical, 736 (548); juvenile, 1,647 (1,522); and general literature and criticism, 836 (626). The total dollar figure for book distribution in all branches of the book industry was estimated at over $1 billion.

JOSEPH A. DUFFY,
Executive Director,
American Booksellers Association, Inc.

BORNEO. Largest island of the Malay Archipelago and third largest in the world, Borneo (area, 286,916 square miles) lies on the equator north of Java. Kalimantan (former Netherlands Borneo) became part of Indonesia in 1949 and occupies 208,232 square miles of southern Borneo. The remainder (78,684 square miles) constitutes British Borneo, which in turn comprises Sarawak, the protected sultanate of Brunei, and North Borneo. The last named includes Labuan (area, 35 square miles; pop., 8,784 in 1951) with its capital, Victoria (2,526), and smaller islands. Sarawak divides Brunei into two enclaves on the northwest coast.

The areas, populations, and capitals of the components of British Borneo are as follows:

	Area (sq. mi.)	Population	Capital
North Borneo[1]	29,387	416,436[2]	Jesselton (11,704)[3]
Sarawak	47,071	654,656[4]	Kuching (60,000)[5]
Brunei	2,226	74,646[6]	Brunei (16,000)[7]
Total	78,684[8]	1,145,738	

[1] Includes Labuan. [2] Dec. 31, 1958. [3] 1955. [4] Est. mid-1958. [5] Est. mid-1956. [6] Dec. 31, 1957. [7] Est. 1955. [8] Excludes tidelands.

A standing conference of the three territories, established in 1953, is presided over by the commissioner general for Southeast Asia (Sir Robert Heatlie Scott).

The Malayan dollar (M$) equals 32.6667 U.S. cents.

NORTH BORNEO

The administration is under a governor (Sir Roland Evelyn Turnbull; assumed office on March 4, 1954), who is assisted by a 9-member Executive Council and a 22-member Legislative Council. Ordinary revenue in 1958 was M$37,583,797; ordinary expenditure, M$36,659,851. Revenue under the development budget totaled M$25,364,744; expenditure, M$25,361,848, financed by Colonial Development and Welfare funds, loan proceeds, and colony funds.

There are 88 government and 224 grant-aided primary schools, and 4 government and 20 grant-aided secondary schools; 18 of the grant-aided schools are maintained by local authorities, which in 1958 raised M$153,895 toward their maintenance. The government also maintains a trade school and a teacher-training college and conducts adult evening classes in science and languages. Primary education is provided in Malay, Chinese, English, and, to some extent, in Kadayan, the language of the largest indigenous community; secondary education is provided principally in English and Chinese. In 1958 the enrollment in primary schools was: Malay, 12,158; Chinese, 13,903; and English, 11,515. There were 2,257 pupils in English secondary schools and 762 in Chinese secondary schools. Expenditure on education from colony funds was M$2,092,326 in 1958.

More than 23,600 square miles are forested; in 1958 26,300,000 cubic feet of timber, valued at M$36,400,000, were exported. Domestic production of paddy was 46,591 tons, equivalent to 28,886 tons of rice, valued at M$9,785,000. Imports of rice totaled 21,900 tons, valued at M$11,700,000. In 1958 rubber production reached 29,790,400 pounds; 20,235 tons, worth M$32,623,867, were exported. Other products were coconuts, 60,515,000 pounds (67,542 tons, valued at M$35,317,427, exported, including re-exports of copra amounting to 54,617 tons); and manila hemp, 7,091,000 pounds (2,400 tons, valued at M$2,423,000, exported). Total exports in 1958 amounted to M$130,441,075; imports, to M$128,490,413.

A 116-mile railway connects Jesselton with Melalap by way of Beaufort, and a branch line extends from Beaufort to Weston on Brunei Bay. In 1958 there were 295 miles of metal roads and 427 miles of earth roads. Malayan Airways makes daily flights between Singapore and North Borneo and also provides internal air service. Qantas Empire Airways links North Borneo and Labuan with Hong Kong and with Sydney, Australia; Cathay Pacific Airways operates weekly service to and from Hong Kong and Manila. The principal towns, situated on or near the coast include Sandakan, the largest city (1951 pop., 14,499); Jesselton, the capital; Labuan; and Tawau (1955 pop., 4,282).

BRUNEI

Under the written constitution promulgated for the sultanate on Sept. 29, 1959, the post of British resident is abolished, his powers devolving on a *menteri besar* (chief minister). Defense and external relations, however, are the responsibility of a resident British high commissioner. The chief minister is scheduled to preside over an enlarged Legislative Assembly of 33 members, of whom 16 are elected. Supreme authority is vested in the sultan, Sir Omar Ali Saifuddin (acceded on June 6, 1950), sitting as president of the 15-member Executive Council, which comprises ex-officio, official, and nominated members.

Revenue for 1959 was estimated at M$126,596,630 (principally from petroleum revenues); expenditure, at M$75,851,967.

At the end of 1958 the aggregate enrollment in 65 schools, including 47 Malay vernacular, 8 Chinese vernacular, 6 private, and 3 government English schools and 1 trade school, was 15,236. The first girls' school to be completed in Brunei was opened in 1957.

Brunei depends primarily on its oil industry, which employs three fourths of the working population; makes possible liberal social benefits, including pensions to all citizens at 60; and finances, a 5-year, M$100 million development program. Production of crude oil by the Brunei Shell Petroleum Company at Seria (the largest oilfields in the British Commonwealth) averages 110,000 barrels a day.

At the end of 1958 there were 260 miles of state roads and 67 miles of oil company roads. Malayan Airways provides service to North Borneo, Sarawak, Singapore, and Malaya; Borneo Airways operates a feeder service to North Borneo and Sarawak. Facilities at the Brunei Airport are the most modern in Borneo; its runway of 5,325 feet receives an average of 280 flights a month.

SARAWAK

As of June 30, 1958, Sarawak's population of 654,656 included 200,110 Sea Dayaks, 200,692 Chinese, 160,369 Malays and Melanaus, and 51,011 Land Dayaks and other indigenous persons; Europeans numbered 2,372.

A governor (Sir Alexander Waddell; scheduled to succeed Sir Anthony Foster Abell late in 1959) is assisted by a Supreme Council consisting of 3 ex-officio members, 2 nominated members, and 5 other members elected by the Council Negri. The latter body is legislative in function and comprises 45 members (24 elected).

Recurrent budget estimates for 1959 were: revenue, M$52,236,500 (M$50,201,000 in 1958); expenditure, M$51,519,100 (M$50,121,000 in 1958).

In September 1958 there were 794 primary and secondary schools with 90,932 pupils in attendance. These comprised 723 government and government-aided primary schools, which enrolled 80,302 pupils; 34 unaided primary schools, with 1,914 pupils; and 37 secondary schools (2 unaided), with 8,716 students. There were also 3 teacher-training schools with 405 students. Expenditure on education was estimated at M$9,892,832 in 1959.

The cultivation of rubber is increasingly important, but oil refining remains the only major industry; production at the Sarawak Shell Oilfields, Ltd., in Miri totaled 57,840 metric tons in 1958. The mining of bauxite ore was begun in April 1958; by the end of that year, 100,000 tons of ore had been exported. The colony's forests produced M$15,734,178 in timber export revenue in 1958.

In 1958 total exports were valued at M$463,736,226, including petroleum (mostly reshipped from Brunei), M$347,498,004; rubber (38,542 tons), M$60,430,509; and pepper, M$15,143,620. Imports were valued at M$433,786,897, including foodstuffs, M$33,607,460; petroleum, M$301,186,780; and manufactured goods, M$20,521,108. Rice imports totaled 38,275 tons.

The colony has no railways, communication being principally by sea and on numerous rivers. In 1957 there were 557 miles of roads (220 miles surfaced). Scheduled domestic and international air services use Kuching, Sibu, and four other airports. There are also a number of small airports for internal use on nonscheduled flights.

DONOVAN ROWSE,
Author and Publicist.

BOSTON. Chief metropolis of New England and most populous capital city in the United States, Boston, Mass., is one of the smallest in area (47.8 square miles) of any large American city. Its population is 724,702 (1955 state census), and that of the Boston metropolitan area is 2,369,986 (1950 federal census).

The city charter provides for a mayor elected for a four-year term and for a City Council of 9 members elected at large and without party designation for two-year terms. The city's School Committee of 5 members elected for two-year terms has absolute control of the school department. Its budget must be approved by the mayor, but he may not reduce it.

The city budget for 1958 provided for the expenditure of $106,711,678. Tax rate (1958): $93 per $1,000 on assessed valuation of $1,475,608,000. Gross debt (Oct. 1, 1958): $174,531,500; net debt: $112,474,196. Tax rate (1959): $101.20 per $1,000.

Average enrollment in public schools in September 1959: 88,786 (elementary and junior high, 58,945; senior high, 19,728; kindergarten, 9,494; and special schools, 619). Enrollment in the schools of the Archdiocese of Boston: 117,768 elementary and 30,205 high school pupils.

Shipments through the Port of Boston (July 1958-June 1959): 5,678,022 import tons and 418,396 export tons. Value of products manufactured in 1957: in city, $1,352,407,117; in Greater Boston, $3,104,502,794. Employed production workers (August 1959) in Boston area: 294,900 (average weekly earnings, $86.58). Consumer price index (July 1959): 125.6 on a 1953 base of 100.

Economic highlights in the Greater Boston area in 1959 included the recovery of the wholesale and retail trade industries from the previous year's slump; the accelerated expansion of industrial and commercial construction, especially of electronic plant and research facilities; and, in downtown Boston, continued acceleration of varied new construction projects.

The $100 million Prudential Center in the Back Bay area was started in April. Plans call for the center, scheduled for completion in 1963, to include a 52-story tower office building, six 25-floor apartment houses, a 25-story hotel, commercial buildings, a civic auditorium, and a 3,500-car garage.

A new $12 million *Herald-Traveler* Building in the industrial redevelopment of the 16-acre South End tract was occupied in July. Included in plans for this area are several multistory office buildings and a number of light industrial and commercial plants. A contract for lease of a $30 million, 16-story state office building to be built in the new government center in the Scollay Square section was signed in September. Other units include a $20 million city hall and a $30 million federal building. In the West End section, demolition was under way in preparation for the establishment of a beautifully integrated 45-acre community which is to feature apartment dwellings.

City officials hope that Boston's great era of building and rebuilding will stem the population exodus to the suburbs, help push the city's valuation to a sound base and thereby halt the rising tax rate, and relieve the city of the costly problems connected with urban blight.

The annual Boston Arts Festival (June 5–21) featured productions of ballet, opera, and drama, and numbered among its arts and crafts exhibits an invitational exhibition of photography and a group of notable European sculptures. The festival's $1,000 grand prize was awarded to Gilbert Franklin's *Beach Figure*, a bronze sculpture.

On July 9 the tent theater of the newly established nonprofit Metropolitan Boston Arts Center opened its first season. The center, built along the Charles River in Brighton by the Metropolitan District Commission, also includes an art gallery, and a 3,500-seat opera house is planned as one of its permanent facilities.

Educational institutions in the Boston area continued to undergo physical expansion in 1959. Under construction were a $3 million research building for Boston University and a $1 million, three-unit center for the social sciences at Brandeis University. Northeastern University dedicated its $1.5 million graduate center on September 8, the same day that its third president, Dr. Asa S. Knowles, was inaugurated. Massachusetts Institute of Technology inaugurated its 11th president, Dr. Julius Stratton, on June 15. The institute has launched an extensive program for the exchange of technical data with Russian libraries and has become the New England depository for translations of Russian scientific and technical journals. Along with Harvard University, it received a National Science Foundation grant for the study of the ionosphere and problems it presents for space travel.

The Old Colony division of the New York, New Haven and Hartford Railroad ceased operations on July 1. Thousands of South Shore commuters were without adequate mass transportation facilities to Boston. (See also MASSACHUSETTS—*Legislature.*)

John B. Hynes, mayor for a decade, did not seek re-election in 1959. Democrats John E. Powers, president of the state Senate, and John F. Collins, register of probate for Suffolk County, won nominations from a field of five in the September primary, preparatory to the nonpartisan election of November 3. The surprise election victory of Collins, by a margin of 114,210 to 90,142, despite the backing of his opponent by most of the state's powerful political leaders, was interpreted partly as a taxpayers' revolt and partly as a rejection of machine politics.

DENNIS A. DOOLEY,
Massachusetts State Librarian.

BOTANY. By consulting the *Proceedings* of the Ninth International Botanical Congress, volumes 2 and 2A (Montreal 1959), the scope and depth of botanical research in the last year may be readily appreciated and measured.[1] Botanists throughout the world attended the congress and presented and discussed some 1,200 papers in 14 sections, covering nomenclature, systematics, phycology, mycology, phytopathology, bryology, microbiology, morphology and anatomy, taxonomy, paleobotany, physiology, ecology, cytology and genetics, and forest botany.

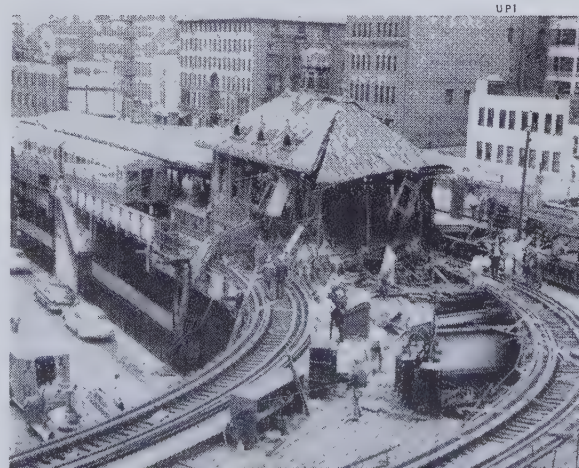
Electron Microscopy.—Prior to 1959 much had been discovered about the fine structure of the cell wall and protoplast in plant and animal cells. In plants, the cellulose architecture of the wall consists of a meshwork of microfibrils arranged in a variety of patterns, while the cytoplasm contains mitochondria, plastid initials or protoplastids, Golgi bodies, and a complex platelike endoplastic reticulum which may be attached to the nucleus. New techniques devised for use with the electron microscope have given rise to a new field of biological study known as submicroscopic morphogenesis. Some of the discoveries reported at the abovementioned congress will be described briefly.

For example, pores in the nuclear membrane are not built into the membrane as are windows in a brick wall, but are shown to develop after the membrane is completely formed (K. R. Porter). Cell organelles are remarkably similar in their early stages of development; mitochondria, plastid initials, Golgi bodies, and the endoplastic reticulum begin growth through the invagination of the surface membrane. Also, when analogous organelles appear in animal and plant cells, their structure

[1] Research reported at the congress forms the basis for this article; for further details consult the *Proceedings* under names of the authors cited in the text.

Bomb placed in a locker of elevated railroad station in Boston exploded on June 11, injuring 36 and wrecking platform.

UPI



and development are more or less the same (K. Mühlenthaler).

Chloroplasts, the seat of photosynthesis, pass through three stages of development from undifferentiated protoplastids to lamellated plastids and finally to multilamellated plastids containing piles of chlorophyll-bearing grana (A. Frey-Wyssling).

The primary wall appears to grow through the deposition of cellulose microfibrils near the inner surface of the wall; these are oriented transversely to the long axis of the cell but later are reoriented, often in a spiral pattern. The problem here is to discover the physiological basis for deposition in a transverse rather than in a longitudinal direction and also for subsequent reorientation (P. B. Green).

Electron microscopy has so advanced our knowledge of cell organelles that it is believed that in some parts of the plant kingdom they may be employed very effectively for purposes of classification (Irene Manton).

Physiology.—The discovery of the submicroscopic structure of the cell has made necessary a revision of the classic concepts of the factors responsible for coordination of metabolic activities within the cell. Mitochondria, protoplastids, the endoplastic reticulum, and other organelles are the seat of individual enzymes and enzymatic systems which influence each other and the activity of the surrounding cytoplasm. Likewise, as might be expected, changes within the fine structure of these organelles are reflected in the activity of cells and tissues. Only a beginning has been made in understanding the role of fine structure of the cell in the utilization and release of chemical energy (G. G. Laties).

Photosynthesis.—Plant physiologists have new evidence from recent experiments with isolated chloroplasts which indicates that the energy conversion process during photosynthesis takes place through two photochemical reactions in cyclic and noncyclic photophosphorylation. Adenosinetriphosphate (ATP), reduced triphosphopyridine nucleotide ($TPNH_2$), and oxygen are the products of these reactions. The assimilation of carbon dioxide to the level of carbohydrate requires both ATP and $TPNH_2$, which are richly stored with the energy of sunlight. This is a major step in solving the key problem in the transfer of light energy into chemical energy (D. I. Arnon).

Root-Grafts.—These have been known since the time of Theophrastus (d. about 287 B.C.), but only now has their full significance been appreciated in plant succession, competition, and composition of plant communities. Apparently forest trees are commonly interconnected through root-grafts, and stumps and root systems of cut trees remain alive through food obtained from living trees by way of root-grafts. Large trees may be more successful in obtaining material from the root-graft complex than smaller ones, which suffer perhaps not only from competing roots of other species or from reduction of light in the forest, but from competition within the closed root-graft system of individuals of the same species (F. H. Bormann).

Classification.—Taxonomists, who are largely concerned with classification and the evolutionary history of plants, have been frequently criticized for limiting their studies to morphological (structural) characters seen through a hand lens or the microscope. One of the highlights of the Ninth International Botanical Congress was a series of meetings sponsored by grass specialists for devising a natural classification of grasses which would more nearly reflect the interrelationships of the family than the system now in use.

An evaluation and synthesis of evidence was attempted from morphological, physiological, geographical, and biochemical investigations. In placing species and genera within the grass family, an assessment was made of embryo structure and development, seedling form, leaf development and anatomy, caryopsis (fruit) form, epidermal and flower structure, chromosomal characteristics, polyploidy, reaction of germinating seeds to herbicides, and serological correspondence of seed proteins. Unsolved problems accruing from the mass of available data are to be studied further during 1959–60, after which the new classification will be issued. This is the first time within the history of classification in which evidence from such a broad spectrum of research has been focused on the possible evolutionary history of such a large and important family.

BOWLING. See SPORTS, GAMES, AND SHOWS.

BOXING. See SPORTS, GAMES, AND SHOWS.

BRAZIL. Although its 3,287,195 square miles of territory occupy nearly half (47.3%) of South America and its borders touch those of all but 2 of the other 12 countries and colonies on the continent, Brazil looks to the sea. Most of the nation's 64,678,709 people (est. July 1, 1959) live close to its 4,603-mile Atlantic coastline, in such great cities (from north to south) as Belém (pop., 1958 est., 302,800), Fortaleza (375,600), Recife (733,900), Salvador (551,500), Belo Horizonte (535,000), Rio de Janeiro (the capital until April 1960, 3,030,600), São Paulo (3,515,600), and Pôrto Alegre (532,600). Brasília, the capital from April 1960, had a population of 65,288 in 1959.

Government.—Brazil is a federal republic of 20 states, 5 federal territories, and the Federal District of Rio de Janeiro. Heading the executive branch of the government are President Juscelino Kubitschek de Oliveira and Vice President João Goulart, who began their 5-year terms on Jan. 31, 1956, and are ineligible for re-election to consecutive terms. The National Congress is composed of a 63-member Senate (3 senators from each state and the Federal District) and a Chamber of Deputies whose 326 members are elected under a system of proportional representation; they serve 8- and 4-year terms, respectively. The federal judiciary is composed of a Supreme Court, the Federal Court of Appeals, and the usual minor courts.

Religion and Education.—Most Brazilians (93% in 1950) profess the Roman Catholic faith, but freedom of worship is allowed to all.

Primary education is free and compulsory between the ages of 7 and 14, but many Brazilians seem to have ignored the law: only 5,406,251 pupils were enrolled in elementary schools in 1957. Other enrollment figures of that year include 903,559 students in secondary (including industrial, commercial, and normal) schools, and 79,505 in institutions of higher learning.

Finance.—The deficit in the government budget for 1958 was 34.4 billion cruzeiros. Revenue was 117.8 billion; expenditure, 152.2 billion. The 1959 budget anticipated revenue of 147,671,328,000 cruzeiros, expenditure of 156,226,544,000, and a deficit of 8,555,216,241, to which would have to be added the additional expenditures resulting from wage readjustments granted to civil servants and the military. The income tax collected in 1958 totaled 33.5 billion cruzeiros; paying the tax were only 369,101 individuals and 248,749 firms, of which only 353 admitted earnings of more than 3 million cruzeiros.

Inflation continued to be a serious problem in 1959. By November 5, currency in circulation had risen to 140 billion cruzeiros, and the value of the free cruzeiro had declined to a record low of 193 to U.S.$1. Talks with officials of the International Monetary Fund were discontinued in June because of Brazilian reluctance to adopt anti-inflationary measures. Although no new loans were received to help cover the deficit in the balance of payments, repayment of earlier loans was postponed by the United States.

Transportation and Communications.—Although Brazil's 22,989 miles (1956) of railways are concentrated in the four states of São Paulo, Rio de Janeiro, Minas Gerais, and Rio Grande do Sul, because of the poor condition of both track and equipment the federal railway program for 1959 was still one of renewals and improvement of the present

network. Similarly, the main emphasis of the road program is on keeping passable the roads already in use and in opening new dirt roads. In 1956, Brazil had 290,458 miles of roads, to which 1,253 miles were added in 1957, when 349 miles were also paved. The most important single construction project started in 1958 was the 1,367-mile highway between Belém and the new capital, Brasília. On Feb. 1, 1959, crews which had been working from each end met to complete the work of cutting through the road, which was scheduled for completion in April 1960. Next in importance in the 1959 program was completion of the 357-mile highway between Belo Horizonte and São Paulo. At the end of 1958 there were 808,000 motor vehicles in Brazil.

Maritime and river traffic in 1958 involved 35,861 landings with an aggregate tonnage of 56,375,000, of which 14,000,000 tons were handled at Santos and 13,000,000 at Rio de Janeiro. To ease the immediate shortage of shipping, foreign vessels were authorized to engage in coastal trade through 1959, while Brazil awaited the delivery of 14 ships ordered in 1958 from Poland.

With its great distances and poor surface transportation facilities, Brazil has been a pioneer developer of air transport. Its VARIG line is one of the largest in the world; among other leading lines of some 30 domestic and foreign companies operating in Brazil are Real-Aerovias-Nacional, Panair do Brasil, and Cruzeiro.

In 1958, Brazil had 869,800 telephones. There were 7 television stations—3 in São Paulo, 2 in Rio de Janeiro, and 1 each in Belo Horizonte and Santos—while the first station in the south went into operation in Pôrto Alegre in 1959.

Agriculture.—The year 1958 was marked by sharply increased coffee production and softening prices, a serious drought in the northeastern states, and wheat production setbacks resulting from weather and disease. Not only did the drought cause financial losses, but the crops that were poor were such basic food items as rice, corn, and beans. The wheat crop amounted to only 15 million bushels, that of potatoes to 980,000 metric tons, and that of rice (1958–59) to 8,200 million pounds. In April 1959, there were disastrous floods which destroyed 15% of the rice crop and caused heavy losses of cattle in Rio Grande do Sul in addition to the loss of 1.5 million to 2 million sheep. Coffee, on the other hand, was in too plentiful supply in 1958–59, with an exportable production of 26 million bags of 132.276 pounds each; despite a Latin American export control agreement, prices were down, and the export quota set for Brazil meant withholding 40% of its output from the world market. The 1959–60 exportable crop was estimated at 30 million bags. Three other export crops in abundant supply were cacao, sugar, and bananas. In 1958–59, 383 million pounds of cacao and 4,060,000 short tons of sugar were produced, and the 1958 banana harvest was a record 13,480,244 stems. Production of cotton increased from 1,350,000 bales in 1957 to 1,400,000 in 1958.

Industry.—Brazilian industry made good gains in 1958 despite shortages of such materials as rubber, steel, and cement. Production amounted to over 500 billion cruzeiros, and gross profits to 90 billion; the number of factories was placed at 160,000, with a labor force of more than 2 million and wages totaling about 350 billion cruzeiros. The textile industry recovered from the crisis of 1957, motor vehicle production exceeded 60,000 units, electric power capacity reached 3,850,000 kw., and the steel output was up to 1,500,000 metric tons.

Industrial output rose by 8% in the first half of 1959. In the first 4 months an average of 104 new firms were established monthly, with invested capital of 1,441 million cruzeiros, and 27 billion cruzeiros in new stock offerings were issued. About three fourths of the total represented capital increases of expanding firms.

Among important power developments underway with large financial grants in 1959 were the Furnas and Peixoto projects on the Rio Grande, Três Marias on the upper reaches of the São Francisco, and the São Paulo state development program. A loan of $11.6 million for improvement of facilities was received by the Canadian-owned Brazilian Traction, Light and Power Company from the International Bank for Reconstruction and Development. The Cachoeira Dourada project completed its first stage, whose 29,500-kw. capacity was to be used in Minas Gerais and Goiás, notably for Brasília. One subsidiary of the American and Foreign Power Company, in Minas Gerais, decided to install 10 diesel generators when presented with the alternative either of an improved power supply or of expropriation by the state government—a fate which had befallen the subsidiary in Rio Grande do Sul.

UPI

Ferry terminal at Niterói, Brazil, across the bay from Rio de Janeiro, is burned by enraged commuters on May 22 after disruption of ferry service because of a strike.

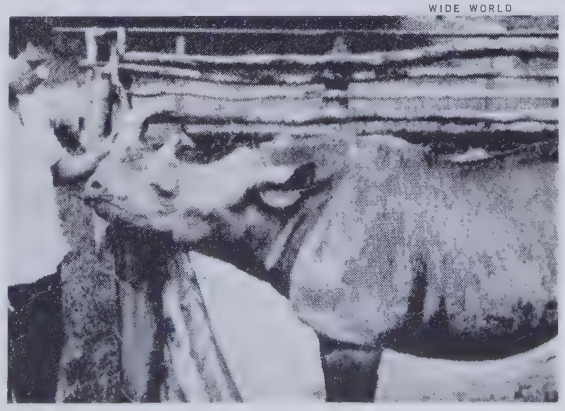
In 1958 the Volta Redonda plant of the National Steel Company contributed 811,491 metric tons of steel ingots to the national total; among its other products were 507,822 tons of coke, 645,809 tons of pig iron, and 621,741 tons of metal plates and sheets. The 1959 total national steel production was forecast at 1,750,000 metric tons.

Newest and fastest growing (a phenomenal 99.1% in 1958) of Brazil's industries is the automotive industry, which turned out 62,707 units, including 35,369 trucks, 361 buses, 14,216 jeeps, 5,119 passenger cars, and 7,642 utility vehicles, in 1958. Inaugurated during the year were 297 auto parts firms. In the first 6 months of 1959, 45,711 units were produced, and by July 100 jeeps a month were being exported to Chile.

Among other industries, in 1958 there were 23 cement factories (with 4 under construction) which produced 3,769,168 metric tons of cement. Production of pulp rose to 336,000 metric tons, and that of paper to 380,537 tons. The nation's appliance industry, which scarcely existed in 1955, turned out 21,000 vacuum cleaners, 50,000 washing machines, 135,000 floor waxers, 150,000 tel-

This rhinoceros, Cacareco, won the São Paulo municipal elections by a landslide. Her write-in victory in the October 4 voting was seen as a popular protest against politicians, but Cacareco was disqualified as a nonresident.

WIDE WORLD



evision sets, 200,000 refrigerators, 300,000 electric mixers, 631,000 sewing machines, and 660,000 radios. In support of the rubber industry, which suffers from its dependence on imports for materials, a quota of 36,000 tons of raw rubber to be acquired in 1959 by manufacturers was exempted from import duties. The replacement of stocks was not possible, however, because of the demands of the automobile industry, which produced 1,985,000 tires for trucks and cars in 1958.

Mineral Products.—Because of reduced demand from the United States and increased availability from other sources, exports of iron and manganese declined in 1958. The Companhia Vale do Rio Doce, which produces over half of Brazil's iron ore and which in 1957 exported 2,966,260 metric tons of hematite, exported only 2,240,000 tons in 1958, when its sales to the United States fell to 691,000 tons from the 1,140,000-ton high of 1957. Similarly, the 1958 manganese exports from Amapá, supplying three fourths of Brazil's production, brought in only $35 million in 1958, when shipments to the United States declined to 852.1 million pounds (valued at $20.6 million) from the 1,327.5 million pounds ($28.7 million) of 1957.

Three new ore deposits were found or confirmed in 1959: lead and copper, both in Rio Grande do Sul; and bituminous coal, at Curiúva in Paraná. About 65% of the coal now produced in Brazil comes from Santa Catarina's 70 mines, but the quality is poor. Zinc reserves, too, are known in Brazil, but it has not been commercially feasible to develop them, and the country has imported its annual needs of 35,000 metric tons. In 1959 plans were made for the nation's first zinc industry, to be financed by the National Economic Development Bank.

Oil is Brazil's great mineral need, and in 1958 the country spent an estimated $346 million on oil imports to supplement the 18,922,738 barrels produced in Bahia. For 1959 the country needed 86.5 million barrels, of which the government agency, Petróleos Brasileiros, S.A. (Petrobras), was expected to supply 25 million, with the remainder to come from Venezuela and Kuwait. In the first half of the year the output in Bahia was 10,355,408 barrels, and $131.4 million worth of oil was imported.

Foreign Trade.—Because of reduced shipments, with lower prices, of coffee, and declines in raw cotton, iron and manganese ore, and pine lumber, Brazil's exports decreased in value in 1958 to $1,243 million; imports, valued at $1,353 million, left a negative balance of trade of $110 million. Among the imports, those from the United States, valued at $537.6 million, included industrial machinery ($142,650,000), electrical machinery ($33,777,000), railway transportation equipment ($43,140,000), automobiles and parts ($18,906,000), iron and steel mill items ($17,148,000), and industrial chemicals ($8,125,000).

In the first 6 months of 1959 exports were valued at $577 million; imports, at $712.5 million. Though coffee prices fell, a 28.7% increase in the volume of sales (7,462,000 bags) yielded $321 million; sugar earnings totaled $26 million; and petroleum shipments expanded to $15 million. The most significant decreases occurred in the earnings from cotton (down from $16.4 million in the first 6 months of 1958 to $0.5 million) and ores (manganese shipments declined from $14.9 million to $10 million).

Principal Events, 1959.—Abroad, Brazil was represented in 1959 at a series of meetings held in Washington that led on April 8 to the initialing of the charter of the new Inter-American Development Bank; in the conferences (April 27–May 8) of the Committee of 21 held at Buenos Aires to consider plans for the amelioration of Latin American economic problems; in a series of meetings for the establishment of a free trade market in South America; and in the Washington meetings that led to a new coffee export limitation agreement (September 24). Brazilian tennis star Maria Esther Bueno won the women's singles title at Wimbledon, England, on July 4, and on September 13 she also became the women's champion of the United States at Forest Hills, N.Y.; and Brazilians competed with distinction in the Pan American games held at Chicago on August 27–September 7.

At home, Brazilians were preoccupied with labor difficulties and politics. The first occurred from March to May and in September. The strikes which on April 8 were described as having plagued the nation at the rate of one a day for the past month centered in Bahia and Pernambuco, where there were short walkouts by transport workers and dockers, but there were also strikes in the south —the strike of employees on the Paulista railroad (April 15–28) and dock strikes at Santos—as well as riots at Niterói in May over the sudden halt in ferry service to Rio de Janeiro across the bay. In September, labor unrest over food shortages and high prices led to the new wage demands by 280,000 workers in the Federal District and by many more in the São Paulo area.

The year's political interest centered on the announcement of candidates for the 1960 presidential election: Janio Quadros, former governor of São Paulo, for the National Democratic Union; Vice President João Goulart, for the Brazilian Labor Party; and Marshal Henrique Teixeira Lott, for the Social Democratic Party. Brazilians also noted with chivalrous regret the resignation on May 1 of Clare Boothe Luce from her designated post as United States ambassador to their country. They gave exuberant expression of their opinion of politicians when, in an October 4 election for seats on the Municipal Council of São Paulo, they concluded that Cacareco, a rhinoceros that had visited the city from the Rio de Janeiro zoo, would be an improvement over any of the listed candidates. She promptly was made a write-in candidate, winning an enthusiastic 102,620 votes, far more than her closest competitor, only to be disqualified as a nonresident. Her election was a typically Brazilian gesture and was noted with sympathy in other lands. Political dissatisfaction also found a more sober expression in the abortive December 3–4 rebellion of a few air force officers, who charged that graft and communism were prevalent in the government.

BREWING INDUSTRY. Beer sales for the fiscal year 1959 in the United States totaled 85 638.270 barrels, representing an increase of 1,689,734 barrels, or 2%, over the 1958 total and the fourth highest figure for any fiscal year (the record was 86,992.795 barrels in 1948). This gain was registered despite curtailment of malt beverage production as a result of temporary work stoppages in several important brewing centers during 1958.

The trend toward packaged beer, which has been maintained over the past decade, continued in 1959. Packaged beer, in the fiscal year 1959, accounted for 79.9% of total sales—a new high. By contrast, packaged beer accounted for 25% of total sales in 1934 and approximately 10% in 1914, when per capita consumption hit the peak of 21

gallons (15 gallons in 1958). Of the 67,169,838 barrels of packaged beer sold in the calendar year 1958, 38%—a record high—was distributed in cans, 56.4% in returnable bottles, and 5.6% in one-way (no-deposit) bottles.

In the fiscal year 1959, brewers paid $387 million for cans, bottles, and crowns, plus some $250 million for brewing ingredients, $465 million for wages and salaries, and many more millions for other goods and services.

For the sixth consecutive year, beer was a billion-dollar producer of public revenue in 1958, including (besides local taxes) $767,939,000 in federal and $233,366,000 in state revenue. State taxes, which had a weighted average of $2.61 per barrel in 1958, running the range from 62 cents in three states to a high of $16.53 per barrel in one state, continued to exert an influence on local sales. Wisconsin, Nevada, New Jersey, Michigan, and Pennsylvania, each with a relatively low state tax, led in per capita consumption in 1958. Mississippi, North Carolina, Alabama, and Georgia, each with a comparatively high state tax, reported a relatively low per capita consumption.

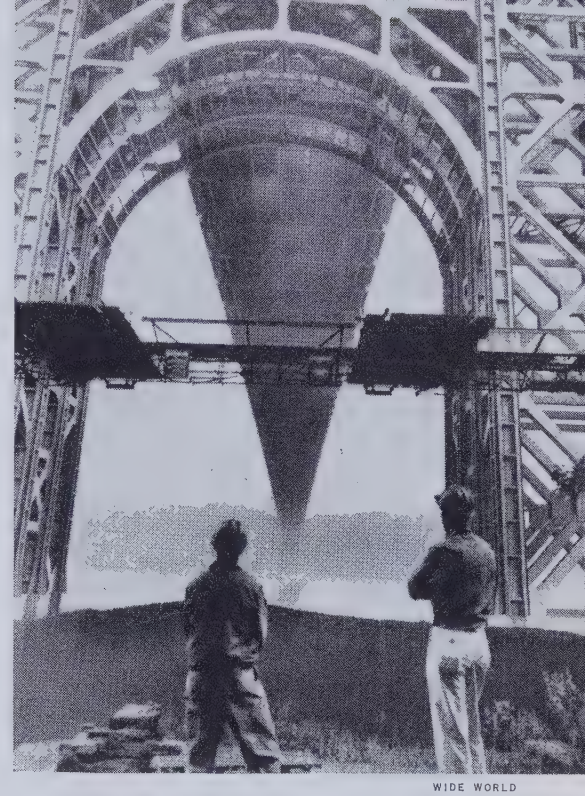
EDWARD V. LAHEY,
Chairman and President,
United States Brewers Foundation.

BRIDGE, Contract. See SPORTS, GAMES, AND SHOWS.

BRIDGES. The Narrows Bridge.—What is now called the Verrazano-Narrows Bridge[1] finally was ready for construction at the end of 1959 as contractors bid on its tower foundations. Preliminary foundation explorations were completed in the deep bedrock on either side of the waterway that this massive structure will cross with its record-breaking 4,260-foot main span. The bridge will connect New York City's boroughs of Brooklyn and Richmond (Staten Island) across the Narrows between upper and lower New York bays. It will form a vital link in a highway system planned to let travelers from Long Island and New England bypass congested Manhattan in traveling south into New Jersey. Its secondary effect will be to open up Staten Island—now connected directly to other New York City boroughs only by ferries—for extensive residential and industrial real estate development. The bridge will carry a six-lane roadway and will have provision for a second such roadway on an upper deck that can be built when needed. The initial cost of the project—complete with extensive approach roads over which local interests argued long and strenuously—is estimated at $350 million. The Port of New York Authority is building the bridge, and the Triborough Bridge and Tunnel Authority will operate it.

George Washington Bridge.—Until the Narrows Bridge is finished, the George Washington Bridge over the Hudson River will remain the greatest in the New York City area. And it is being made even greater now as constructors erect the lower deck for which provisions were made in 1931 when the bridge was built. This $183 million project to increase the traffic-carrying capacity of the bridge beyond its present 40 million vehicles per year includes very extensive modifications of approach roads at its New York and New Jersey ends, in addition to the difficult job of working from platforms hung beneath the present roadway to install the second roadway some 200 feet above the river. Approach modifications at the New York end of the bridge involve cutting a wide slot completely across the north end of Manhattan island to accommodate new roadways and commuter bus facilities.

[1] The question of what to name the bridge engendered considerable controversy and was still unresolved by late 1959. The official brochure at groundbreaking ceremonies on August 14 listed it as the Verrazano-Narrows Bridge, in honor of Giovanni da Verrazano (or Verrazzano), a Florentine navigator who visisted these water in 1524. A Staten Island group, however, continued its efforts to have the bridge named the Staten Island Bridge, and still another group favored, simply, the Narrows Bridge.



WIDE WORLD

Huge work platform is installed for construction of a lower deck on the George Washington Bridge, New York City.

Throgs Neck Bridge.—Also in New York City, where much of United States bridge construction was concentrated in 1959, the steel towers were completed for Throgs Neck Bridge, which will connect Queens and Bronx boroughs, as does the Bronx-Whitestone Bridge about a mile away. In 1960 the cables should be spun for its suspension spans. Extensive approach spans will give the structure a total length of 12,310 feet. It will carry six lanes of traffic and cost some $90 million.

Arthur Kill Bridge.—Another bridge of considerable note in the New York metropolitan area is the Baltimore and Ohio Railroad's lift-span bridge over Arthur Kill, which separates Staten Island from Elizabeth, N.J. The record-breaking 558-foot movable span was floated into position and placed on its towers on May 31. The new facility's movable span exceeds the former record 544-foot Buzzards Bay Bridge over Cape Cod Canal.

New York State Highway Bridges.—Another length record was broken as New York State built two highway crossings with 320-foot spans of prestressed concrete near Syracuse, N.Y. These spans are about twice as long as those of Philadelphia's Walnut Lane Bridge, the first bridge of prestressed concrete to be built in the United States. (Prestressed concrete is put in compression when steel under tension is embedded in it; and concrete beams or slabs under such prestress can carry greater loads.)

New Haven Bridge.—In New Haven, Conn., the nation's second longest steel box-girder span—378 feet 9 inches—was erected over railroad tracks to connect city streets with the Connecticut Turnpike. It will carry eight lanes of traffic. A similar bridge

at New Haven Harbor, opened in 1958, is the only longer box-girder type in the United States.

Hood Canal Bridge.—Concrete pontoons, on which a bridge is to float across Hood Canal (an arm of Puget Sound) in the State of Washington, gave their constructors trouble by sinking while under construction on Dec. 27, 1958. The $17.5 million bridge project was delayed through 1959 as a $750,000 salvage job had to be done on the two big pontoons, which are 50 feet wide, 360 feet long, and 14 feet deep. In all, 23 of them will be built, towed to the site, and put in place to carry a 6,470-foot crossing of the waterway.

Fort Pitt Bridge.—In Pittsburgh, the city of bridges, a novel two-level arch bridge was opened to traffic in 1959. The 750-foot structure is notable for having relatively slim girders for its arch and a relatively deep truss, carrying the roadways, as a tie for that arch. This $16 million structure spans the Monongahela River to replace an old structure at Pittsburgh's redeveloped Point Park, where the Monongahela and Allegheny rivers join to form the Ohio. A similar but shorter bridge was started to accomplish the same sort of replacement for a new crossing of the Allegheny River at the other side of the Point Park.

Corpus Christi Bridge.—An arched cantilever span of considerable significance for its traffic relief was finished in 1959 in Corpus Christi, Texas, at a cost of about $9 million. It spans the entrance to the city's port at a high level and replaces a low-level bascule bridge which was a bottleneck. Total length of the bridge is 5,862 feet; it is to carry six lanes of traffic.

Iowa-Illinois Memorial Bridge.—A new Mississippi River suspension bridge, built alongside a similar 24-year-old crossing, was virtually completed in 1959. The 5,017-foot structure has a 1,480-foot main span. The two-lane bridge is the 39th highway crossing of the Mississippi between St. Paul, Minn., and New Orleans at the Gulf of Mexico.

Louisville–New Albany Bridge.—This Kentucky-Indiana crossing of the Ohio River is a two-arch bridge started in 1958 and due for completion in 1961. The $11 million structure will have two identical 800-foot tied arches and will carry two decks of traffic, three lanes on each.

Frankland Bridge.—Connecting the twin cities of Florida's west coast, Tampa and St. Petersburg, the Frankland Bridge across Old Tampa Bay was ready to open early in 1960. The four-lane crossing extends over 6.6 miles of the bay, including about 3.6 miles of causeway, and cost $16 million.

Biscayne Bay Bridge.—The 36th Street Causeway, under construction in 1959 to connect Miami, Fla., with Miami Beach, is a $10 million six-lane structure, 3.2 miles long, crossing Biscayne Bay. It includes two shipping-lane bridges totaling 3,288 feet in length.

Carquinez Strait Bridge.—Carquinez Strait, the arm of California's San Francisco Bay over which a major new crossing was completed late in 1958, is now to have still another connection, from Benicia to Martinez. This 6,215-foot, steel-truss structure was started in 1959 and is scheduled for completion in 1962.

Aluminum Bridges.—Structural aluminum, which was used in Des Moines, Iowa, in 1958, in its first major application in a highway bridge, had another such use in 1959 when a minor highway overpass was erected of aluminum girders on the Long Island Expressway in New York. The use of sheet aluminum in fabricated forms as girders for highway bridges was delayed in 1959 as laboratory tests continued. Plans to build the first such bridge on a highway in Alabama were changed when tests equivalent to 35 to 40 years' use did not satisfy the aluminum company which is developing this particular sheet-aluminum bridge. However, at the end of 1959, New York State was planning a bridge of this type, also for Long Island.

Canada.—In 1959, Canada was involved in reconstruction at two major bridges where structural collapses had occurred. At the Second Narrows Bridge in Vancouver, B.C., concrete piers were replaced after being pushed out of line by two spans that dropped during construction when a foundation for temporary falsework gave way in 1958. The cantilever-type steel bridge will have a 1,100-foot main span and will cost $20 million (instead of the $16 million estimated before the accident) when finally completed. On Peace River, also in British Columbia, a $6 million truss bridge was under construction to replace the suspension bridge that slipped an anchorage and collapsed in 1957.

At Sault Ste. Marie a new international bridge to the United States is to be built by 1961 at a cost of about $18 million. Some 12,000 feet of bridge and approaches are planned to span the St. Mary's River and the busy locks connecting Lake Huron and Lake Superior. It is a Michigan-Ontario venture.

Canal Zone.—A new high-level steel arch crossing of the Panama Canal was under construction in 1959. The $23 million bridge at Balboa will clear the canal by 201 feet, and its arch will span 1,120 feet.

Venezuela.—The 5½-mile crossing of the mouth of Lake Maracaibo in Venezuela was still under construction in 1959. A specially designed work tower that will stand in the lake and carry erection cranes was prepared to help build the $99 million structure's unusual prestressed concrete main spans.

France.—The 2,000-foot main span (longest in Europe) of the suspension bridge at Tancarville (near Le Havre) was opened to traffic on July 3, 1959.

Germany.—Crossing the Rhine at Cologne, the St. Severinus Bridge was dedicated in November 1959. So as not to conflict with the twin spires of Cologne Cathedral, the bridge was designed with only one tower, and is said to be the longest single-tower suspension bridge in the world. Its 996-foot center span is supported by a 255-foot pylon near the right bank of the river, resulting in an asymmetrical design.

Scotland.—Foundations for what will be Europe's longest bridge span, the 3,300-foot main span of the new Firth of Forth Bridge in Scotland, were under construction in 1959. The bridge, which will parallel the famous old Firth of Forth Bridge, will cost over $46 million.

Turkey.—Work continued on bridging the Bosporus at Istanbul with a suspension bridge which has a 2,215-foot main span.

India.—A $33.6 million road-and-rail bridge over the Ganges at Mokameh, Bihar, was opened in April 1959. Its 14 main spans, each 397 feet long, rest on piers which were sunk 200 feet deep, and its overall length is 6,074 feet. An upper roadway for vehicles has pedestrian sidewalks, also, and a lower roadway carries a broad-gauge rail track.

Pakistan.—A steel-arch bridge with span of 806 feet 9 inches is planned to cross the Indus River near Sukkur, to carry rail traffic.

Italy.—Financing is sought for the long-dreamed-of Strait of Messina Bridge to connect Sicily and Italy. This would be a double-decked suspension bridge that could cost over $200 million.

Senior Staff Editor, "Engineering News-Record."

BRITISH BORNEO. See BORNEO.

BRITISH CAMEROONS (Cameroons under British Administration). A narrow strip of territory in west-central Africa bordered by Nigeria, French Cameroons, and the Gulf of Guinea, this trust territory of the United Nations was administered in 1959 by Britain as an integral part of the Federation of Nigeria (see BRITISH WEST AFRICA). Area, 34,081 square miles; population (mid-1958 est.), 1,591,000, comprising a diversity of African tribes. Main towns are Buea, the capital of Southern Cameroons, and the seaports of Bota and Victoria.

Government.—Southern Cameroons (area, 16,581 sq. mi.) is administered by the federal government of Nigeria; Northern Cameroons (17,500 sq. mi.) comprises parts of Adamawa, Borno, and Benue provinces of the Northern Region of Nigeria. The electorate of Northern Cameroons voted in a plebiscite on Nov. 7, 1959, to continue the British trusteeship for the territory (see below, *Principal Events*). As a result of the electorate's decision not to federate with Nigeria, the territory's government and ad-

ministration are to be separated from those of Nigeria's Northern Region.

The governor general of Nigeria (Sir James Robertson, who assumed office in 1958) acts as high commissioner for Southern Cameroons. The office of prime minister and a ministerial system were introduced in 1958. Parliament consists of a 20-member House of Chiefs and a 32-member House of Assembly. In elections to the assembly on Jan. 24, 1959, which were the first to be based on universal adult suffrage, the National Democratic Party, which favors union with French Cameroons, won 14 of the 26 contested seats.

Finance.—No separate budget is prepared for Northern Cameroons. The budget for Southern Cameroons for 1958–59 estimated revenues at £1,066,580 (including grants from Nigeria and Britain), and expenditures at £1,278,965.

Education.—In 1957, British Cameroons had 459 schools, including 444 primary, 3 secondary, 8 teacher-training, and 4 trade schools. Total enrollment in all schools was 52,206 pupils, most of whom were in Southern Cameroons.

Transportation.—There are 1,084 miles of motor roads (in 1956); road development is financed by both the territory and the Nigerian federal government. There are airfields at Tiko (all season) and Mamfe (dry season).

Economy.—Agriculture is the principal industry. Chief crops for export are bananas, cocoa, rubber, and palm kernels; subsistence crops include coco yams, plaintains, beans, casaba, corn, and rice. Other industries are food processing, tanning hides and skins, and making palm oil and sheet rubber. Total exports from Southern Cameroons in 1957 were valued at £5,351,053; imports, at £2,370,380. Principal exports and 1957 values are bananas, £2,799,000; cocoa, £996,000; rubber, £313,000; and palm kernels, £62,000. Imports include textiles, iron and steel products, machinery, vehicles, fertilizers, and cement.

Principal Events, 1959.—In compliance with a resolution of March 13 by the U.N. General Assembly to hold a plebiscite as a first step toward the territory's independence, the largely illiterate electorate of Northern Cameroons exercised the secret ballot for the first time on November 7. Of 113,198 votes cast, 70,401 favored continuing the trusteeship for the time being and 42,797 were for integration of the territory with Nigeria. The plebiscite was supervised by a team of United Nations officials headed by the Iranian delegate, Dr. Djalai Abdoh. The majority vote for continuation of the trusteeship was surprising in view of the fact that a United Nations mission had reported in January that popular sentiment in Northern Cameroons was overwhelmingly in favor of federation with Nigeria.

As the result of another resolution approved by the U.N. General Assembly on October 16, a plebiscite is to be held in Southern Cameroons between September 1960 and March 1961 to determine whether the territory will attain independence by federating with Nigeria or with French Cameroons.

W. R. F.

BRITISH COLUMBIA. The third largest and most westerly of the Canadian provinces, British Columbia has an area of 366,255 square miles. Forming a part of the province are the Queen Charlotte Islands (3,866 square miles) and Vancouver Island (12,408 square miles). The population was estimated at 1,570,000 as of June 1, 1959 (1956 census, 1,398,464). A large part of the population is concentrated in and around the southern coastal areas of metropolitan Vancouver (1956 census, 665,017) and metropolitan Victoria, the capital (125,447). Other chief urban centers and their 1956 census populations include: Nanaimo, 12,705; Penticton, 11,894; Trail, 11,395; and Prince George, 10,563.

Government.—British Columbia is represented in the Canadian Parliament by 6 senators (appointed for life) and 22 members of the House of Commons. The provincial government is administered by a lieutenant-governor (Frank Mackenzie Ross) and a Legislative Assembly of 52 members. The Social Credit Government headed by Premier W. A. C. Bennett was re-elected in the general election held on Sept. 19, 1956. At the end of 1959, party standings in the Legislative Assembly were: Social Credit, 38; Cooperative Commonwealth Federation, 10; Liberal, 3; and Labour, 1.

Education.—Education is compulsory for children between the ages of 7 and 15. During the school year 1957–58, there were 277,070 pupils enrolled in 1,145 public schools and instructed by 10,171 teachers. In addition, there are a number of private institutions modeled on the English public school system. Higher education is offered by the University of British Columbia at Vancouver, which in 1957–58 had an enrollment of 9,433 full-time undergraduates; and by its affiliated college located in Victoria, with an enrollment of 835. A College of Education on the university campus at Vancouver provides additional teacher training.

Finance.—Estimated current revenue for 1959–60 was $287,775,423; estimated current expenditure, $300,401,394. Capital expenditure out of income included in the expenditure figure was $69,493,000 (including $12,250,000 for debt reduction).

Transportation and Communications.—The province is crossed from east to west by two transcontinental railways, the Canadian Pacific Railway and the Canadian National Railway. The Pacific Great Eastern, a provincially owned railway, operates a line running north and south from Vancouver to Fort St. John and Dawson Creek. Railroad mileage as of Dec. 31, 1958, was 6,147, including 4,749 miles of main-line track. As of March 31, 1958, there were, exclusive of urban streets, 23,165 miles of highway in the province. Trans-Canada Air Lines and the Canadian Pacific Airlines operate international air routes. Shipping lines reach out from British Columbia to the major ports of the world.

Industries.—British Columbia's four major industries yielded the following returns in 1958: forestry, $542,787,427; mining, $146,840,000; agriculture, $119,238,000; and fisheries, $98,224,000. The value of manufacturing was $1,785,298,750. The fishing catch, consisting chiefly of salmon, herring, and halibut, totaled 490,187,000 pounds in 1957. The forest industry yielded 4.99 billion feet of sawn lumber in 1958. As of June 30, 1959, housing units under construction numbered 11,156; building permits issued in 1958 were valued at $264,214,000. Crude petroleum production increased 50% in 1958 to 512,359 barrels, from 340,945 in 1957. Electric power generated in 1958 was 11,682,152,000 kw.-hr. As of January 1959, total hydro and thermal electric capacity of utility and industrial power plants was 2,728,390 kilowatts.

Trade.—Retail sales in British Columbia were valued at $1,615,997,000 in 1958. Exports through provincial customs ports in 1958 totaled $811,162,000; imports, $420,078,000.

Principal Events, 1959.—The visit of Queen Elizabeth II and Prince Philip to British Columbia in mid-July was the first by a reigning monarch since 1939. (See also VANCOUVER.) On July 15, the queen officially opened the Deas Island Tunnel, which crosses the south arm of the Fraser River and is a basic link in the new freeway leading from Vancouver to the United States border at Blaine. The 4,400-foot tunnel, the first of its kind in North America, consists of a series of prefabricated concrete shells lowered into a trench dredged in the bottom of the river.

The provincial government is building mainland docking facilities and two fast car ferries for service beginning in 1960 between the Vancouver area and Victoria. The Wenner-Gren B.C. Development Company completed its summary of the potential water power in the Rocky Mountain Trench district and found the Peace River to have a potential of 4 million horsepower at a site near Hudson Hope. The company proposes to start construction in 1960 on a $600 million power development project that in its first stage will cost $375 million and produce 805,000 kilowatts by 1966.

Celgar Ltd. is building a $50 million pulp mill near Castlegar in the Arrow Lakes area which will have a capacity of 500 tons annually and will be in production by early 1961. The first iron and steel

smelter in western Canada is being built at Kimberley by the Consolidated Mining and Smelting Co., Ltd.; electric furnaces will be used and planned production of pig iron and steel ingots is 100,000 tons per year.

Director, Bureau of Economics and Statistics.

BRITISH COMMONWEALTH. See COMMONWEALTH OF NATIONS.

BRITISH EAST AFRICA. Situated in east-central Africa and bordering on the Indian Ocean, British East Africa consists of three mainland territories and two islands comprising (1) the crown colony and protectorate of Kenya, (2) the territory of Tanganyika (a United Nations trusteeship), (3) the protectorate of Uganda, and (4) the protectorate of Zanzibar, which includes the islands of Zanzibar and Pemba. Total area, 681,761 square miles; population (1958 est.), 21,333,111.

BRITISH EAST AFRICA

Territory	Area (sq. mi.)	Population	Capital
Kenya Colony and Protectorate	224,960[1]	6,351,000[2]	Nairobi (233,800)[2]
Tanganyika Territory	361,800[3]	8,916,000[2]	Dar es Salaam (128,742)[4]
Uganda Protectorate	93,981[5]	5,767,000[2]	Entebbe (11,039)[5]
Zanzibar Protectorate	1,020[7]	299,111[8]	Zanzibar (57,923)[8]
Total	681,761	21,333,111	

[1] Land area, 219,780 sq. mi. [2] Est. mid-1958. [3] Land area, 341,150 sq. mi. [4] 1957 census. [5] Land area, 80,292 sq. mi. [6] 1958. [7] Zanzibar, 640 sq. mi.; Pemba, 380 sq. mi. [8] 1958 census.

The East African High Commission (administrator, E. B. David), consisting of the governors of Kenya, Tanganyika, and Uganda, is assisted by a 34-member Central Legislative Assembly in providing common services such as railways, customs, posts and telegraphs, civil aviation, and naval defense (the Royal East African Navy). Other defense is provided by the East African Land Forces Organization based at Nairobi, Kenya.

Principal organs of the High Commission are the East African Railways and Harbors Administration (railways aggregate 3,375 miles) and the East African Posts and Telecommunications Administration. Other services include numerous scientific, medical, industrial, and agricultural research organizations.

Revenue of the High Commission in 1957–58 was £4,959,534, of which £3,514,331 was contributed by the three mainland territories and Zanzibar. The common currency is regulated by the East African Currency Board; the East African shilling equals U.S.$0.14. Virtually free trade exists between the East African territories. Exclusive of Zanzibar, exports in 1958 were valued at £116 million; imports, at £121 million.

Tom Mboya (extreme left), a leader in Kenya's drive for independence, is welcomed by followers at Nairobi airport on his return in May from a tour of the United States.

WIDE WORLD

KENYA

Kenya Colony and Protectorate is situated on Africa's eastern coast between the Indian Ocean and Victoria and Rudolf lakes. Area, 224,960 square miles, including 5,230 square miles of lake area. The population of 6,351,000 (mid-1958 est.) includes 6,080,000 Africans, 84,500 Asians, 35,500 Arabs, and 22,000 Europeans. The protectorate consists of the mainland dominions of the sultan of Zanzibar, who is paid a yearly rent of £10,000. Principal cities are Nairobi, the capital (1957 est., 221,700) and Mombasa, chief port in East Africa.

Government and Political Events, 1959.—On October 23, Sir Patrick Muir Renison was sworn in as governor of Kenya (succeeding Sir Evelyn Baring, who retired). The governor is assisted by a Council of Ministers and a Legislative Council, which consists of 36 directly elected members (14 Africans, 14 Europeans, 6 Asians, and 2 Arabs) and 12 special members (4 Africans, 4 Asians, and 4 Europeans) chosen by the elected members. In addition, a Council of State, composed of 10 members nominated by the governor, is an independent body charged with the sole duty of protecting Kenya's racial communities against discriminatory legislation.

The non-European members of the Legislative Council ended their 5-month boycott of the council on April 29 after Colonial Secretary Alan Lennox-Boyd announced that the government would convene a conference to revise Kenya's constitution in preparation for self-government. Three new political organizations were formed during the year. On April 2, Michael Bludell, minister of agriculture, resigned from the cabinet in order to head a new party called the New Kenya Group, consisting of moderates advocating a multiracial policy designed to further self-government for Kenya. The formation of the Kenya National Party, announced on July 24, was backed by eight of the 14 elected African members of the Legislative Council who favor common voters' rolls, integrated schools, and equality of economic opportunity. Similar to this party but more extreme in its demands is the Kenya Independence Movement, founded in August by Tom Mboya, general secretary of the Kenya Federation of Labor. The three parties have the same goal—self-government—but they differ widely as to the best means for achieving that goal.

Of the 80,000 persons detained as a result of the Mau Mau rebellion which began in 1952, fewer than 1,000 remained under detention by mid-1959. The alleged leader of the rebellion, Jomo Kenyatta, was released on April 15 and deported with four other released Mau Mau convicts to Lodwar in the Northern Province. One of the prosecution's witnesses at Kenyatta's trial was found guilty on April 5 of swearing falsely that he had lied at the prosecution's behest during that trial. Following a coroner's ruling on May 6 that 11 Mau Mau convicts had died as the result of beatings administered by African guards at the Hola detention camp, the government suspended from duty the camp commandant and his deputy.

A proposal to open the White Highlands to nonwhite settlers met with opposition from the white farmers in that restricted area, but it was expected that the proposal would become law.

Finance.—For the fiscal year ending June 30, 1959, expenditure was estimated at £40,320,157; revenue, at £40,058,921. Revised estimates for the fiscal year 1958 showed a deficit of £1,179,588. Expenditure under the 3-year development plan begun in 1957 was estimated at £8.8 million for fiscal 1959.

Education.—In 1958, facilities for African education included 3,879 primary schools (8 government, 3,107 government-aided, 764 unaided) with 530,335 pupils; 28 secondary schools (10 government, 12 government-aided, 6 unaided) with 3,928 pupils; and 42 teacher-training centers (6 government, 33 government-aided, 3 unaided) with 3,545 students. European education consisted of 46 primary schools (18 government, 16 government-aided, 12 unaided) with 8,497 pupils, and 14 secondary schools (5 government, 1 government-aided, 8 unaided) with 2,949 students. For

Asians and Arabs, there were 129 primary schools with 41,841 pupils, and 36 secondary schools with 7,314 students. Five government technical and trade schools for Africans had 1,114 students in 1958. The Royal Technical College of East Africa at Nairobi had 270 students.

Production.—Kenya's diversified economy places productive emphasis on agriculture, mining, and forestry. Principal cash crops are coffee and tea; minor crops include cotton, sisal, wheat, sugar, and pyrethrum, which are grown mainly in the highlands and Nyanza province. In 1958, production of coffee for export was 49.2 million pounds (up 12% over 1957); tea, 18.2 million (up 13%); and cotton, 4.9 million (an increase of 58% over the poor crop year of 1957). Output of wheat in 1958 was estimated at 100,000 tons; barley, 16,100; and sugar, 27,900 (up 34% over 1957). The forestry industry produces sawn timber (232,000 cubic feet in 1958) and wattle bark (2,950 tons) for export. Livestock is important; Kenya exported 4,134 tons of hides and skins in 1957. Minerals include gold (10,300 troy ounces exported in 1958), copper, cement, soda ash, and salt.

Foreign Trade.—Total exports in 1958 were valued at £33.2 million; imports, at £60.8 million. Coffee accounts for about one third of total export value, followed by tea, sisal, wattle bark, pyrethrum, and hides and skins. Principal imports are manufactures (valued at £16.3 million in 1958), machinery (£14.6 million), mineral fuels (£8.3 million), textile yarn (£6.9 million), chemicals (£4.4 million), and food (£4.0 million). Kenya's chief trading partners are the United Kingdom and other Commonwealth nations, West Germany, and the United States.

Transportation and Communications.—Kenya's public highway system totals 24,500 miles, of which 453 miles are bitumen-surfaced, 3,710 miles comprise other all-weather roads, and 5,114 miles are secondary roads. Railways aggregate 1,336 miles, including 871 miles of main lines. Air services within the colony and to the other East African territories are provided by the East African Airways Corporation. The new Nairobi Airport was opened in 1958. There is a radio station at Nairobi. In 1958, Kenya had 34,410 telephones.

Tanganyika

Administered since 1921 by Great Britain (as a United Nations trusteeship after 1946; before that, as a League of Nations mandate) and formerly a German colony, Tanganyika has a coastline of about 450 miles on the Indian Ocean and extends inland to Victoria and Tanganyika lakes. Area, 361,800 square miles, including 20,650 square miles of lake regions. At the 1957 census the population was 8,788,466 (mid-1958 est., 8,916,000), composed of some 120 tribes predominantly of Bantu origin who constitute the great majority, together with 71,660 Indians and Pakistani, 20,598 Europeans, and 19,088 Arabs. The territory is divided into 10 provinces, each having a capital city. The territorial capital and principal port is Dar es Salaam (1957 pop., 128,742).

Government and Political Events, 1959.—The governor (Sir Richard Turnbull assumed office in 1958) is assisted by a Council of Ministers, consisting (from July 1, 1959) of 5 elected members (3 Africans, 1 Asian, and 1 European) and 7 nominated officials, and an Executive Council, composed of the Council of Ministers and a number (5 in 1959) of nominated nonofficial members. The Legislative Council comprises a speaker, 34 government members, and 33 representative members, including 30 who are elected on the basis of 1 African, 1 European, and 1 Asian member for each of ten constituencies. The first elections to the Legislative Council occurred in five constituencies in September 1958 and in the remaining five in February 1959. The results were an overwhelming victory for the Tanganyika African National Union, which had supported 28 of the 30 winning candidates. This multiracial party advocates independence for Tanganyika through moderate and nonviolent means. Its leader, Julius Nyerere, visited London in June and presented proposals for increased self-government for Tanganyika to British colonial officials. On December 15 the governor announced that Tanganyika will receive internal self-government in 1960.

Finance.—In 1959–60, expenditure (including development) was estimated at £25,348,457; revenue, at £24,013,629. For the ten years ending in June 1958, expenditure for the development of natural resources totaled £17,957,000.

Education.—The government maintains separate schools for Africans, Asians, and Europeans, and also subsidizes separate schools administered by local authorities and voluntary agencies. Government expenditure for education in 1958–59 totaled £3,906,910, including £2,427,513 for African education. Facilities for African pupils in 1958 included 2,660 primary schools (366,690 pupils); 293 middle, 21 district, and 1 presecondary schools (aggregating 36,611 pupils); 28 secondary schools (3,499 pupils), and 31 teacher-training centers (1,784 students). For European education there were 8 government primary schools (1,224 pupils) and 24 private schools. Asian education consisted of 146 grant-aided schools (16,921 pupils) and 8 government schools (6,120 pupils). A report by the Working Party on Higher Education in East Africa has recommended that a University College of Tanganyika be established at Morogoro by 1965–66.

Production and Trade.—Tanganyika is the world's leading producer of sisal; exports in 1958 totaled 198,130 tons. Other crops produced primarily for export are coffee (22,225 tons exported in 1958), cotton (32,062 tons), and tea (2,339 tons). Secondary agricultural production includes sugar (21,000 tons produced in 1958), wattle bark (866 tons exported in 1958), wood and timber (535,000 cubic feet exported), beans, pulses, and other subsistence crops. Hides and skins exported in 1958 totaled 4,839 tons. Principal minerals are diamonds (515,000 metric carats exported in 1958), gold (56,299 fine troy ounces), lead, and mica. Total exports in 1958 were valued at £41,707,000 (up £2,276,000 over 1957); imports, £28,630,000 (down about £6 million). Sisal accounts for about one fourth of total export value; imports include cement, cotton piece goods, iron and steel, and manufactures. The territory's chief trading partner is the United Kingdom.

Transportation and Communications.—Tanganyika's highway system in 1958 aggregated 20,000 miles, including 3,600 miles of territorial main highways and 4,500 miles of local main roads. Tanganyika Central and Northern Railways operate 1,300 miles of main lines and over 300 miles of principal branch lines. Some 50 airports and landing strips maintain internal, interterritorial, and international air services. British Overseas Airways operates regular flights between Dar es Salaam and London. Telephones numbered 12,507 in 1957.

Uganda

This British protectorate, established in 1894, is situated in the interior of eastern Africa and is bounded by Kenya on the east, Tanganyika on the south, the Belgian Congo on the west, and the Sudan on the north. Its total area of 93,981 square miles includes parts of Lake Victoria and other lakes, aggregating 13,689 square miles. The population (est. mid-1958) of 5,767,000 includes 5,695,000 Africans. Uganda is divided into four administrative provinces: Buganda (the principal native kingdom), Eastern, Western, and Northern. The seat of government is Entebbe; the commercial center is Kampala.

Government and Political Events, 1959.—Uganda is administered by a governor (Sir Frederick Crawford, appointed in 1956), who is assisted by a 12-member Executive Council, of whom 7 members are officials and 5 (including 3 Africans) are selected from the public. The 62-member Legislative Council consists of 30 representative members (18 Africans, 6 Asians, and 6 Europeans) and 32 government members (including 16 Africans). The Buganda parliament, which has not permitted the kingdom's 5 representatives to participate in the Uganda Legislative Council, requested early in the year that the Buganda agreement be terminated and the British protection over Uganda be ended. The request was denied, but the governor set up a constitutional committee to consider the next steps to be taken toward self-government. However, the Buganda parliament refused to nominate representatives to the committee. In May the government banned a newly formed organization called the Uganda National Movement on account of its support for an African boycott of non-African stores that had led to clashes between demonstrators and police in Kampala. On July 7, the governor ordered six alleged leaders of the boycott movement deported to remote areas of Uganda.

Finance.—Government expenditure for the fiscal year 1958–59 was £20,383,241; revenue, £19,871,598. Expenditure for the 1959–60 budget is estimated at £20,503,303; revenue, £19,836,567. Allocations for development expenditure in the 3-year period 1958–61 include education (£973,000), railway extension (£860,000), African housing (£850,000), agriculture (£525,000), and local government (£635,000).

Education.—Most African schools are managed by religious voluntary agencies; Asian schools are administered by both the government and local communities. At the end of 1958 there were 2,118 grant-aided primary schools (with 317,899 pupils), 3,051 unaided primary schools (134,576 pupils), 173 grant-aided secondary schools (17,454 pupils), and 77 unaided secondary schools (6,855 pupils). Asian pupils totaled 15,195 in primary, and 4,897 in secondary schools. There were 37 teacher-training colleges and 81 rural trade schools. The University College of East Africa at Makerere enrolled 823 students, including 270 from Uganda.

Production.—Main cash crops are cotton, which is grown exclusively by African peasants, and coffee, which is cultivated mainly by Africans but is also grown on large non-African estates. The bumper cotton crop in the 1957–58 season totaled 400,100 bales (400 pounds each); coffee output was 77,000 tons, down slightly from the record yield of the previous year. Tea production was the highest on record, about 8,300,000 pounds. Other major crops are tobacco (3,750,000 pounds in 1957–58) and sugar (80,000 tons). Important exports are hides (2,126 tons in 1957–58), goat skins (1,011,300 pieces), and sheep skins (107,500 pieces). Production of copper, the most valuable mineral, was valued at £2,065,335; of lesser commercial importance are wolfram, tin, gold, and lead. Cement production was 102,000 tons. Lakes and river fisheries employ about 20,000 persons (mostly Africans); catches in 1958 totaled 52,000 tons, valued at £2,120,000. Output of electricity in 1958 was 177 million kw.-hr.

Foreign Trade.—Uganda's exports in 1958 were valued at £45,409,024; imports at £27,002,482. Coffee, which had an export value of £20,827,270, became for the first time the chief export item, surpassing cotton, which was valued at £18,141,400. Other exports and their 1958 values (in thousand pounds) were: copper, £2,065; animal feeds, £1,104; tea, £979; and hides and skins, £647. Principal imports include synthetic fibers and cotton piece goods, clothing, iron and steel, motor vehicles, machinery, petroleum products, and tires and tubes. About one half of Uganda's trade is with other Commonwealth countries.

Transportation and Communications.—Lake, marine, road, and railway services in Uganda are operated by the East African Railways and Harbors Administration. In 1959 the Uganda Legislative Council approved the administration's proposal to build a new railway from Jinja to Bukontes on the Kampala-Nairobi line, thereby reducing total mileage of the trip by 45 miles and saving four hours of traveling time. Uganda has 2,898 miles of all-weather highways and 503 miles of bitumenized roads, as well as 8,300 miles of local roads. The airport at Entebbe is served by four international airlines. In 1958 there were 38,844 registered motor vehicles, and 12,069 telephones.

Zanzibar

A British protectorate since 1890, Zanzibar is the largest coralline island (area, 640 square miles) on the East African coast, and is separated from the mainland by a channel 22½ miles across. The island of Pemba (380 square miles) lies 25 miles to the northeast. The total population of 299,111 (1958 census) comprises 228,815 Africans, 46,989 Arabs, 18,334 Asians, 507 Europeans, and 4,466 of other races.

Government and Political Events, 1959.—The British resident (Sir George Mooring was appointed in 1959 to succeed Sir Henry Potter in early 1960; Sir Henry took office in 1954) presides over a 12-member Executive Council (including 7 official members) and a 25-member Legislative Council (including 13 official and 12 representative members). On April 16, 1959, the British resident announced a change in the number of representative members of the Executive Council from 3 to 5, of whom 2 are representatives of the Legislative Council and one represents Pemba; and an increase in the number of elected representative members of the Legislative Council from 6 to 8, with the number of appointed representative members accordingly decreased from 6 to 4. The first elections of representative members (then 6 in number) to the Legislative Council took place in 1957. It was also announced in 1959 that the minimum age of the male electors was reduced from 25 to 21 years, and that a committee would be appointed to consider giving women the right to vote. A Privy Council, consisting of the heir apparent to the throne, 2 ex-officio members, and the British resident as vice president, is presided over by the sultan (Seyyid Sir Kalifa bin Harub, acceded in 1911). The legislative decrees of the sultan are binding when countersigned by the British resident.

Finance.—Government revenue in 1958 was estimated at £2,626,763; expenditure, £3,183,472. In 1957–58, Zanzibar contributed £37,514 to services of the East Africa High Commission.

Education.—Primary school education is free for Arabs, Africans, and Indians. In 1958 there were 18,900 pupils enrolled in 78 government and grant-aided public schools; there are in addition 3 independent schools and 2 teacher-training centers. Higher education for Arab and African students is provided at Makerere College, Uganda.

Production.—The protectorate has the world's largest growth of clove trees—about 61,000 acres containing some 4 million trees (of which about three fourths are on Pemba)—and provides about 80% of the world's clove supply. Clove exports in 1958 totaled 9,104 metric tons, and exports of clove oil amounted to 92 tons. Next in economic importance is the growing and processing of coconuts; exports of coconut oil totaled 3,330 tons in 1958, and copra production was 13,272 tons in 1958. Other crops are rice, cassava, sweet potatoes, chilies, tobacco, and maize; tropical fruits are grown, and a small export trade in oranges is conducted with the mainland. Manufactures include coir fiber and rope, soap, jewelry, ivory and ebony ornaments, and metalware.

Foreign Trade.—Zanzibar's exports in 1958 totaled £5,060,000; imports, £5,200,000. Well over half of the annual export value is furnished by cloves and clove oil. Principal imports are cotton piece goods (2,170,000 square yards in 1958), rice (8,280 tons) and grain, petroleum, ivory, tobacco, and foodstuffs. About 60% of total exports go to the United Kingdom and Commonwealth countries.

Transportation.—Roads on the island of Zanzibar aggregate 339 miles (63 miles bitumen-surfaced); and on Pemba, 107 miles (26 miles bitumen-surfaced). There are no railways. Zanzibar is a port of call for many foreign steamship companies, and the government operates regular service to Pemba and the African mainland.

W. R. F.

BRITISH GUIANA. This crown colony (the only British territory on the South American continent) is situated on the Atlantic Ocean, and is bounded by Brazil on the south and west, by Venezuela on the west, and by Surinam on the east. Its area of 83,000 square miles comprises three counties (named from the principal rivers): Essequibo, 61,660 square miles; Berbice, 16,920; and Demerara, 4,420. The population at the end of 1958 was estimated at 540,620, including 258,610 of East Indian descent and 182,710 of African origin. Principal towns are Georgetown, the capital (pop., with environs, 126,550 in 1958), New Amsterdam, Mackenzie, Springlands, and Bartica.

Government.—An interim government comprises the governor (Sir Ralph Grey, appointed Oct. 7, 1959, succeeding Sir Patrick M. Renison); a 9-member Executive Council, over which he presides; and a 23-member Legislative Council, in which 14 seats are elective. Of these 14 seats, 9 were won in the 1957 elections by the left wing of the People's Progressive Party, led by Dr. Cheddi B. Jagan (former prime minister who was deposed in 1953 following charges that his party had engaged in Communist intrigues); 3 by the moderate wing, led by Linden F. Burnham; and 1 each by the United Democratic Party and the National Labor Front.

Finance.—The British West Indian dollar equals U.S.$0.5833. Budget estimates for 1959 provided for current expenditure of BWI$47,456,899, and for revenue of BWI$49,221,690. A sum of BWI$21,450,000 was allocated in 1959 to the 5-year development program, costing BWI$91 million, to improve and extend basic facilities. Technical assistance is being provided by the U.S. International Cooperation Administration.

Education.—In 1958 there were 111,746 pupils in the colony's 316 public primary schools. The 41 secondary schools comprised 2 government-owned, 9 grant-aided, and 30 private secondary schools. There are 3 vocational secondary schools, and a trade school is conducted at Mackenzie.

Transportation.—Motor roads aggregate 370 miles; forest roads, 239 miles; and trails, about 400 miles. The government-owned British Guiana Airways provides services within the colony; external services are operated by British West Indian Airways, Pan American World Airways, KLM Royal Dutch Airlines, Air France, and Cruzeiro do Sul. Motor vehicles numbered 16,238 in 1958. Railway mileage in 1959 comprised 94 miles of government-owned railways and 63½ miles owned by the Demerara Bauxite Company. Work continued in 1959 on a multimillion dollar railroad to connect manganese mines on the Barima River with tidewater.

Economy.—Agriculture and mining form the basis of the economy. Bauxite production (accounting for about 90% of mining revenue) was 1,585,879 tons in 1958. Also mined are gold (17,500 bullion ounces in 1958), and diamonds (33,091 metric carats). Sugar production rose in 1958 to a record 306,361 tons. Other leading crops include rice (the major subsistence crop), coconuts, coffee, cocoa, and citrus fruits. About 60,000 square miles of forest area are available for exploitation; 1,404,000 cubic feet of sawn timber were exported in 1958.

Foreign Trade.—Total exports in 1958 were valued at BWI$97,708,582, including sugar, 300,320 tons (BWI$54,727,482); bauxite (BWI$20,562,188); rice (BWI$4,785,346); timber (BWI$3,458,256); and rum, 2,454,872 gallons (BWI$3,453,849). Total imports were valued at BWI$116,408,248, including machinery (BWI$28,544,527); flour (BWI$4,262,753); and cotton piece goods (BWI$3,045,937). The United Kingdom took 48% of British Guiana's exports in 1958; Canada, 32%; and the United States, 6%. Of total 1958 imports, the United Kingdom supplied 46%; Canada, 7%; and the United States, 16%.

Principal Events, 1959.—The colony's future economic development was discussed at London in August by British colonial officials and a delegation from British Guiana headed by Dr. Cheddi B. Jagan, minister of trade. A development program was advanced that would cost initially BWI$110 million, of which new United Kingdom development and welfare allocations would provide BWI$22 million. In addition the United Kingdom would make two loans of BWI$19.2 million each to the colony during the period 1960–64. Priority was to be given drainage and irrigation works, and plans

for a new hospital at Georgetown and reconstruction of the 67-mile main coastal road were to be completed but their execution deferred. The development program was characterized as inadequate by Dr. Jagan.

The Legislative Council, sitting as a special committee "to recommend what form constitutional advance from the present interim arrangements should take," recommended on May 11 that British Guiana should become an independent state within the Commonwealth. Its government would consist of a governor, a cabinet of 9 to 12 members, and a unicameral legislature of 48 members elected from 24 constituencies. The People's National Congress recommended that the colony should join The West Indies federation.

Sir Ralph Grey assumed his duties as governor in November. He succeeds Sir Patrick Muir Renison, who was appointed on September 8 as governor and commander in chief of Kenya.

DONOVAN ROWSE,
Author and Publicist.

BRITISH HONDURAS. This crown colony lies south of Yucatán, Mexico, on the Caribbean Sea, and is bounded on the south and west by Guatemala. Its land area is 8,867 square miles; its population (composed of Negroes, Maya Indians, Hispano-Indians, Caribs, and Europeans) increased from 82,333 in 1956 to 88,156 at the end of 1958. The capital and chief port is Belize (pop., est., 30,000).

Government.—A governor and commander in chief (Sir Colin H. Thornley, appointed on Aug. 16, 1955) presides over an Executive Council, 6 of whose 9 members are drawn from a 15-member Legislative Assembly. All 9 elected seats in the latter body were held in 1958 by the People's United Party. Six district town boards have been reconstituted with 4 elected and 3 nominated members. Belize has now a wholly elected City Council.

In 1957 revenue was estimated at BH$8,691,319; expenditure, at BH$8,002,687 (the British Honduras dollar = U.S.$0.70). A deficit under the 1958 budget of BH$940,000 was covered by a grant-in-aid from the United Kingdom government, which has provided British Honduras with about £1 million for expenditure on development up to March 1960. The principal projects are agricultural and medical, but forestry, communications, education, social welfare, and housing also benefit.

Education.—Facilities in 1958 comprised 110 government and government-aided primary schools (17,471 pupils), 32 nonaided primary schools (1,560 pupils), 8 nonaided secondary schools (1,239 pupils), and a government technical high school (146 pupils). A residential Roman Catholic college was opened in the Stann Creek district in 1958.

Transportation.—Main roads aggregate 280 miles, and there are 131 miles of feeder roads. Five airlines serve Stanley Field, near Belize. With the opening in 1957 of a new runway at Orange Walk, airstrips throughout the colony totaled 27. A freighter-passenger vessel service connects Belize with Jamaica on a triweekly basis.

Economy.—British Honduras is a small colony with a limited economy. It is dependent chiefly on forest products, especially mahogany, logwood, cedar, dyewoods, and chicle (the base for chewing gum), but progress has been made in the cultivation of rice, cacao, bananas, and sugar and in the development of a livestock industry (some cattle are now exported). Citrus products are the main agricultural export. Marine products consist principally of crayfish (rock lobster, BH$141,685 in 1957) for the United States market; commercial fishing employs about 400 full-time fishermen.

In 1958 exports of timber were valued at BH$3,973,896 (51.2% of total exports) and comprised 61,641 cubic feet of logs (mahogany, 45,804 cubic feet) and 1,101,515 cubic feet of sawn timber (mahogany, 547,355 cubic feet). Exports (in pounds) of citrus products included oranges, 152,200; orange juice, 3,893,200; grapefruit juice, 1,284,100; and canned grapefruit, 3,883,300 (4,634,900 in 1957). Sugar exports amounted to 8,699 tons. In sterling, total imports were valued at £4,629,060; exports, at £2,271,969.

BRITISH MALAYA. See MALAYA, FEDERATION OF.

BRITISH NORTH BORNEO. See BORNEO.

BRITISH SOMALILAND. See SOMALILAND PROTECTORATE.

BRITISH VIRGIN ISLANDS. Lying east of the Virgin Islands of the United States (q.v.), this group of 36 islands (11 inhabited) forms a British colony (area, 67 square miles; pop. est., 7,600 in 1958) which is geographically part of the Leeward Islands but has not joined The West Indies federation. On Tortola, the largest island (20 square miles), is Road Town (pop., 1,200 in 1956), the seat of administration. Sage Mountain, on Tortola, rises to 1,780 feet.

The government, which is under an administrator (G. P. Allsebrook), includes an 11-member Legislative Council. On July 21, 1959, it was announced that a third elected member would be added in 1960 to the 6-member Executive Council, which now includes 3 members of the Legislative Council (2 elected, 1 nominated). The colony in 1959 reaffirmed its desire to remain under the British crown but outside The West Indies federation, except in respect to the latter's advisory and other services.

Revenue, in terms of United States currency, totaled $414,590 in 1958; expenditure, $515,857. In 1958 there were 13 primary schools, 3 community schools, and 1 private school (aggregate enrollment, 2,179); and 1 government secondary school, with 99 students. Imports totaled $664,823, and domestic exports $165,698, in 1958.

The colony is within the economic orbit of Puerto Rico and the U.S. Virgin Islands, and there has been a considerable migration of labor to St. Thomas, attracted by high rates of pay in the tourist industry there. An hotels aid ordinance (enacted in 1953) and increased United Kingdom government grants have aided the growth of the colony's own tourism. Cattle are exported to the French islands of Martinique and Guadeloupe, and the raising of fruit and vegetables is a major occupation.

BRITISH WEST AFRICA. Situated on the west coast of Africa, these three British dependencies comprise the federation of Nigeria (including the trust territory of British Cameroons), the colony and protectorate of Sierra Leone, and the colony and protectorate of Gambia. A fourth territory (the Gold Coast) became in 1957 an independent state under the name of Ghana (q.v.). The total area of British West Africa is 405,178 square miles; the combined population, 36,772,384.

The West African Inter-Territorial Council coordinates and promotes the work of numerous regional organizations, including various health, social, and economic research institutes. The governor of Nigeria is permanent president of the council, which has its headquarters and a secretariat at Accra, the former capital of the Gold Coast.

In preparation for the establishment of independence by Nigeria on Oct. 30, 1960, further steps were taken in 1959 to achieve self-government. Elections to Nigeria's first self-governing federal House of Assembly were held in December. Earlier, Northern Nigeria became the last of the territory's three regions to attain internal self-government. The new Central Bank of Nigeria issued new Nigerian currency on July 1, 1959, replacing notes of the West African Currency Board. In July the United Kingdom announced it had loaned Ni-

[1] Figures are mid-1958 estimates unless otherwise indicated. [2] Data include area, 17,500 sq. mi., and population, 759,000, of the Northern Cameroons. [3] Data include area, 27 sq. mi., and population of the federal territory of Lagos. [4] Mid-1957 est. [5] Mid-1952 est. [6] Mid-1956 est. [7] Mid-1957 est., excluding 9,600 seasonal immigrants.

geria the sum of £15 million to finance the development of ports, highways, railways, post and telegraph services, schools, and other public programs.

Sierra Leone assumed control of its own military forces in 1959. During the year the franchise was extended in Gambia to include all adults residing in the protectorate.

Nigeria

Situated on the Gulf of Guinea and containing the Niger River valley, Nigeria has been a federation under a governor general since 1954. It is administered in three regional divisions, each with its own governor: Northern, Eastern, and Western. Included for administrative purposes in the Northern Region, under a United Nations trusteeship, are the Northern Cameroons (area, 17,500 sq. mi.); the remainder of the trusteeship (16,581 sq. mi.) constitutes the Southern Cameroons, formerly included for administrative purposes in the Eastern Region, but administered separately since October 1954 (see British Cameroons). The chief cities are Lagos, the capital (mid-1958 est., 337,000) and Ibadan (500,000).

Government and Political Events, 1959.—A constitutional conference held in London in October 1958 set the date for Nigerian independence as Oct. 1, 1960, at which time this largest of the British dependencies will become the world's largest Negro nation. In 1959 the federation continued to be administered by a governor general (Sir James Robertson) or his deputy (Sir Ralph Grey), assisted by a Federal Council of Ministers composed of the prime minister and not less than 10 African ministers appointed by him. The prime minister (in 1959, Alhaji Abubakar Tafawa Balawa) is scheduled to replace the governor as chairman of the council upon the attainment of Nigerian independence. The federal House of Representatives was enlarged in 1959 from 184 to 320 elected members. An upper house or Senate with probably 12 members from each region is to be formed. Each of the three regions is self-governing and has a premier, an Executive Council, a House of Chiefs, and a House of Assembly, most members of which are elected. Southern Cameroons has an Executive Council presided over by a commissioner, and a 32-member House of Assembly and a House of Chiefs. Numerous native administrations are mainly responsible for local government.

As the result of general elections held on Dec. 12, 1959, Nigerians chose 312 members of the federal House of Representatives, which will play the major role in the government of an independent Nigeria in 1960. Seats were distributed proportionately among the regions as follows: Northern Region, 174; Eastern Region, 73; Western Region, 62; Southern Cameroons, 8;[1] and Lagos, 3. The Northern Region became the last of the regions to achieve internal self-government on March 15, when the regional premier, the Sardauna of Sokoto, succeeded the British governor as chairman of the region's Executive Council. British Colonial Secretary Alan Lennox-Boyd met with the federal and regional premiers at Lagos in May, at which time he gave assurances that Great Britain would continue technical and financial aid to Nigeria after its independence.

Finance.—Budget revenues for the 1959–60 fiscal year were estimated at £43.7 million, exclusive of £32.8 million for regional governments. Actual expenditures for 1958–59, including regional expenses, were £64,244. Expenditure in 1959–60 included £4 million for the development fund; total expenditure for the development program since 1955 totaled about £36 million as of March 31, 1958. The Central Bank of Nigeria began the issuance of new Nigerian currency on July 1, 1959.

Education.—In 1958, over 2 million of about 5 million children of primary school age attended primary schools. As the result of an extensive educational expansion program in Lagos, the number of children in primary schools was increased from 32,000 in 1956 to 79,000 in 1959. The University College at Ibadan had about 1,000 students in 1958.

Economy.—Agriculture, the most important segment of the economy, accounts for about 90% of all exports. Production of principal crops in the 1958–59 season was as follows: cocoa, 138,061 metric tons (about the same as in 1957–58); groundnuts, 583,000 (down 25% from 1957–58); cotton, 89,000 (down 21% because of a serious drought); and palm oil, 173,000 (up 4%). Other agricultural products for export include bananas, rubber, timber, and hides and skins.

Mining is growing in importance. Nigeria supplies about 5% of the world's tin and accounts for over 75% of the world output of columbite. Production of coal in 1958 was a record 926,025 metric tons. Proven petroleum reserves amount to 17 million tons; in 1958 the 20 producing wells supplied 600,000 metric tons of crude oil for export. Other minerals are iron ore, sulfur, and salt.

Foreign Trade.—Nigeria's exports in 1958 were valued at £135.6 million; imports, at a record £166.9 million. Chief exports and 1958 values were: groundnuts, £26.9 million; cocoa, £26.7 million; palm kernels, £20.4 million; palm oil, £12.6 million; timber, £6.2 million; and tin ore, £3.9 million. Major imports are machinery, transport equipment, household appliances, fabrics, cement, and food. Nigeria's chief trading partner, the United Kingdom, took 55% of Nigerian exports and supplied 43% of imports in 1958.

Transportation and Communications.—Nigeria's road network totals 37,033 miles, including 3,439 miles of surfaced highways. Government railways aggregate 1,903 miles, not including a 400-mile extension under construction in Northern Nigeria as part of the current $116 million railway improvement program. Nigerian Airways and six other main international airlines operate regular air services from Kano and Lagos. The expansion of port facilities at Port Harcourt continued in 1959. A modern telecommunications equipment program was scheduled for completion in 1960. Africa's first television system was started in Nigeria in September 1959. In 1958 there were 38,000 registered motor vehicles and 26,187 telephones.

Sierra Leone

A mountainous peninsula on the West African coast, the Crown Colony of Sierra Leone was formed in 1808; the surrounding protectorate, which borders Liberia and Guinea, was added in 1896. Sierra Leone Protectorate is divided into three provinces: Northern (13,925 square miles), South Western (7,868); and South Eastern (5,876). The population consists almost entirely of Africans, with small European and Asian minorities. Freetown, the capital, is a principal port of British West Africa.

Government and Political Events, 1959.—According to the constitution of 1958, the governor (Sir Maurice Dorman, appointed in 1956) has a veto power over vital matters. A deputy assists the governor, particularly in respect to external affairs, defense, and internal security. An all-African Executive Council consists of a premier and 11 other ministers chosen from the elected legislators. The House of Representatives has 57 members, including 39 who are elected. Premier Sir Milton Margai heads the majority political group, the Sierra Leone People's Party.

Finance.—Government revenues for the 1959 fiscal year ending in March totaled £10,517,835; expenditures, £10,886,157.

Education.—Education is not compulsory. In 1958 there were 522 primary schools with 69,276 pupils, and 25 secondary schools with 5,904 pupils. In addition, 6 teacher-training colleges had 604 students, and 6 technical and vocational institutions enrolled 450 full-time and 872 part-time students. Fourah Bay College had 265 students in 1957.

Economy.—Agriculture employs over half the population, and 56,287 persons were engaged in mining and light industries in 1956. Chief crops for export are palm kernels and coffee (66,952 cwt. exported in 1958), and the main subsistence crop is rice, grown chiefly in the protectorate. Other agricultural products are cocoa, piassava, peanuts, ginger, kola nuts, benniseed, bananas, peppers, and chilies. Principal minerals with 1958 production figures are: iron ore, 1,299,937 tons; diamonds, 1,490,037 carats; and chromite, 14,236 tons.

Foreign Trade.—Sierra Leone's exports in 1958 were valued at £19,613,058 (up 7% over 1957); imports, £23,903,129 (down 18%). Leading exports in 1958 included diamonds, valued at £8,518,545; iron ore, £4,490,460; and palm kernels, £2,448,256. Among the principal imports are petroleum products, motor vehicles, base metals, fabrics, and rice. Over half the territory's trade is with the United Kingdom.

Transportation.—Government railways aggregate 394

[1] Scheduled elections for the 8 seats representing Southern Cameroons were postponed, pending the results of a plebiscite to be held in 1960 which is to decide whether or not the territory will join an independent Nigeria.

BRITISH INFORMATION SERVICE

Horsemen en route to Kaduna, capital of the Northern Region of Nigeria, where they joined 10,000 tribesmen at a durbar on May 15, celebrating the region's attainment of self-government in March. Moslem month of fasting had delayed festivities.

miles. There were 2,992 miles of highways in 1958. Three international airlines operate out of the airport at Lungi, near Freetown.

Gambia

This crown colony, situated at the mouth of the River Gambia on the West African coast, comprises St. Mary's Island (area, 2,500 acres) and the adjoining division of Kombo St. Mary (mid-1957 est., 7,800). The protectorate extends inland some 200 miles on either bank of the river in strips of territory rarely exceeding 7 miles in width. Bathurst, on St. Mary's Island, is the capital and chief port; main towns in the protectorate are Brikama, Mansa Konko, Georgetown, and Basse.

Government.—The governor (Sir Edward H. Windley assumed office in 1958) is assisted by an Executive Council comprising at least 6 appointed members of the elected legislators. The Legislative Council consists of 21 members, of whom 11 are directly elected and 3 are indirectly elected, as well as a speaker and the governor, who serves as council president. On Sept. 23, 1959, the franchise, which had been limited to residents of the colony, was extended to all adults in the protectorate.

Finance.—Revenue in 1958 was £1,895,006 (£2,128,107 in 1957); expenditure (including £130,560 on education), £1,961,539.

Education.—In 1959 there were 49 government and mission primary schools with a total enrollment of 7,550 pupils, and 5 secondary schools with 829 pupils. Yundum College had 52 students.

Economy.—Gambia's exports in 1958 were valued at £4,109,118; imports, at £3,908,801. Peanuts is the major crop and accounts for over 90% of annual export value. Output of unshelled peanuts in 1958 totaled 62,931 tons. Other exports are oil cake, palm kernels, and hides and skins. Rice is the second major crop.

Transportation.—Internal transportation is furnished primarily by river steamers, one of which provides post office facilities. The colony has 39.5 miles of surfaced roads, and the protectorate, 967 miles of earth roads. There are no railways. Gambia is served by Air France and West African Airways, which connect Bathurst with the capitals of Sierra Leone and Ghana, and with Europe.

BROADCASTING. See Federal Communications Commission; Radio and Television.

BROWN, Edmund Gerald (Pat), American political leader: b. San Francisco, Calif., April 21, 1905. Elected governor of California in November 1958, Brown defeated Sen. William F. Knowland by more than a million votes and brought in with him the state's first Democratic-dominated legislature since 1889. Having followed this triumph with a year of vigorous leadership, he inevitably became a subject of great interest, both as a possible candidate for the Democratic presidential or vice presidential nomination in 1960 and as leader of the nation's second-largest delegation (81 votes) to the Democratic National Convention. He was expected to go to the convention in July as California's favorite-son candidate for the presidential nomination.

Following his graduation from San Francisco Law School and admission to the state bar in 1927, Brown plunged at once into politics. Originally a Republican, he switched to the Democratic Party as a supporter of the New Deal in 1934. In 1939 he ran for San Francisco County district attorney, lost, ran again in 1943, and was elected. He was defeated as candidate for state attorney general on the Democratic slate in 1946, but in his next try, in 1950, he was the Democrats' only victor for major office and established himself as the party's best vote-getter. The performance was repeated in 1954.

In the first session of the state legislature in 1959, he compiled a record of 35 victories and only five defeats on major issues. He achieved major legislation in highly controversial areas—most importantly, a first-step $1,750 million water resources development program (subject to ratification by the electorate in 1960) that broke a long-standing North-South stalemate within the state. Other major actions included tax increases to stabilize the budget, abolition of cross-filing in California elections, antidiscrimination legislation, a crackdown on abuses against immigrant farm laborers, and a thoroughgoing reorganization of the state's executive branch. (See also California.)

BUDGET, U.S. See Treasury Department.

BUILDING AND CONSTRUCTION. New Construction Put in Place.—Keeping pace with the economy, the value of new construction put in place in 1959 reached a new peak of $54 billion, a 10% gain over 1958. The high rate of construction activity prevailed throughout the year, although the prolonged steel industry work stoppage (see IRON AND STEEL) had a somewhat depressing effect toward the end of the year. As in recent years, both private and public construction shared the gains, with the former accounting for 70% of the total. Although rising costs of approximately 3% played a role in elevating the 1959 value of new construction put in place, the physical volume of construction still rose by about 7%.

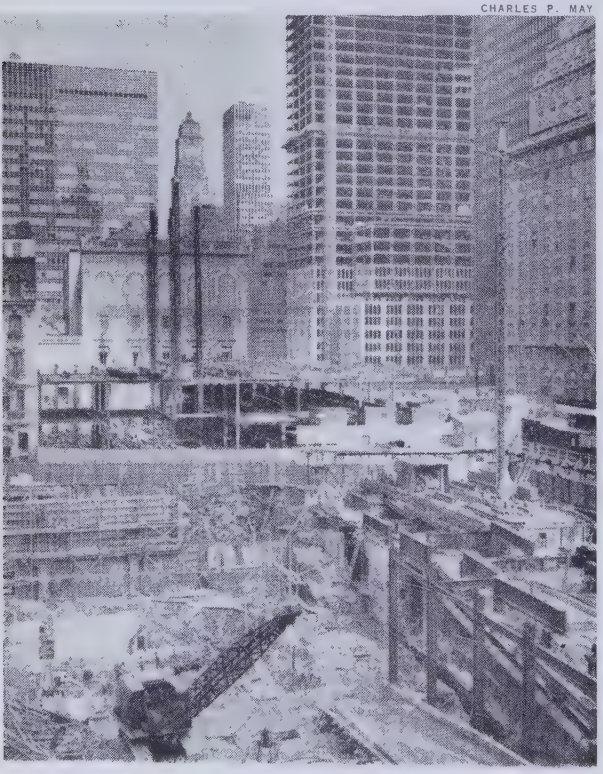
In the private sector the $38 billion expended represented a 13% increase over 1958. The strongest element in the increase was nonfarm housing, with a 23% rise from $18 to $22 billion. Expenditures for commercial, industrial, and other nonresidential buildings declined slightly, 1%, although within the commercial category, stores, restaurants, and garages marked up a 22% increase. Farm construction followed the general pattern with a 19% rise. Public utilities showed virtually no change.

Total public construction activity at $16 billion reflected an almost $1 billion increase over 1958. Expenditures by the federal government, rather than by state and local governments, provided the greater stimulation to public construction activity in 1959, because of the impact of federal contracts let in 1958 to counteract the then prevailing recession. In 1959, federal outlays on construction increased by about 20%; outlays by state and local governments changed negligibly.

Thus, construction categories associated with federal programs displayed the greatest increases during 1959. Highway construction (see HIGHWAYS) at a new peak of $5.8 billion was up 5%. Similarly, military projects at $1.5 billion were up 6%. Conservation and development work registered a 13% rise to approach a record $1.2 billion. Categories based mostly on state and local government funds were less impressive in 1959. Public educational building at $2.7 billion declined by 7% from the previous year. Sewer and water systems, achieving a $1.5 billion record outlay, moved up 6%.

Typical of the building boom in New York City is this view of a section of Park Avenue in mid-Manhattan. Two office buildings are shown in early stages of construction, while the skeletal structure of another rises in the background.

CHARLES P. MAY



New Housing.—In 1959, starts of privately and publicly owned new nonfarm dwelling units exceeded 1.3 million, 16% more than in 1958 and almost at the all-time peak of 1950. Only 35,000 units started were publicly owned. As in earlier years, about 70% of the new housing starts were in metropolitan areas. The average construction cost of new private one-family houses, more than four fifths of the total, was about $13,300, exceeding that of 1958 by $350.

The increasing role of the multiple-family structure in 1959 continued a trend evident since 1955. In terms of actual numbers, there were more units started in rental type buildings in 1959 than in any year since 1928. A decade had passed since multiple-dwelling starts accounted for as high a ratio (20%) of new housing units as they did in 1959.

Although a tightening money situation became evident around the middle of 1959, housing starts were not appreciably affected until the last quarter of the year. The proportion of dwelling units started under Federal Housing Administration and Veterans Administration mortgage insurance, about one third, remained about the same as in 1958. VA homes, which accounted for 8% of all private housing starts in 1959, were, however, down sharply from earlier years. In view of the high level of 1959 starts compared with 1958, there was a substantial increase of 18% in the number of homes built under the government mortgage insurance programs. (See also HOUSING.)

Building Permits.—Although building permits cover only a portion of total construction, the statistics derived provide useful detailed information on geographic distributions of construction work authorized during the year.

The value of all building construction authorized by permits in 1959 amounted to $23 billion, a 16% gain over 1958. Private work valued at $20.5 billion rose 20%, whereas public work decreased almost 25%.

Building permit valuations rose in each of the four major geographic regions of the United States, with the Northeast marking up the greatest increase, 30%. The more than 100% growth in office building construction in the Northeast was the most dramatic jump, probably attributable to the office building boom in New York City. It is noteworthy that about one fourth of construction authorized by building permits took place in the states of New York and California, which showed gains in 1959 of 50% and 25%, respectively.

Construction covered by permits declined in a few states. The District of Columbia recorded a 60% decline.

Construction Costs.—After a year of relative stability in 1958, construction costs in 1959 moved upward 3% over the earlier year, according to the U.S. Department of Commerce composite index. The 1959 level was more than 40% over the 1947–49 base period. Prices of materials and average hourly earnings of construction workers rose by an average of from 2% to 4%, but all major components of construction costs did not move accordingly. (See also HOUSING.)

Employment and Earnings.—In 1959 contract construction employment, at a monthly average level of 2.8 million, was up 5% over 1958. The 1959 level, approximating those of 1955 and 1957, was significantly exceeded only in 1956, when 2.9 million were employed. Employment dropped to a low of 2.3 million in February 1959 and reached a peak of 3.1 million in August. About 80% of the employees were in building construction activities, while the balance was engaged in highway and other nonbuilding construction pursuits, a proportion which prevailed during recent years. Among the building construction workers, slightly less than two thirds were connected with the special trades, such as plumbing, painting, and electrical work. The other third was employed by general building contractors. California, with almost 300,000 contract construction workers, and New York with 250,000, were chief employment centers.

In general, hourly and weekly earnings for all types of construction workers were higher in 1959 than 1958. Weekly earnings in 1959 averaged $115, based on an average work week of 37 hours at more than $3 per hour.

Weekly earnings were $5 greater than those in 1958, principally because hourly earnings went up. Hours of work were almost unchanged. Special trades workers, who earned $120 per week, topped all others, while employees of general contractors trailed at $107 per week.

BENJAMIN D. KAPLAN,
Acting Director, Construction Industry Division, Business and Defense Services Administration.

BULGARIA. A Soviet-dominated people's republic, bounded on the north by Rumania, on the east by the Black Sea, on the south by Greece and Turkey, and on the west by Yugoslavia.

Area and Population.—Bulgaria has an area of 43,047 square miles and a population (est. mid-1958) of 7,722,000, almost two thirds of which is rural. Sofia, the capital, had 725,756 inhabitants at the 1956 census. Other leading cities (with 1956 populations) are Plovdiv (162,518), Varna (119,769), Ruse (83,472), Burgas (72,795), Dimitrovo (Pernik, 59,721), Pleven (57,758), and Stara Zagora (55,322). The major ethnic groups (est. 1952) are Bulgarians (91%), Turks (6%), and gypsies (2%).

Government.—The Bulgarian People's Republic was proclaimed on Sept. 15, 1946. According to the constitution of 1947, the highest organ of the government is the unicameral National Assembly (Narodno Sobranie), consisting of 254 deputies. Although the constitution supposedly guarantees free elections, citizens cannot organize their own parties or place on the ballot candidates for the National Assembly who are unacceptable to the Communist Party. The National Assembly elects and, when not in session, is represented by its Presidium; its chairman is Dimiter Ganev, elected on Nov. 30, 1958, to succeed the late Georgi Damyanov. The National Assembly also appoints the cabinet, which since April 17, 1956, has been headed by Premier Anton Yugov. In March 1959 the government was reorganized (see below, *Principal Events*).

Bulgaria has a totalitarian system of government which controls every phase of national life. Political power is vested in the Politburo, an organ of the Central Committee of the Communist Party. The party, which claims 485,255 members (1958), is the dominant force in the Fatherland Front (Otechestven Front), which also includes the Agrarian National Union, headed by Georgi Traikov, and splinter groups of one-time democratic parties which accepted Communist rule. The last parliamentary elections (Dec. 22, 1957) gave Fatherland Front candidates nearly all the votes cast.

Education.—Elementary education is obligatory between the ages of 7 and 15. In April 1959 the Central Committee of the Communist Party announced certain changes in the educational system; henceforth students will have to spend some time as workers in industry and agriculture. In 1957, Bulgaria had 6,803 elementary schools (including 1,116 for Turkish-speaking pupils) with 830,000 pupils, 250 secondary schools with 200,000 students, and 230 vocational schools with 58,842 students. The University of Sofia, the country's most important institution of higher education, and 31 other institutions had a combined enrollment of 37,049. About 1,000 students were attending specialized schools in the Soviet Union.

Religion.—The principal religious groups (est. 1952) are the Orthodox (89.07%), Moslem (9.54%), Roman Catholic (0.78%), Protestant (0.13%), and Jewish (0.04%). Leadership and administration of the Bulgarian Orthodox Church are vested in a Holy Synod, comprised of the patriarch as head of the church and the metropolitans of the 11 dioceses (the patriarch serves as the metropolitan of the Sofia diocese). On May 10, 1953, Metropolitan Kiril of Plovdiv was chosen patriarch in a contrived election that was denounced by the patriarch of Constantinople. The cultural and spiritual work of religious institutions has been drastically reduced.

Finance.—The 1959 budget called for revenues of 27,100 million leva and for expenditures of 26,900 million leva, of which 17,500 million were earmarked for the national economy, 5,600 million for social and cultural undertakings, and 1,700 million for national defense. The Bulgarian lev is linked to the Russian ruble at the ratio of 1.70 leva to 1 ruble; 6.80 leva (9.50 at the tourist rate) equal U.S.$1.

Defense.—The peace treaty of 1947 limited Bulgaria's armed forces to 65,000 officers and men. In 1957 they were estimated to total 200,000, although at the meeting of the Political Consultative Committee of the Warsaw Treaty Organization on May 24, 1958, it was presumably agreed that the army would be cut down somewhat. The naval tonnage exceeds the maximum (7,250 tons) established by the peace treaty. Bulgaria has 1 destroyer, 3 or 4 submarines, 2 patrol vessels, and about 30 torpedo boats. The ports of Varna, Burgas, and Sozopol have been developed to accommodate Soviet naval craft. The Soviet Union has built 10 airfields for jet planes, of which those at Tolbukhin (Dobrich), Yambol, Pleven, and Sofia are the largest. The Bulgarian Air Force also exceeds the size (90 planes) established by the peace treaty.

Transportation and Communication.—Bulgaria's road system (1956) totals 15,870 miles, and the rail network (1957), 2,670 miles. In 1957 the tonnage of the Black Sea fleet was estimated at 26,000, and the Danube fleet consisted of 42 ships. Bulgaria has over 300,000 radios and a very few television sets.

Agriculture.—The number of collective farms, which in November 1957 totaled 3,158 and comprised 960,000 households, was reduced as a result of mergers to 625 collectives with the same number of households by December 1958. Numerous changes were introduced in agriculture during 1959. In February a system of daily wages was established on collective farms, and in April compulsory deliveries were replaced by a contractual purchasing scheme under which prices were raised to a position about 50% below free market prices.

According to Bulgarian newspapers, the country has recently experienced shortages of fruits and vegetables, especially in the larger cities. One paper complained that farmers have refused to market their crops. There was evidence that the collective farms, in connivance with local officials, have circumvented compulsory deliveries and have sold their produce on the free market at higher prices.

The agricultural phase of Bulgaria's so-called "big leap forward" calls for expanded production of maize (corn), sunflower seed, sugar beets, wool, cotton, and livestock through greater use of farm machinery and fertilizers and the expansion of irrigation facilities. Chief crops and 1957 yields (in thousand metric tons) were: wheat, 2,375; maize, 1,461; sugar beets, 1,464; sunflower seed, 208; tobacco, 73; and grapes, 570.

Industry.—Industrial production in 1958 reportedly exceeded planned estimates by 6% and was up 16% over that in 1957. In mid-January 1959 the first secretary of the Communist Party, Todor Zhivkov, announced a series of drastic changes in economic planning and administration. He proposed a doubling of Bulgaria's industrial production by 1962, and the telescoping of the Third Five-Year Plan (1958–62) into a three-year plan. The goal for 1959 provided for increases of 27.8% in industrial production, 43% in capital investment, and 73.9% in agriculture. A new system of economic administration provided for the establishment of 30 provincial economic units with broad local powers. Machine-tractor stations and some local industries were to be collectivized.

Planned production goals in certain basic industries for 1962 and 1965, as compared with 1958 actual output, are as follows (in metric tons):

	1958	1962	1965
Steel	211,000	400,000	900,000
Pig iron	...	230,000	700,000
Lead	26,000	45,000	90,000
Coal	12,730,000	23,772,000	...
Cement	934,000	2,300,000	...
Chemical fertilizers	...	1,000,000	1,600,000
Electric power (million kw.-hr.)	3,024	6–7,000	10,000

The government admitted in late 1959 that more than 30% of state enterprises were behind in planned production, but noted that satisfactory results were being obtained in the output of electric power, pig iron, steel, lead, and cement.

Foreign Trade.—As a result of postwar industrialization, Bulgaria's exports of manufactured and semimanufactured goods have increased from 19.6% of total exports in 1939 to 60% of the total in 1956. Its foreign trade with the Soviet bloc in 1955 amounted to 89.9% of exports and 86.3% of imports, of which 46.7% of exports and 45.7% of imports were exchanged with the USSR. In 1959, Bulgaria made a trade agreement with Communist China covering the period 1959–62.

Exchanges of goods with Middle Eastern, Asian, and western European countries has steadily increased since 1955. In 1957, trade with the West

was estimated at $100 million, of which the major share was with West Germany, Austria, Italy, Great Britain, France, and Switzerland. Principal Bulgarian exports to the West are foodstuffs, chemicals, and steel; leading imports from the West are machinery, metals, fertilizers, dyes, yarns, and vehicles.

Principal Events, 1959.—Communist First Secretary Todor Zhivkov proposed in January significant changes in the country's government and administration aimed at decentralizing authority. The changes involved abolition of some ministries and the creation of 30 new districts in place of the existing 13 districts and 117 counties. The new districts were to be entrusted with jurisdiction over local political, cultural, and economic affairs. The functions of the abolished ministries were to be discharged by special commissions, their primary task being to coordinate the work of the districts. The plans provided for the transfer of 140,000 employees of the central administration to "more productive" jobs. The National Assembly approved Zhivkov's proposals on March 14. Six ministries were abolished and some of their occupants were appointed as chairmen of special commissions in the reorganized cabinet.[1]

Bulgaria celebrated the 15th anniversaries of its "liberation" from Nazi occupation and, on September 9, of the "socialist revolution." Many eulogies were paid to the "gallant Red Army" for the nation's liberation, and Premier Anton Yugov, in a major address, predicted the triumph of socialism.

One of the most important developments in foreign relations during 1959 was the resumption on March 27 of diplomatic relations with the United States which had been severed in 1950. The renewal of relations was followed by the lifting of the United States tourist ban to Bulgaria on May 12 and the gradual restoration of trade intercourse between the two countries.

On May 26 the International Court of Justice announced that the compensation claims which Israel asked from Bulgaria for the downing of an Israeli airliner by Bulgarian planes on July 27, 1955, did not fall under its jurisdiction.

Bulgarian dignitaries made several important visits to friendly Communist states during the year. In May, Bulgaria took part in the meeting of the Council for Mutual Economic Assistance held in Tiranë, Albania, and a group headed by Zhivkov and Yugov visited Czechoslovakia and Hungary. In January the Bulgarian Communist Party sent representatives to the 21st congress of the Soviet Communist Party at Moscow.

In regard to Soviet Premier Khrushchev's visit to the United States in September, Sofia Radio told its listeners that "all peoples" anticipated good results from the Khrushchev-Eisenhower meetings. It expressed hope that "the ice of the cold war for which the Soviet Union was not responsible will melt," but cautioned its audience not to expect any changes in regard to the "status of the countries of eastern Europe."

Following Khrushchev's proposal for a denuclearized zone in the Balkans, Bulgaria, on July 22, sent a draft of a proposed 20-year nonaggression pact to Greece. On July 31, Greece replied that the United Nations charter which both countries had signed already contained a declaration renouncing war as a means of settling disputes. In a note on August 7, Bulgaria accused Greece of distorting the principle of the United Nations charter in order to justify its participation in NATO.

During the first part of the year Sofia launched a vigorous propaganda campaign against the Yugoslav regime. Relations with Yugoslavia remained strained, although the propaganda campaign subsided somewhat in the final months of the year. According to an announcement from Belgrade on August 28, a trade agreement was concluded between Bulgaria and Yugoslavia under which the latter promised *inter alia* to supply Bulgaria with 16,570 tons of wheat for seed.

WAYNE S. VUCINICH,
Professor of History, Stanford University.

[1] Tano Tsolov, formerly minister of heavy industry, was appointed chairman of the Committee for Industry and Technical Progress; Kimon Georgiev, formerly minister of electrification and water economy, was transferred to the Committee for Construction and Architecture; and Stoyan Tonchev, formerly minister of communal economy, was made chairman of the Committee for Labor and Prices. The heads of other abolished ministries, Stanka Tsekova, Atanas Dimitrov, and Radenko Vidinski, were relieved outright, as was the minister of trade, Boris Taskov, who reportedly lacked confidence in the ultimate success of Bulgaria's "big leap forward."

BUREAU OF EMPLOYMENT SECURITY. The Bureau of Employment Security (BES) of the U.S. Department of Labor is the federal partner in the federal-state system of employment security agencies. The bureau's employment service and unemployment insurance functions are discharged through the United States Employment Service (USES) and the Unemployment Insurance Service (UIS).

Labor Market Conditions.—The operating statistics for the fiscal year 1959 reflected the improvement in economic conditions which began in late 1958. Industrial production (seasonally adjusted), which had dropped to a low of 126% of the 1947–49 average in April 1958, rose each month throughout fiscal 1959 to an all-time high of 155% in June 1959.

Civilian employment, after dropping to a recession low of 62.0 million in February 1958, increased to 65.4 million by August, but dropped to a seasonal low of 62.7 million in January and February 1959. Employment gained rapidly thereafter and by June 1959, aggregated a record 67.3 million, which was 2.3 million above the June 1958 level and 800,000 above the prerecession level of June 1957.

The peak of recession unemployment (5.4 million) was reached in June 1958. There was a rather rapid drop in joblessness in the four succeeding months, until the usual seasonal rise during the winter. The downward trend was resumed in March 1959 and continued through May, but the jobless total rose again in June—as it does each year with the entry of high school and college graduates and students into the labor market. The seasonally adjusted national rate of unemployment dropped from 7.3% of the civilian labor force in July 1958 to 5.1% in July 1959.

Insured unemployment under state unemployment insurance programs, which had risen to nearly 3.3 million in April 1958 during the midst of the recession, dropped each month thereafter through October. Seasonal factors brought the usual midwinter increase, but the downward trend began again in February 1959 and continued to the end of the fiscal year. In June 1959, insured unemployment was 1.3 million, or one half the level of a year earlier and only slightly above June 1957.

The general economic recovery was reflected in the reclassification of a number of major labor market areas to categories indicating relatively better balance between labor supply and demand. In the July 1958 classification listing, 89 major areas were characterized as having a substantial labor surplus; a year later only 46 areas were so characterized. In addition, the number of smaller

areas designated as areas of substantial labor surplus dropped from 182 on the July 1958 listing to 143 in July 1959.

United States Employment Service.—In addition to its basic function of working with state employment services to assist workers to find jobs and employers to find workers, the USES operates a Veterans Employment Service and a Farm Placement Service. Specialized assistance to state employment services for the occupational adjustment of workers and the solving of manpower problems for employers is also part of the USES responsibility.

In the fiscal year 1959, the increasing labor demand generated by the increasing pace of the economic recovery resulted in a drop of about 1 million in new job applications to a total of 9.4 million. Total job placements by public employment service offices, which had dropped to 13.9 million under the impact of the recession in the fiscal year 1958, registered a substantial gain during the business recovery to 15.3 million in fiscal 1959.

Employment counseling services were provided to more than 1 million individual job seekers in fiscal 1959, the largest total for any 12-month period. Total counseling interviews numbered 1.7 million.

Unemployment Insurance Service.—Unemployment insurance is designed to protect wage earners and their families from wage loss through involuntary unemployment by paying, if no suitable jobs are available, weekly benefits related to their former wages, for varying periods (depending on state laws).[1]

Each state and the District of Columbia has its own unemployment insurance law and operates its own program within the framework of the federal laws. The federal government grants funds to the states to cover the cost of administering the programs. The Unemployment Insurance Service carries the federal responsibility for reviewing state laws and their administration to determine whether the states qualify for these grants and whether employer contributions paid or excused under such laws may be credited against the federal unemployment tax.

In fiscal year 1959, the states received about $307 million in federal grants to cover the cost of administration of the state unemployment insurance and employment services and of veterans and federal employees programs. For benefit payment purposes, states collected about $1,675 million in contributions (which were deposited to their accounts in the federal Treasury) and received interest on their current accounts totaling some $179 million. On June 30, 1959, the balance in the Federal Unemployment Trust Fund amounted to about $6.8 billion. Benefits paid out during fiscal 1959, including those under the temporary programs, totaled more than $3.9 billion, which was about $600 million more than in fiscal 1958 and higher than in any previous fiscal year. Of this total, approximately 18% was paid under the temporary extended programs.

Many state legislatures strengthened their unemployment insurance systems in 1958 and 1959. Twenty-seven states, whose programs include over 60% of all covered workers, now provide a maximum basic weekly benefit of $35 or more. Fifteen of these, with over 30% of all covered workers, have a basic benefit of $40 or more. In 1958 and 1959, several states increased the maximum augmented weekly benefit amount for claimants with dependents. Eleven states now have higher maximum weekly benefits for such claimants, varying from $45 to $65 and, in Alaska, to $70 (limited to claimants in Alaska with dependents in the state).

Fifteen states liberalized their duration provisions during 1958 and 1959. Eight states, with 25% of the covered workers, now have a uniform duration of 26 weeks or more for all eligible claimants, the objective set by President Eisenhower. Thirty-three others, with about 60% of the covered workers, have a variable duration with a maximum of 26 weeks or more. At the present time, six states have laws providing that whenever unemployment rises above specified levels, the duration of benefits will automatically be increased for the period of high unemployment. In general, the rate of insured unemployment is used as the measure of the need for such extension.

In response to the increased number of unemployed workers who exhausted all their benefits during the recession of 1957–58, Congress passed the Temporary Unemployment Compensation Act of 1958 to provide benefits for longer periods of time. The Bureau of Employment Security was given responsibility for directing the temporary program under this act in cooperation with states agreeing to participate. The program was in effect throughout fiscal 1959. Sixteen states and the District of Columbia signed agreements with the secretary of labor to participate fully in the program. In addition, five states established their own temporary programs to extend benefits independent of the federal program. About 70% of all workers covered under state and federal unemployment insurance laws (excluding persons covered by the Railroad Unemployment Insurance Act) were covered by these temporary programs.

The Temporary Unemployment Compensation Act fulfilled a definite need in the overall federal-state unemployment insurance system. Under the federal program, from its inception in June 1958 through June 30, 1959, almost 1.6 million persons who had exhausted their regular benefits were paid more than $474 million in temporary benefits. In the five states operating their own temporary programs, an additional amount of more than $126 million in benefits were paid to approximately 432,000 persons who had exhausted their regular benefit rights. It is estimated that, on the average, almost 10 additional weeks of benefits were paid to each beneficiary under these temporary programs.

Special Employment Services.—During the 1959 fiscal year, the bureau and the state employment security agencies stepped up their continuing efforts to improve the effectiveness of employment service operations. Actions taken by the bureau included assistance to state agencies in improved organization and management techniques; development of training materials and training programs to advance the competence of field supervisors, local office managers, and employment counselors; and development and validation of additional aptitude and proficiency testing material, including the wider use of the USES-developed General Aptitude Test Battery (GATB).

Older workers continued to be one of the major groups to receive added emphasis in educational and promotional activities designed to encourage greater acceptance of the experience and qualifications of middle-aged and older workers and to

[1] The programs are financed through a combination of federal and state tax measures. The Federal Unemployment Tax Act levies a tax on employers in commerce and industry throughout the country and allows them credit (up to 90% of this tax) for the contributions they pay under state unemployment insurance tax laws. The act is limited to employers who within a year had four or more workers in each of 20 weeks. Almost half of the state laws cover firms with fewer than four workers. Railroad employees are covered under a separate system administered by the federal Railroad Retirement Board.

counteract prejudicial employer attitudes with respect to the hiring of older workers.

Evidence that the older worker program of the USES is having results is indicated by the 1.1 million job placements of workers 45 years and older made by public employment offices in the fiscal year 1959. During the year, 115,000 older workers were provided employment counseling services.

Another major activity of local public employment offices involves special programs to aid young people in starting their working careers. These programs include counseling, testing, and placement service for high school graduates and dropouts, and special job development campaigns for students having summer jobs and part-time work. One measurement of the scope of this activity is the fact that out of the 1958 graduating class, 244,346 seniors in 8,301 high schools received employment counseling and, in most cases, aptitude testing from their local employment services.

In the highly specialized field of placing physically handicapped workers in jobs utilizing their abilities, the local employment service offices continued to maintain a high standard of accomplishment. Through the USES-developed techniques of selective placement, employment counseling, and working with other interested groups, both governmental and private, the local employment offices provided job-counseling services to 159,157 handicapped workers in the fiscal year 1959 and placed 279,638 in jobs. The promotional and educational activities of the President's Committee on Employment of the Physically Handicapped, and of the subsidiary governors' and mayors' committees, as well as the rehabilitation work of the Office of Vocational Rehabilitation of the Department of Health, Education, and Welfare, have contributed significantly to the continuing accomplishments of local employment service offices in the job placement of physically handicapped workers.

Job Counseling and Placement Services to Veterans.—This statutory responsibility is carried out by the local offices of the state employment services under the functional supervision of the Veterans Employment Service through its state veterans employment representatives. In fiscal 1959, 1,780,000 veteran applicants registered for work in local employment offices, a drop of some 27% from the preceding fiscal year. During this same period local employment offices made 1,291,000 job placements of veteran applicants, representing an increase of 5% over the previous year. Local employment offices provided counseling services for 145,000 veterans, of whom 46,800 were disabled. During this period 131,500 disabled veterans registered with local employment offices, through which 111,900 disabled veteran placements were made. (See also VETERANS ADMINISTRATION.)

Community Employment Planning.—The USES continued in fiscal 1959 to encourage the state and local offices of the employment security system to participate in economic development activities and bring their special skills and resources to bear upon the tasks of planning for employment development and creating new job opportunities. In order to promote participation, the bureau prepared a pamphlet entitled *Community Organization for Employment Development,* which describes different types of development committees and outlines steps in their formation. State employment service local offices were cooperating with 1,850 community employment development organizations. Exhibits for display at fairs and industrial development meetings were provided to the states to publicize the USES and its role in employment planning.

Farm Placement Service.—According to biweekly reports throughout the fiscal 1959 farm season from 267 of the nation's important agricultural areas, there were over 1,355,000 seasonal hired workers employed at the peak of the season (mid-October 1958). Placements of domestic workers on farm jobs in fiscal 1959 totaled 9,615,163. In addition there were 447,760 Mexican nationals contracted, 6,900 Canadians employed, and 10,030 British West Indians admitted temporarily to the United States for farm employment.

Advance scheduling of migrant farm labor crews, first started in 1949 and called "The Annual Worker Plan," was participated in by nearly all states needing migrant labor, with 6,833 crews or groups, comprising an estimated 140,000 workers, involved in the calendar year 1958. State employment services made maximum use of local workers, including school youths, through day-haul transportation programs before requesting out-of-area workers.

Unemployment Benefits for Federal Military and Civilian Employees.—Included in the framework of the federal-state unemployment insurance system are three groups whose benefits are paid from federal funds—veterans, former federal civilian employees, and ex-servicemen. The federal program covering veterans with service prior to Jan. 31, 1955, will expire after Jan. 1, 1960. This program entitles a veteran to $26 for a week of total unemployment up to a total of $676. In August 1958, Congress enacted a permanent program (the Ex-Servicemen's Unemployment Compensation Act of 1958) to cover members of the armed forces. Benefits are payable under the conditions of the law of the state where the ex-serviceman files his first claim.

During fiscal 1959, more than 305,000 individual veterans and ex-servicemen filed claims, and about $97 million in benefits were paid under the two programs. From the inception of the veteran's program in October 1952 through June 30, 1959, more than 1.6 million individual veterans filed claims and nearly $452 million in benefits were paid.

In fiscal 1959, approximately 156,000 workers whose most recent employment had been with the federal government filed claims. More than $55 million in benefits were paid to federal civilian employees for an estimated 1.8 million weeks of unemployment.

ROBERT C. GOODWIN,
Director, Bureau of Employment Security.

BUREAU OF MINES. See MINING.

BUREAU OF STANDARDS. See NATIONAL BUREAU OF STANDARDS.

BURMA, Union of. A former British dependency, this independent republic of southeast Asia, bounded by India on the northwest and Communist China on the northeast, came formally into existence on Jan. 4, 1948. The total mainland area (263,589 square miles) consists of Burma proper (162,290 square miles, including the Chin Hills); Shan State (61,090); Kachin State (33,903); Kayah State (formerly Karenni States, 4,506); and Karen State (1,800). Burma's sovereignty also extends over the Coco Islands (used as a prison camp starting in 1959) in the Indian Ocean some 270 miles southwest of Rangoon.

Population.—On the basis of a partial census, the population was estimated at 18,859,000 in 1953, and at roughly 20 million in 1957. The inhabitants of Burma belong to many races and speak many languages. Besides indigenous Tibeto-Burmans, the population includes large numbers of Chinese, Indo-Burmans, and Indians. Buddhism is the principal religion. The capital and chief port is Rangoon (pop., 737,079 in 1955); other principal cities (and 1955 populations) are Mandalay (185,867), Moulmein (102,777), and Bassein (77,905).

Government.—Parliament consists of the president (U Win Maung, who took office on March 13, 1957); a 125-member Chamber of Nationalities (partly elected by direct suffrage and partly nominated by the various states); and an elected 250-member Chamber of Deputies. Each state has its own legislature. General elections were planned for early 1960, following the renomination as prime minister of Gen. Ne Win, the army chief of staff, who took over the government headed by U Nu on Oct. 29, 1958 (see below, *Principal Events, 1959*).

Finance.—The unit of currency is the kyat (K4.7667 = U.S.$1, average value in 1958). Reduced by the imposing of price controls and the limitation of profit margins after the change of government in 1958, revenue receipts were estimated at K955,300,000 in 1958–59; expenditure was cut back to K935,700,000, but a deficit was anticipated on capital account of K47,600,000. In 1959–60 revenue was estimated at K964,500,000, with provision for an overall deficit of K70 million. A substantial part (K270 million) of total capital outlay was to be funded by loans granted by the International Bank for the development of Burma Railways and the port of Rangoon, and by financial aid from various foreign governments (see below, *Principal Events, 1959*).

Education.—Education is free at primary level, but in an attempt to tighten discipline the government decided in 1959 to levy fees from middle and high schools. In 1957 there were 10,921 primary schools (1,649,201 pupils); 453 middle schools (238,456 pupils); and 235 high schools (89,126 pupils). Besides the University of Rangoon, the government maintains in that city the State School of Fine Arts, Music, and Drama, and a teacher-training college. There are also five intermediate colleges and a number of technical and vocational institutes. The University College, Mandalay, was raised in June 1958 to the status of a university.

Transportation and Communications.—Diesel engines were introduced along the main line of the government-owned railways in 1958. Passengers carried in 1957–58 increased to 26,877,000 from the previous year's total (25,500,000, est.); 2,750,000 tons of freight were loaded compared with 2,200,000 tons in 1956–57. The Irrawaddy Delta has nearly 2,000 miles of navigable water. Passengers using services of the Inland Water Transport Board numbered 5,307,000 in 1957–58—an increase of 707,000 over the previous year. The Union of Burma Airways, using 34 civil airports and landing fields, carried 83,000 passengers in 1957–58 on 30 internal and 13 external flights weekly; nine international airlines use the Mingaladon, Rangoon, airport. There were 8,825 miles of main and district roads in 1955, of which 4,299 miles were surfaced. With United States financial aid, and using studies carried out by the U.S. Army Corps of Engineers, a major highway has been planned to link Rangoon with central Burma.

Agriculture.—Paddy acreage was estimated in 1958–59 at 10,194,000, and rice production (a principal source for Burma of foreign exchange) at 6,267,000 tons—an advance of more than a million tons on the 1957–58 output. Two million tons of rice were available for trading, but marketing difficulties were expected to hold down exports to about 1 million tons, including 350,000 tons exported to India under the Indo-Burmese rice agreement of 1956. Some 1,200,000 acres of rice lands destroyed during World War II in the Delta area are being successfully reclaimed for the use of nearly 500,000 villagers. In 1958–59 the acreage planted to sesame (1,362,000) and production (35,000 tons) both were lower than in the previous year, while jute output advanced to 6,000 tons (from 28,790 matured acres). Other chief crops in 1958–59 were peanuts (142,000 tons from 977,000 acres); cotton (11,000 tons from 332,000 acres); sugarcane (1,050,000 tons from 75,000 acres in 1957–58); millet and wheat (81,000 tons from 580,000 acres in 1956–57).

Lumber.—Hardwood production rose in 1958, but teak output (170,222 tons, compared with 216,797 tons in 1957) has not yet caught up with the prewar average. In 1958, the total of other timber production (including green teak, used in the making of veneers) was 519,318 tons—down from 1957.

Minerals.—Production of petroleum (principally at the Chauk and Syriam refineries) in the first half of 1957–58 was 53,018,000 gallons (crude oil), compared with 37,118,000 gallons in the same period of the previous year; of gasoline, 15,123,000 gallons; and of kerosene, 10,015,000. The value of total mineral production, including tungsten, lead, and zinc was 23% lower in 1958 than in 1957.

Manufacturing.—In 1958, milled sugar (39,851 tons, compared with 26,560 tons in 1957) led industrial production. Gains were also recorded in the first half of 1957–58 in cotton yarn (1,933,000 pounds); cigarettes (477,496,000 units); bricks and tiles; and jute and gunny sacks (12 million, 1958 full year). Electricity consumption amounted to 96,580,000 kw.-hr. in the Rangoon area in 1958.

External Trade.—In 1958 both imports and exports (K1,108 million and K882 million, respectively) were below the level of the previous year. Exports of rice and rice products (1,472,000 tons, valued at K652 million) fell 33.5% by volume and 27% by value. Other exports (value in millions) included raw cotton (K17); pulses (K41); raw rubber (K25, a drop of 34.2%); oil cake (K26); timber (K64); and metals and ores (K34). Imports comprised consumer goods (K625,300,000) and capital goods (K483,100,000). The former included (values in millions) fabrics (K69); pharmaceutical products (K32); coal (K28); metal products (K145), and chemical elements and compounds (K10). For the first seven months of fiscal year 1958–59 (October through April) exports totaled K506 million; imports, K540 million (consumer goods, K323 million), the trade deficit being K34 million, compared with a deficit of K247 million in the same period of the previous year.

UPI

During visit to Rangoon on January 8, Yugoslav President Tito (left) converses with Burmese Prime Minister Ne Win.

Principal Events, 1959.—After holding office from Oct. 29, 1958, Gen. Ne Win, Army chief of staff, resigned as prime minister on Feb. 13, 1959, but within two weeks he had been renominated by the Chamber of Deputies and a new cabinet sworn in. Meanwhile the severity of his administration, including measures directed equally against crime, subversion, and corrupt practices, had produced in Burma a political ferment not experienced since independence. Several members of Parliament were reportedly among the more than 200 offenders against official regulations arrested and removed to a newly created prison camp in the Coco Islands, including 106 members (up to March 11) of the Communist-dominated National United Front. In February passive resistance to the government's policy of "oppression" was proposed by U Nu, Gen. Ne Win's predecessor, following the arrest and detention of 62 members of the Anti-Fascist People's Freedom League, including 58 of U Nu's personal following.

Deferred general elections, to be held early in February 1960, were provided for in the current budget. In going before the electorate, the semimilitary regime could point to its successful rounding up of armed Burman Communists (600 surrenders up to March 10, 1959); reprisals taken on the remnants of rebel forces (estimated at 3,600) in Karen State and upon Chinese Nationalist guerrillas on the northeast frontier; the improvement of railway services, including a new overnight express run between Rangoon and Mandalay in the face of attempted guerrilla raids; and large-scale rehabilitation projects in the city of Rangoon. Involved in the latter was the removal, under army direction aided by citizen "sweat brigades," of 170,000 squatters to newly made nearby towns, and the extermination of some 50,000 semiwild dogs. Credited to the army's enforcement of security was the improvement in crime statistics. In the first quarter of 1959 there were 330 homicides, 499 robberies, and 98 kidnapings, compared with 521 homicides, 794 robberies, and 135 kidnapings in the same period of 1958.

Reversing a policy instituted in 1953 against foreign aid in outright gifts, the government agreed in July to receive United States grants of up to $37 million over a four-year period. In 1959, Burma was also to receive $5,733,000 in aid from the International Bank for Reconstruction and Development, $4,879,000 from the Soviet Union in the form of credits, and $483,000 in economic assistance under the Colombo Plan. It was decided to use $2.5 million under the existing $25 million

Burma–United States loan agreement for the foreign exchange cost of 12 new rice mills, to turn out approximately 320,000 tons annually. Dollar loan funds were also to be used for the modernization of 30 to 40 existing rice mills.

BUSINESS DATA, U.S. Number of Business Firms.—More than 4,600,000 separate concerns made up the American business structure in 1959. (The number of farms is comparably large, but farms are not included in the official statistics of the business population summarized in Table 1.)

Table 1—NUMBER OF FIRMS IN OPERATION AND NUMBER OF NEW AND DISCONTINUED BUSINESSES, 1957–59
(Thousands)

	1957	1958	1959[1]
New buinesses formed	405	411[1]	...
Businesses discontinued	341	356[1]	...
Firms in operation, January 1:			
All industries	4,471	4,534	4,589
Contract construction	465	468	476
Manufacturing	332	333	331
Wholesale trade	304	311	317
Retail trade	1,926	1,948	1,956
Service industries	810	830	852
All other	634	644	657

[1] Based on incomplete data. (Source: U.S. Department of Commerce, Office of Business Economics. Estimates based primarily on data from the U.S. Department of Health, Education, and Welfare, Bureau of Old-Age and Survivors Insurance.)

Small firms are greatly in the majority, as evidenced by the fact that three out of four concerns have no more than three paid employees. In the trade, services, and finance sectors the proportion is even higher. The larger firms, however, provide a much more substantial share of all paid employment.

Of every five businesses at least two are likely to be retail stores and one is generally a professional practice or other service enterprise. Contract construction companies account for one in every 9 or 10 concerns, and manufacturing and wholesale distribution each account for approximately one out of 14 firms.

The number of business concerns increased by between 55,000 and 65,000 during 1958 (as it had in 1957), even though a business slump had developed toward the end of 1957 and continued for almost a year. The growth in the number of firms spurted as the nation's economy moved out of the recession, so that by mid-1959 the number of separate concerns had increased 75,000, or almost 2%, from the total of a year earlier.

In 1958 the formation of new businesses was stepped up slightly but did not reach the pace set two years earlier, when 431,000 new concerns were launched. On the other hand, the number of businesses discontinued for one reason or another also rose in 1958. Bankruptcies contributed to the increase, but continued to represent only a minor fraction of the total number. Other causes of discontinuance include the owner's retirement or death and changes in the line of business conducted.

Fixed Capital Investment.—The capital required to carry on a business, like the number of employees, naturally varies a great deal from one line of activity to another (see Table 2). The average corporation in trade or services shows total assets (including accounts receivable as well as physical properties) of around $250,000. If unincorporated ventures were included, the average would be very much smaller. Communications companies average $6 million in total assets, and public utilities, $15 million to $20 million. There are also, of course, wide differences within industries.

Investment in New Plant and Equipment.—The assets indicated in Table 2 have been accumulated year by year, as new investment has exceeded the values lost through sale or scrappage. Purchases of business plant and equipment in 1959 were estimated at somewhat more than $33 billion. Table 3 shows which industries did most of the investing.

Table 3—EXPENDITURES ON NEW PLANT AND EQUIPMENT BY U.S. BUSINESS, 1957–59[1]
(Millions of dollars)

	1957	1958	1959[2]
Manufacturing	15,959	11,433	12,444
Durable	8,022	5,469	6,020
Nondurable	7,937	5,964	6,424
Mining	1,243	941	996
Railroad	1,396	754	1,032
Transportation other than railroad	1,771	1,500	2,024
Public utilities	6,195	6,088	5,840
Commercial and other[3]	10,398	9,810	10,919
Total	36,962	30,526	33,255

[1] Data exclude expenditures of agricultural business and outlays charged to current account. [2] Estimates based on anticipated capital expenditures reported by business in late July and August 1959. [3] Includes communications, trade, service, construction, and finance. (Source: U.S. Department of Commerce, Office of Business Economics, and Securities and Exchange Commission.)

The industry pattern is partly traceable to differences in numbers of firms and in their average capital needs. There are also differences in the pace of capital expansion, and it is interesting to note the effect of technological advance. In nonrail transportation, for example, the 1959 expansion programs exceeded even those of 1957, mainly because of the shift to jet aircraft.

Manufacturing, which accounts for approxi-

Table 2—GROSS ASSETS OF CORPORATIONS, 1956 AND 1957[1,2]

	Number of companies		Total gross assets: Average per company reporting ($ million)		Total gross assets: Total ($ billion)		Gross plant, equipment, and inventories: Gross depreciable assets ($ billion)		Gross plant, equipment, and inventories: Inventories ($ billion)	
	1956	1957	1956	1957	1956	1957	1956	1957	1956	1957
All industries, total	827,916	879,106	1.3	1.3	1,066.8	1,126.1	327.5	356.9	78.7	80.6
Manufacturing	128,457	133,558	2.2	2.2	277.9	292.7	134.2	146.8	49.8	50.4
Durable-goods industries	66,666	70,832	2.0	2.0	134.3	142.8	60.2	66.9	28.7	29.0
Nondurable-goods industries	61,791	62,726	2.3	2.4	143.6	149.9	74.0	79.9	21.0	21.3
Finance	244,755	255,976	2.1	2.1	511.6	536.4	28.8	31.8	0.1	0.1
Transportation	24,963	26,099	2.3	2.2	57.3	58.7	43.9	45.4	1.0	1.0
Public utilities	3,417	3,534	16.9	17.9	57.8	63.2	51.5	56.3	1.2	1.4
Communications	4,515	4,859	6.0	6.1	26.9	29.6	21.8	24.6	0.8	0.7
Trade	270,951	289,377	0.3	0.3	82.3	86.5	20.2	21.5	23.1	24.0
Service	74,372	82,429	0.2	0.2	17.0	19.5	9.1	10.6	0.7	0.8
Construction	45,223	50,425	0.3	0.3	12.0	13.9	3.3	3.9	0.9	1.0
Mining and miscellaneous	31,263	32,849	0.8	0.8	24.2	25.6	14.8	16.0	1.1	1.3

[1] Coverage of these data is not quite complete, but comprises firms accounting for 99% of all corporate sales and operating receipts. [2] Asset values are shown gross of accumulated depreciation, depletion, and amortization. (Source: Based on reports to the U.S. Internal Revenue Service in connection with federal income tax returns.)

mately two fifths of the gross depreciable assets shown in Table 2, also provides a similar fraction of total plant-and-equipment spending. Its fraction of the spending total declined somewhat in 1958 and held about even in 1959. Railroad purchases, down more than usual in 1958, spurted in 1959.

Net Income.—The 1958–59 upswing in general business activity stood out especially clearly in the record of business net incomes. The cash return to equity owners from the nation's corporations showed comparatively little change during the cyclical swing, the companies being in general willing and able to maintain the established dividend rates. Total profits fluctuated widely, however. From an early 1957 high which was equivalent to an annual rate of $44 billion (or one fifth of the total flow of national income from corporate business), before-tax earnings swung down to an early 1958 low of only $31.5 billion, at an annual rate, and then rebounded to an all-time peak rate of $51 billion in the spring of 1959 (Table 5). This high spring rate was due in part to the temporary surge of demand which reflected the stockpiling of steel and steel products in business inventories, in anticipation of the protracted steel strike (see IRON AND STEEL) which began soon after mid-1959. The effects of the strike itself were felt in a sharp decline of profits from the second to the third quarter and, during the final quarter, in shortages of materials caused by the stoppage. Table 4 shows how the business expansion prior to the strike raised corporate profits and, to a somewhat lesser extent, the net earnings of business and professional men from their own enterprises.

Table 4—BUSINESS NET INCOMES, 1958–59
(Billions of dollars)

	Seasonally adjusted at annual rates						
		1958 (Quarter)				1959 (Quarter)	
	1958	I	II	III	IV	I	II
Corporate profits	37.1	32.0	33.6	38.3	44.6	46.5	52.6
Taxes	18.2	15.7	16.5	18.8	21.9	22.6	25.6
After-tax profits	18.9	16.3	17.1	19.5	22.7	23.8	27.0
Dividends	12.4	12.7	12.6	12.6	12.0	12.8	13.0
Income of nonfarm non-corporate enterprises	32.4	31.6	32.0	32.6	33.2	33.7	34.5

(Source: U.S. Department of Commerce, Office of Business Economics.)

Table 5 indicates the industrial pattern of the rise in corporate earnings. From the first quarter of 1959 to the second, the bulk of the advance is seen to have been in profits from steel manufactures and other durable goods. In the third quarter (figures not shown), durables bore the brunt of the earnings decline. Over the longer and more "normal" period of economic expansion from the 1958 low to the opening quarter of 1959, the profits expansion was more evenly distributed among major industries. Here too, however, the cyclically sensitive manufacturing division accounted for a larger proportion of the rise than of the initial total.

Table 5—CORPORATE PROFITS, BEFORE TAX, AND INVENTORY VALUATION ADJUSTMENT, BY BROAD INDUSTRY GROUPS, 1957–59
(Billions of dollars)

	Seasonally adjusted at annual rates						
		1958 (Quarter)				1959 (Quarter)	
	1958	I	II	III	IV	I	II
All industries, total	36.7	31.5	33.8	38.0	43.5	45.5	51.0
Manufacturing	18.7	16.2	16.7	19.1	22.9	24.2	28.6
Durable goods	9.5	7.9	8.2	9.3	12.6	13.0	17.0

All other industries	12.3	10.3	11.7	13.0	14.2	14.7	15.6

(Source: U.S. Department of Commerce, Office of Business Economics.)

The profit, sales, and investment spending totals of such typically large-scale industries as heavy manufacturing and the public utilities are much influenced by the experience of very large companies, such as General Motors and Standard Oil of New Jersey. Table 6 is an unofficial compilation of the sales and profits of such firms—those industrial and trading concerns with 1958 sales of $1 billion or more. Each year a few more companies are added to the list, and an important cause of shifts in rankings is the altering pattern of public demand for the various kinds of products represented.

Table 6—INDUSTRIAL AND TRADING CORPORATIONS WITH SALES OF OVER $1 BILLION, 1958

	Sales ($ billion)	After-tax profits ($ million)
General Motors	$9.5	$634
Standard Oil (N.J.)	7.5	562
Great Atlantic & Pacific Tea	5.1	54
Ford Motor	4.1	96
General Electric	4.1	243
Sears, Roebuck	3.7	166

Cities Service	1.0	45
General Foods	1.0	48

(Source: compilations by the author.)

Comparing 1958 with the more prosperous year 1957, one would expect to find the motors and steel companies giving place to the producers and distributors of more staple products. This was indeed the case. Among the corporations moving up in the ranking by sales were food and petroleum producers and grocery and general merchandise chains. Among those moving down were several of the largest auto manufacturers and steelmakers. Figures for 1959 would, of course, reflect still further shifts.

CADMIUM. Cadmium is obtained as a byproduct of the treatment of other metals, chiefly lead and zinc. According to the U.S. Bureau of Mines, estimated world production for 1958 was 19,850,000 pounds, a decline from the 21,070,000 pounds produced in 1957. The United States supplied 49% of the total in 1958, compared with 50% in 1957. Apparent consumption of primary and secondary cadmium metal declined from 10,999,000 pounds in 1957 to 8,177,000 in 1958. Imports of cadmium metal dropped to 1,002,000 pounds in 1958 from 1,586,000 pounds in 1957. Exports were 580,000 pounds in 1958 (693,000 in 1957). In the first three quarters of 1959, domestic output of primary and secondary cadmium metal was 6,736,156 pounds; general imports were 1,067,620 pounds; and exports of metal and flue dust totaled 694,529 pounds. (See MINERAL PRODUCTION for output by major countries.)

CALIFORNIA. Western coastal state, United States; admitted to the Union, Sept. 9, 1850. The "Golden State" ranks third in area and second in population among the 50 states.

Area and Population.—Area: 158,693 square miles (land, 156,740; inland water, 1,953), divided into 58 counties. Population: (1950) 10,586,223; (est., July 1, 1958) 14,284,000. Urban places with 1950 populations above 20,000 (unless another date is indicated):

[1] Special census, 1952. [2] Special census, 1953. [3] Special census, 1954. [4] Special census, 1955. [5] Special census, 1956. [6] Unofficial estimate, Jan. 1, 1957. [7] Special census, 1957. [8] Special census, 1958. [9] Unofficial estimate, July 26, 1959. [10] Estimate Jan. 1, 1960.

Executive.—Chief state officers in 1959:
Governor: Edmund G. Brown (Democrat)
Lieutenant Governor: Glenn M. Anderson
Secretary of State: Frank M. Jordan
Treasurer: Bert A. Betts
Attorney General: Stanley Mosk
Auditor General: William H. Merrifield
Supt. of Public Instruction: Roy E. Simpson

Constitution and Judiciary.—The present constitution went into effect in 1879. The Supreme Court comprises 7 justices; chief justice in 1959 was Phil S. Gibson.

Legislature.—The California Legislature comprises a 40-member Senate (in 1959, 27 Democrats and 13 Republicans) and an 80-member Assembly (47 Democrats, 32 Republicans, 1 vacancy), which meets in regular session in odd-numbered years commencing on the first Monday after the first day of January, and in budget session in even-numbered years on the first Monday in February. (See below, *Principal Events, 1959.*)

Finance.—In the 1957–58 fiscal year, state revenue of $1,750,909,000 included $1,670,476,000 from state tax sources and $80,433,000 from all other sources. An additional $456,297,348 (not considered as revenue) was received from the federal government. Tax revenue comprised $605,237,617 from a 3% general sales tax, $149,269,337 from individual income taxes, $173,598,817 from corporate income taxes, $302,671,082 from motor fuel taxes, $154,816,610 from licensing, and $365,315,537 from all other state tax sources. Expenditures of $1,914,988,000 consisted of $791,655,378 for education, $304,625,980 for health, welfare, and safety, $439,432,476 for highways, and $379,274,166 for all other purposes. State long-term indebtedness on Aug. 1, 1959, amounted to $1,665,324,000.

Banking.—As of June 10, 1959, the state's 42 national banks had $18,267,456,000 in assets, $8,362,746,000 in demand deposits, and $8,051,246,000 in time deposits. The 92 state banks and their 372 branches (June 30, 1959) had assets of $7,289,871,000, demand deposits of $2,923,790,000, and time deposits of $3,392,346,000.

Education.—School attendance is compulsory between the ages of 8 and 16, inclusive. Operating expenditures for public elementary and secondary schools in the 1957–58 fiscal year totaled $1,100,347,465 ($372.91 per pupil), and income comprised $666,183,347 from local school districts, $524,882,856 from the state, and $23,447,154 from the federal government. Outlays for construction and improvements amounted to $433,426,445. Teachers' salaries (1958–59) averaged $6,020 (high school, $6,403; elementary, $5,710). In the 1958–59 fiscal year the state spent $139,185,530 to operate institutions of higher learning and $137,153,042 for construction and improvements.

CALIFORNIA SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (k-6; k-8)	4,507	65,915	2,061,075[1]
Public junior high (7–9)	275	...[2]	325,363[3]
Public junior-senior high (7–12)	41	...[2]	...
Public senior high (9–12; 10–12)	513	38,093	607,249[4]
Private and parochial elementary and secondary	...	...	318,913
Private junior colleges	...	...	1,412
Public junior colleges	62	4,637	119,619[5]
Teachers colleges	12	4,185[6]	81,030
Colleges and universities	64	...	112,566

[1] Excluding 33,845 special pupils. [2] Included in senior high. [3] Includes 7th to 9th grade pupils in 7-to-12 category. [4] Excluding 303,158 special pupils. [5] Excluding 148,263 special pupils. [6] Including 903 part-time instructors.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal, state, and county funds (excluding institutional costs) totaled $420,753,948, including $247,814,083 for the aged, $131,205,026 for dependent children, and $16,111,595 for the needy blind. A monthly average of 553,490 persons received assistance.

State expenditures for mental health activities totaling $123,124,551 included 4 hospitals for the mentally deficient and epileptic (June 30, 1959, 11,539 patients) and 12 hospitals for the mentally ill (47,553). Adult penal and correctional programs (1957–58) cost $29,278,885, and covered 8 prisons (June 30, 1959, 17,809 inmates) and 22 prison farms and camps (1,379). Youth authority programs cost $12,383,679 and covered (June 30, 1959) 2 reception centers and clinics (596 inmates), 6 training schools (2,102), and 3 forestry camps (252). The Department of Corrections also maintained 2 youth reception guidance centers (153) and 4 other facilities (1,173).

Labor Force.—The state's labor force in July 1959 totaled 6,128,000, including 484,000 agricultural workers. Nonagricultural employment was up to 5,399,000 from 5,168,000 in the previous

July and also above the 5,272,000 average for the 12 intervening months. Of nonfarm employees, 25.1% were in manufacturing, 22.9% in trade, and 16.9% in service industries. Unemployment in July 1959 was down to 245,000 from 357,000 in the previous July. The state paid $251,865,869 in unemployment compensation benefits during the year ending June 30, 1959.

Manufacturing.—In the fourth quarter of 1957 there were 25,668 manufacturing establishments in the state. Employment for the year averaged 1,252,508 persons who received $6,458,073,000 in wages. Value added by manufacture totaled $11,996,657,000, and outlays for new plant and equipment amounted to $866,953,000. Production workers in manufacturing averaged $102.66 for an average workweek of 40.9 hours in August 1959.

MAJOR CALIFORNIA MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.[1] (thousands of dollars)
Transportation equipment	331,264	$1,955,428	$3,201,486
Food and kindred products	159,850	720,452	1,768,455
Fabricated metal products	85,429	421,897	833,263
Nonelectrical machinery	88,016	469,106	779,536
Electrical machinery	76,334	376,363	677,431
Chemicals and products	36,292	196,650	592,942
Printing and publishing	64,322	320,693	570,033
Primary metal industries	48,687	268,265	515,698
Stone, clay, glass products	35,721	171,470	465,755
Lumber and wood products	54,678	259,961	412,530

[1] For definition, see text footnote 1 in the article, *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

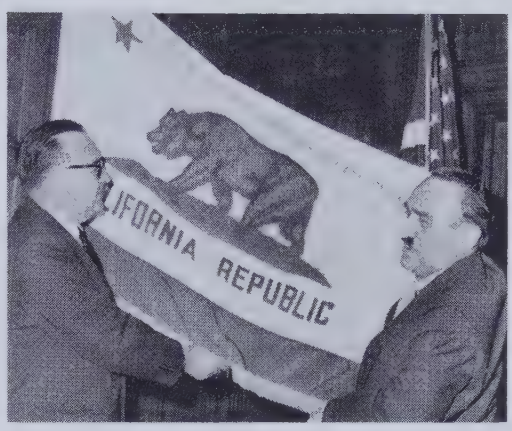
Mining.—California has the most diverse mineral output of any state, and in 1958 it ranked third among the states in the value of its mineral output, accounting for 9.09% of the national total. It produced all of the nation's output of boron and iodine, and was first in its yield of natural calcium chloride, diatomite, gypsum, mercury (59% of national total), sand and gravel, and natural soda; second in cement, chromite, feldspar, potash, pumice, and talc and soapstone; third in ball clay, perlite and pyrites; and fourth in bromine, china clay, gold, molybdenum, peat, and stone.

CALIFORNIA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Boron minerals	528,209	$ 38,310,000
Cement (bbl.)[2]	39,583,000	124,367,000
Chromite	20,588	1,646,000
Clays	2,394,000	5,012,000
Feldspar (long tons)	71,193	624,000
Gold (fine ounces)	185,385	6,489,000
Gypsum	1,423,000	3,184,000
Lime	262,000	4,470,000
Magnesium compounds	74,132	4,854,000
Manganese ore and concentrates	17,644	1,516,000
Mercury (76-pound flasks)	22,365	5,123,000
Natural gas (1,000 cubic feet)[2]	465,582,000	108,481,000
Natural gas liquids (bbl.)	20,310,595	68,485,000
Petroleum (bbl.)[2]	314,429,000	911,844,000
Petroleum gases (bbl.)	8,166,476	18,678,000
Sand and gravel	84,137,000	95,340,000
Stone	32,423,000	48,345,000
Talc and pyrophyllite	148,806	1,439,000
Other minerals	...	71,766,000
Total	...	$1,502,660,000[3]

[1] Excludes masonry cement, value included in "Other minerals." [2] Preliminary. [3] Excludes duplication of clays and stone. (Source: U.S. Bureau of Mines.)

Fisheries.—The commercial fish and shellfish catch in 1958 (including imports by common carriers for processing, and excluding imports to fresh fish markets) amounted to 831,712,903 pounds valued at $77,485,821, a rise from 738,050,743 pounds ($64,980,912) for the 1957 season. Poundages and values of principal 1958 species were: yellowfin tuna (218,075,149; $29,730,515); skipjack (148,158,256; $17,034,768); and albacore (54,673,098; $9,948,122).



WIDE WORLD

Visiting San Francisco on January 11, Soviet Deputy Premier Anastas Mikoyan (right) is attracted by bear on state flag of California, displayed by Governor Edmund Brown.

Agriculture.—Cash farm income for the first nine months of 1959 was up to $1,919,255,000 from $1,869,474,000 recorded for the same period of 1958. For the full year 1958, income comprised $1,088,708,000 from livestock and livestock products, $1,740,755,000 from crops, and $23,329,000 from government payments. Principal income sources in 1958 were: cattle, $405,487,000; dairy products, $348,201,000; cotton lint, $255,785,000; and grapes, $166,479,000.

CALIFORNIA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Almonds (tons)	41,280	19,800	82,000
Apples (1,000 bu.)	8,349	9,650	10,400
Apricots (tons)	190,300	90,000	210,000
Avocados (tons)	25,210	48,300	65,000
Barley (1,000 bu.)	60,693	67,488	68,523
Beans, dry (1,000 bags)	4,270	4,091	3,718
Cherries, sweet (tons)	30,720	12,200	13,500
Cotton lint (1,000 bales)	1,424	1,604	1,920
Cottonseed (1,000 tons)	572	626	771
Dates (tons)	18,094	19,600	22,900
Grapes (tons)	2,680,800	2,741,000	2,950,000
Figs, equiv. fresh basis (tons)	90,550	80,600	63,600
Hay (1,000 tons)	6,168	6,906	6,756
Hops (1,000 lb.)	11,421	9,027	9,338
Lemons (1,000 boxes)	13,669	17,000	18,000
Olives (tons)	47,700	68,000	26,000
Oranges (1,000 boxes)	37,781	40,200	35,000
Peaches (1,000 bu.)	33,152	32,502	28,545
Pears (tons)	355,700	345,000	420,000
Plums (tons)	80,600	61,000	98,000
Potatoes (1,000 cwt.)	26,535[1]	29,598	27,528
Prunes (tons)	160,800	96,000	140,000
Rice (1,000 bags)	10,529	11,080	13,110
Strawberries (1,000 lb.)	142,347[1]	214,200	170,280
Sugar beets (1,000 short tons)	3,364	3,628	4,841

Wheat (1,000 bu.)	10,305	8,162	8,718

[1] Average, 1949–57. (Source: U.S. Department of Agriculture.)

The state Department of Agriculture estimated that there were 131,000 farms in 1958. About 37 million acres, or 37% of the state's entire area is farmland, with more than 8 million acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 3,978,000 cattle, 1,600,000 sheep, and 31,397,000 chickens (excluding commercial broilers). During the week of Oct. 18–24, 1959, there were 663,000 family and hired workers engaged in farming.

Transportation and Communications.—State and federal funds disbursed for highways in the 1957–58 fiscal year totaled $451,076,371, and contracts awarded by the state involved construction work on 1,775 centerline miles.

Highways and roads on Jan. 1, 1959, totaled 141,351 miles (67,268 surfaced). Registered *motor vehicles*

numbered 7,243,336 on June 30, 1959, including 5,791,241 passenger cars. There were (1958) 41 *railroads* operating (1957) 7,513 line miles; and (1959) 18 regularly scheduled *airlines* and 4 supplemental air carriers, and 593 *airports and airfields* (167 commercial and municipal, 44 military, 360 private, 17 federal, 3 state, and 2 district).

Communications media (1958) included 172 AM and 45 FM *radio stations;* 28 *television stations;* 123 daily *newspapers* (circulation, 4,705,000); and (Jan. 1, 1959) 2,103,500 business and 4,722,600 residential *telephones.*

Principal Events, 1959.—After a decade of acrimonious North-South wrangling over the solution of California's water problems, the legislature passed Gov. Edmund (Pat) Brown's first-step, compromise water program, including a proposal for a $1.75 billion bond issue. Approval of the spending plan must come from voters in the 1960 election. The legislation calls for coordinated control and utilization of the state's water resources. Protection of northern water rights in the "counties of origin" against legislative abrogation is implicit in the bill. California's new water plan points toward the expenditure of $11 billion over a period of more than 60 years, but individual projects must be approved by the legislature on a piecemeal basis. It envisions construction of the world's biggest water transport system.

Other newly approved construction activity includes a 12,500-mile statewide freeway and expressway system, to be built over the next 20 years at an estimated cost of $10.5 billion. New freeways eventually will link all cities in the state having a population of 5,000 or more, and new tunnels will be constructed under San Francisco Bay.

California's Democratic-controlled legislature also passed a Brown-sponsored Fair Employment Practices Act and another law which he backed ending cross-filing in state elections.

A period of fiscal reckoning coincided with the advent to power of Governor Brown, who was inaugurated as the state's 32d governor on January 5. Failure to enact necessary new taxes, and temporizing with state finances by falling back on the state's "rainy day" fund, could not go on forever. To meet the state's $2.2 billion budget and to avert a treasury deficit, the legislature in 1959 increased personal income, inheritance, bank, corporation, and beer taxes. Added to a new tax on horse racing and a 3-cent-a-pack tax on cigarettes, these measures provide $222.7 million in additional revenue, or 18.5% more than was anticipated from tax sources existing prior to the increases. Brown had hoped to raise $256 million in new taxes per year. Under the governor's goading, the legislature enacted the biggest spending and taxing program in the history of the state, raising taxes enough to trim a threatened $201 million annual deficit to $5 million. The tax measures which Governor Brown submitted to the legislature corresponded very closely to those which it passed, with the notable refusal of the legislature to adopt a severance tax on oil and gasoline products.

California's population has continued to grow unceasingly. Despite a slight dip in migration into southern California during the 1957–58 recession, that section's population boom proceeded at a pace of nearly 1,000 new persons per day. From April 1, 1950, to July 1, 1959, there was a net increase of 3,190,000 in the state's 14 southern counties, which contain about half of California's population. In the same nine years the entire state's population growth accounted for 18% of the total United States gain. California's population (estimated by the state Department of Finance) stood at 15,280,000 on July 1, 1959.

Business and agricultural activity has generally kept up with population growth. For the first nine months of 1959, cash farm receipts were almost 3% greater than in the comparable period of 1958 (see above, *Agriculture*). California manufacturing establishments had, by mid-1959, generally recovered from the 1957–58 recession, which was milder in the West than in other sections of the country. Several industry groups, such as the missile-electronics industry and the ordnance and electrical machinery complex, increased their number of employees by 20–30% in one year. Aircraft manufacturing employment, approaching 250,000 workers in the third quarter of 1959, was about 3% higher than in the year before.

Unemployment in California in 1959 remained spotty and deceiving. While some workers were thrown out of work by the national steel strike, by cutbacks in military defense expenditures, and by other industrial dislocations, personal income reached an estimated record level of $39,050 million in mid-1959. This was an increase of more than $3 billion, or 8.6%, over a year earlier. Per capita income during 1958 was $2,559, up 0.6% from 1957 and 24% above the national average.

(See also BRIDGES; DAMS; IRON AND STEEL; LOS ANGELES; NEWSPAPERS; SAN FRANCISCO; TUNNELS.)

ANDREW F. ROLLE,
Associate Professor of History, Occidental College; Author, "An American in California."

CAMBODIA. A kingdom of Southeast Asia, situated on the Gulf of Siam and bordered by Vietnam, Laos, and Thailand. Estimated area: 66,606 square miles. The population (est. April 1958) of 4,740,000 consists chiefly of Khmers (Cambodians), but includes about 350,000 Vietnamese and 250,000 Chinese. Khmer is the national language. Phnom Penh (1956 est. pop., 500,000) is the capital and chief city.

Government.—King Norodom Suramarit (acceded 1955) is the sovereign of this constitutional monarchy. The National Assembly has 61 members elected at least every four years. A ministry headed by a premier is responsible to the assembly. Chief political control is held by Prince Norodom Sihanouk, who relinquished the throne to his father in 1955 and founded the Popular Socialist Community. The prince's party won all the assembly seats in the elections of 1955 and 1958; there is no effective political opposition. The prince, who has served as premier several times since 1955, has headed the present cabinet since its investment on July 10, 1958.

Education and Religion.—An estimated 35–40% of the population is literate. In recent years the government has made substantial efforts to expand elementary education. There were 3,162 elementary schools with 416,722 pupils in 1957; 15 secondary schools with 8,991 students; and five technical schools. Cambodia also has two teacher-training colleges, a law faculty, a school of medicine, and a Buddhist university at Phnom Penh. The principal religion is Buddhism; a small minority of Vietnamese and Europeans is Roman Catholic.

Finance.—The 1958 draft budget estimated revenues at 2,433 million riels; and expenditures at 2,650 million riels, of which 657 million was allocated for defense, 809 million for social services, 414 million for investment, and 151 million for economic services. (The riel equals about U.S.$0.029 at the official rate.) United States military and economic aid is important.

Transportation and Communications.—The Mekong River and its tributaries provide an important means of transport; Phnom Penh is the chief port. On July 22, 1959, a 133-mile highway linking Phnom Penh with the new seaport of Sihanoukville (formerly, Kompong Som) was completed; the road cost an estimated $32 million and was constructed with United States aid. There were 1,010 miles of asphalted highways and 677 miles of macadamized roads in 1957. Cambodia's only railway extends 240 miles from Phnom Penh to the Thai border at Poipet. Air service is provided by Royal Air Cambodge, a Cambodian-French enterprise. In 1957 there were 5,700 passenger cars, 4,700 commercial vehicles, 7,000 radios (1956), and 2,818 telephones.

Production.—Cambodia's predominantly agricultural economy is dependent on the small-scale cultivation of rice (the staple of diet) and the production of rubber, a major export. The gross domestic product in 1957 was valued at 15,975 million riels,

of which agriculture, forestry, and fishing contributed 43.7%. Output of paddy in 1958 was estimated at 1.2 million metric tons, or about the same as in 1957. Production of rubber in 1958 was 33,555 tons, up 9% from the previous year. The chief secondary crop and an important export is maize (corn). Sugar production, based on the sugar palm, averages about 40,000 metric tons annually. Other crops are soya beans, peanuts, pepper, kapok, cinnamon, aniseed, essential oils, and tobacco. Cattle breeding is an important source of income. Cambodia's vast forests provide softwood timber, bamboo, and hardwoods.

Industry, of minor but growing importance, contributed 12% of the national output in 1957. Cambodia had a two-year equipment plan (1956–57) and is engaged in a five-year economic development plan (1958–62). Industrial establishments include rubber processing plants, tanneries, an automobile assembly plant, metal fabricating plants, textile mills, and alcohol distilleries. Of major importance are cottage handicrafts producing woven goods, baskets, pottery, leather, and wood products.

Foreign Trade.—The value of exports in 1958 was 1,852 million riels (up 2% over 1957); imports, 2,643 million (up 29%). Rice exports were valued at 775.2 million riels; rubber, 614.4 million; and maize, 224.4 million. Chief imports are textiles, base metals and manufactures, food, machinery, and transport equipment. Cambodia's chief suppliers in 1958 were France, Japan, the United States, Hong Kong, West Germany, and Singapore; principal customers were France, the United States, Singapore, and Hong Kong.

Principal Events, 1959.—Cambodia resumed diplomatic relations with Thailand on February 6, following the good offices of Johan Beck-Friis of Sweden, special representative of U.N. Secretary General Dag Hammarskjöld. Beck-Friis obtained the release of 67 Thai citizens who had been arrested by the Cambodian government, and secured Thailand's promise to release 14 Cambodians who had also been arrested. Relations between the two countries had been severed by Cambodia on Nov. 24, 1958, as a result of border disputes.

The government also re-established trade relations with South Vietnam after a year's rupture. Prince Norodom Sihanouk and President Ngo Dinh Diem of South Vietnam, meeting at Saigon on August 3–4, reached partial agreement on how to deal with Communist rebels using Cambodia as a refuge for raids on South Vietnam. It was reported that Cambodia had agreed to assist the Vietnamese in capturing the rebels, but would not permit Vietnamese troops to invade Cambodia for that purpose.

Early in the year the government put pressure on alleged subversive elements. In February the army deposed the governor of Siemreap Province, Gen. Chhuon Mochulpich, who had virtually ruled part of western Cambodia with the help of his own private army. He was accused of leading a movement to overthrow the present regime, and fled to escape arrest. On October 1 a military tribunal in Phnom Penh sentenced 16 men to death for participation in the antigovernment plot. In January the government ordered the arrest of Sam Sary, former ambassador to London, who had founded the opposition Democratic Union Party and had attacked the regime in a newspaper article. He also was accused of plotting to overthrow the government.

Premier Prince Norodom Sihanouk made a state visit to Indonesia on February 9–14. In return, President Sukarno of Indonesia visited Cambodia on June 20–24.

CAMEROONS. See British Cameroons; French Cameroons.

CANADA. A member of the Commonwealth of Nations, comprising about 40% of continental North America, and consisting of 10 provinces, the Northwest Territories, and the Yukon Territory. The capital is Ottawa (pop., 1956 census, 222,129), in the Province of Ontario.

Area.—With a total area of over 3.8 million square miles, Canada is the second largest country in the world, exceeded only by the Soviet Union. (Area by provinces and territories is shown in Table 1.)

Table 1—AREA OF CANADIAN PROVINCES AND TERRITORIES
(In square miles)

[1] Too small to be enumerated.

Population.—The population of Canada was estimated at 17,442,000 as of June 1, 1959, a rise of 2.3% from the year before and 8.5% from the 1956 census figure (est. pop., Sept. 1, 1959, 17,550,000). Families in Canada were estimated to number 3,953,000 in 1958 (up 6.7% from 1956), with an average size of 3.8 persons. Of the 1959 population, about 32.5% was in the age group under 15 years (up 11.4% over 1956), 60% in the group 15 to 64 years (up 7.2%), and 7.5% in the group 65 years and over (up 5.7%).

Table 2—POPULATION OF CANADA

Province or territory	1951 census	1956 census	1959 (est. June 1)
Newfoundland	361,416	415,074	449,000
Prince Edward Island	98,429	99,285	102,000
Nova Scotia	642,584	694,717	716,000

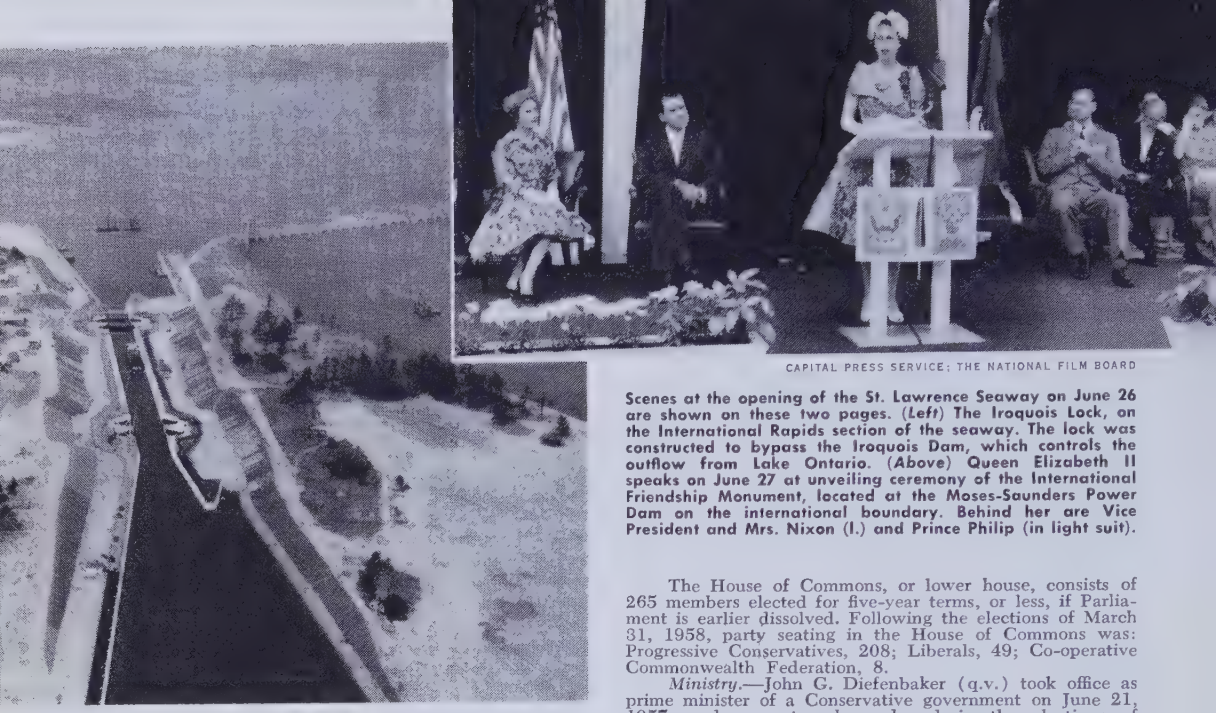
Northwest Territories	16,004	19,313	21,000
Total, Canada	14,009,429	16,080,791	17,442,000

(Source: Dominion Bureau of Statistics.)

Canada's urban population in 1956 comprised 66.6% of the total, as compared with 63.5% in 1951. Of the 1956 total population, about 17.1% (2,746,755 persons) lived on farms. Canada's largest cities and their populations (1956 census) are: Montreal, 1,109,439 (metropolitan area, 1,620,758); Toronto, 667,706 (metropolitan area, 1,358,028); Vancouver, 365,844 (metropolitan area, 665,017); Winnipeg, 255,093; Hamilton, 239,625; Edmonton, 226,002; Ottawa, 222,129; Calgary, 181,780; and Quebec, 170,703.

Vital Statistics.—Canada's birth rate, one of the highest for industrialized countries, was 27.6 in 1958; the death rate, one of the lowest in the world, 7.9; and the infant mortality, 30 (a record low for Canada). Life expectancy at birth in 1951 averaged 66.3 years for males (up 6 years since 1931) and 70.8 for females (up 8.8 years).



CAPITAL PRESS SERVICE; THE NATIONAL FILM BOARD

Scenes at the opening of the St. Lawrence Seaway on June 26 are shown on these two pages. (*Left*) The Iroquois Lock, on the International Rapids section of the seaway. The lock was constructed to bypass the Iroquois Dam, which controls the outflow from Lake Ontario. (*Above*) Queen Elizabeth II speaks on June 27 at unveiling ceremony of the International Friendship Monument, located at the Moses-Saunders Power Dam on the international boundary. Behind her are Vice President and Mrs. Nixon (l.) and Prince Philip (in light suit).

National Derivation.—According to the 1951 census, 85.3% of the population was Canadian born. Canadians of British origin comprised 47.9% of the total population; French, 30.8%; other European, 18.2%; and Asian, 0.5%. The official Indian population (those living on reserves) was estimated at 170,000 in 1958; Eskimos, 11,500; Negroes, 18,020 (1951).

Immigration.—Immigrants entering Canada in 1958 numbered 124,851, less than half the 1957 figure but roughly equal to the 1946–56 average. Of the 1958 total, Italians comprised 22.9%; British, 21.3%; and Germans, 11.6%. In 1958, Canadian citizenship was granted to 84,183 persons formerly owing allegiance to other countries.

Religion.—Adherents of religious denominations according to percentage of total population in 1951 were: Roman Catholic, 43.3%; United Church of Canada, 20.5%; Church of England, 14.7%; Presbyterian, 5.6%; Baptist, 3.7%; Lutheran, 3.2%; Jewish, 1.5%; Ukrainian (Greek) Catholic, 1.4%; Greek Orthodox, 1.2%; Mennonite, 0.9%; other, 4.1%.

Government and Social Welfare

Government.—A member of the Commonwealth of Nations, Canada is a self-governing and fully independent nation. Canada's sovereign is Queen Elizabeth II. The government, based largely on the British constitutional system, is administered by a prime minister and a cabinet of departmental ministers who are members of the Parliament at Ottawa. The cabinet is responsible to the lower chamber, or House of Commons, and holds office as long as it retains the confidence of that body.

Governor General.—Executive power is nominally vested in a governor general appointed by the British crown on the advice of the Canadian cabinet, usually for a term of five years. The governor general, representing the sovereign, acts under the advice of the Canadian ministry. Maj. Gen. George P. Vanier (q.v.) was installed as governor general on Sept. 15, 1959, succeeding Vincent Massey, who had held office since 1952.

Judiciary.—The Supreme Court of Canada, composed of a chief justice and eight puisne judges, is the final court of appeal in both civil and criminal cases throughout Canada. Patrick Kerwin was appointed chief justice on July 1, 1954.

Parliament.—The Canadian Parliament consists of a House of Commons and a Senate. The influence of the Senate on legislation is considerably less than that of the House of Commons, in which most public bills are introduced and to which the ministry is responsible.

The Senate, or upper house, consists of 102 members appointed for life by the governor general on the advice of the ministry. It is composed of 24 senators from Ontario, 24 from Quebec, 10 from Nova Scotia, 10 from New Brunswick, 6 each from Newfoundland, Manitoba, Saskatchewan, Alberta, and British Columbia, and 4 from Prince Edward Island.

The House of Commons, or lower house, consists of 265 members elected for five-year terms, or less, if Parliament is earlier dissolved. Following the elections of March 31, 1958, party seating in the House of Commons was: Progressive Conservatives, 208; Liberals, 49; Co-operative Commonwealth Federation, 8.

Ministry.—John G. Diefenbaker (q.v.) took office as prime minister of a Conservative government on June 21, 1957, and was strongly endorsed in the elections of March 31, 1958. The Canadian Ministry, in order of precedence in the Privy Council, was as follows, as of Jan. 1, 1960:

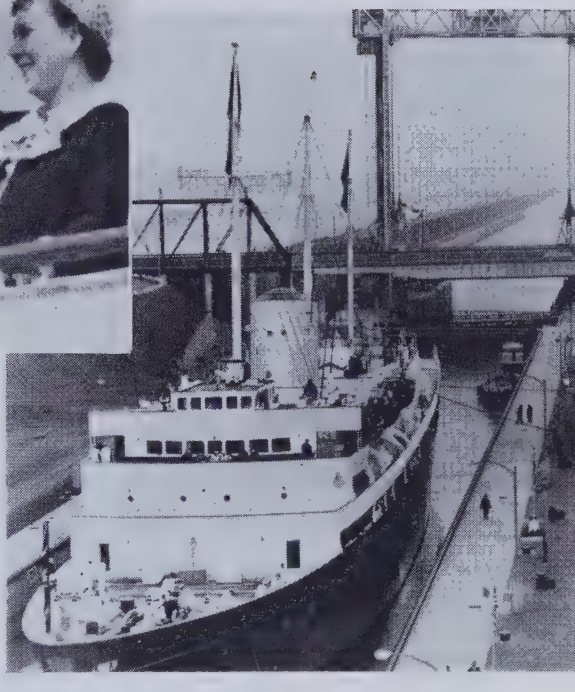
Prime minister—John G. Diefenbaker.
Secretary of state for external affairs—Howard C. Green.
Minister of finance and receiver general—Donald M. Fleming.
Minister of veterans affairs—Alfred J. Brooks.
Minister of transport—George Hees.
Solicitor general—Léon Balcer.
Minister of national defence—George R. Pearkes.
Minister of trade and commerce—Gordon M. Churchill.
Minister of justice and attorney general—Edmund D. Fulton.
Minister of national revenue—George C. Nowlan.
Minister of agriculture—Douglas S. Harkness.
Minister of citizenship and immigration—Ellen L. Fairclough.
Minister of fisheries—J. Angus MacLean.
Minister of labour—Michael Starr.
Postmaster general—William McLean Hamilton.
Minister without portfolio—William J. Browne.
Minister of mines and technical surveys—Paul Comtois.
Minister of national health and welfare—Jay W. Monteith.
Minister of northern affairs and national resources—Francis A. G. Hamilton.
Minister of defence production—Raymond J. M. O'Hurley.
Secretary of state of Canada—Henri Courtemanche.
Minister of public works—David J. Walker.
Associate minister of national defence—Joseph P. A. Sévigny.

Provincial Government.—Each of Canada's 10 provinces has a lieutenant governor appointed by the governor general of Canada, its own premier and executive council or cabinet, and a popularly elected unicameral Legislative Assembly (Quebec alone retains an appointive Legislative Council in addition to its Legislative Assembly). The Northwest Territories and the Yukon Territory are under the jurisdiction of the federal government. (See separate articles on the Canadian provinces and territories.)

Federal Budget.[1]—For the fiscal year ended March 31, 1959 (data for 1957–58 in parentheses) budgetary revenue totaled $4,754.7 million ($5,048.8 million), and expenditure, $5,364.0 million ($5,087.4 million). The 1958–59 deficit of $609.3 million compared with a deficit of $38.6 million in 1957–58. Chief sources of revenue in the 1959 fiscal year were (in millions): personal income tax, $1,353.5; corporate income tax, $1,020.6; ex-

[1] All monetary figures used in this article are in Canadian dollars. In 1958 the monthly average exchange rate of the Canadian dollar was U.S.$1.030; in the first 7 months of 1959, U.S.$1.036.

WIDE WORLD



After ceremonies officially opening the St. Lawrence Seaway on June 26, President and Mrs. Eisenhower joined Queen Elizabeth II and Prince Philip aboard the royal yacht *Britannia* (*right*) and sailed through Côte Ste. Catherine Lock. (Above) President and Mrs. Eisenhower shield their eyes from the sun's glare as they stand on bridge of the royal yacht with the queen and Prince Philip. The seaway, a joint undertaking of the United States and Canada, permits ocean-going vessels to sail into the heart of the continent.

cise (including sales) taxes, $935.1; and customs import duties, $486.5. Expenditure for national defense, defense production, and civil defense aggregated $1,442.4 million. Other major expenditure items were (in millions): public debt charges, $648.0; family allowances, $474.8; subsidies and tax sharing payments to provinces, $467.0; veterans affairs, $288.8; and transport, $288.8. The net public debt as of March 31, 1959, totaled $11,678 million, a rise of $632 million during the year.

The draft budget for the fiscal year 1960, submitted to Parliament on April 9, 1959, forecast revenue at $5,267 million, and expenditure at $5,660 million, for an anticipated deficit of $393 million.

Defense.—As of April 30, 1958, there were 118,877 men and women in Canada's active armed forces. Personnel was divided among the services as follows (with reserves given in parentheses): Canadian Army, 47,289 (41,013); Royal Canadian Navy, 19,919 (4,342); and Royal Canadian Air Force, 51,669 (4,627).

Social Welfare.—The federal government pays a pension of $55 per month to all persons aged 70 or over who have resided in Canada at least 10 years. Old-age pension payments in the fiscal year 1958 amounted to $473.9 million, to over 800,000 persons. Allowances up to $55 per month are paid to needy persons aged 65–69, and to needy blind or disabled persons; this program is administered by the provinces, with the federal government paying up to 50% of the maximum allowance in the case of the needy aged and disabled, and up to 75% in the case of the blind. Under the family allowance program the federal government pays $6 per month for children under 10 years old and $8 for children aged 10–15; family allowance payments totaled $474.8 million in the fiscal year 1959. Canada's unemployment insurance program is administered by the federal government, which also adds one fifth of total employer-employee contributions; benefit payments in 1958 amounted to $492.9 million, up nearly 62% over 1957. Other federal programs include veterans benefits, grants to provincial and municipal health programs, and aid to Indians and Eskimos. (See also CHILD WELFARE; MARRIAGE AND DIVORCE; STANDARDS OF LIVING.)

Education.—Public elementary and secondary schools are administered by the 10 provinces and the Yukon Territory. The federal government is responsible for Indian schools and schools in the Northwest Territories. The Ottawa government also provides university grants, which amounted to about $25.6 million in 1958.

The sharp rise in pupil attendance in the 1950's resulted in the overcrowding of classrooms and other problems. In the school year beginning 1959 an estimated 4 million pupils attended elementary and secondary schools, a 53% increase over the 1950–51 attendance. In the elementary schools, the rise was almost wholly accounted for by the increase in child population. On the secondary level there was both a rise in population and a rise in the percentage attending school (from 51% to 59%). During the period 1950–59 the number of teachers rose by 57%, but an estimated 20% of all teachers in 1955–56 had less than the necessary professional preparation. The median salary for teachers rose from $2,050 in 1950–51, to $3,470 in 1957–58, and the average expenditure per pupil from $142 in 1950 to an estimated $256 in 1959. Full-time university-grade enrollment on Dec. 1, 1958, totaled a record 94,400 students, up 9.1% from a year earlier.

Table 3—CANADIAN EDUCATION STATISTICS
(Data for 1956–57)

Type of School	Schools	Teachers	Pupils
Provincially controlled schools:			
Elementary and secondary	28,884	122,829	3,258,809
Evening	...	...	209,281

Northwest Territories	36	155	3,104
Privately controlled schools:			
Academic[2]	1,212	10,869	151,141
Business training schools[3]	250	554[4]	46,346
Universities and colleges:[5]			
Full-time university grade	283	7,180	78,100[4]
Extension, part-time, etc.	...	7,210	98,300
Total, all types	31,292	151,839	3,945,299

[1] Includes 991 pupils in short courses. [2] Quebec independents included. [3] Day, evening, and correspondence courses. [4] Excludes Quebec. [5] Excluding prematriculation courses.

Libraries.—Public library service is provided mainly by the municipalities. The 870 public libraries in 1957 (including 29 regional and 8 traveling and open-shelf) served 77.3% of the population and had an aggregate book stock of 11,328,188 volumes; a total circulation of 41,939,109; a current operating expenditure of $12,359,-

540; and a full-time staff of 2,067. In addition, there were 624 university and college, federal and provincial government, and professional and technical libraries, with an aggregate book stock of about 12.8 million volumes and a full-time staff numbering 2,532.

The Canadian Economy

Tendencies in 1959.—Recovery from the 1957–58 recession, which had remained somewhat slow and spotty until the end of 1958, gathered momentum in the spring and summer of 1959. By the fall, most major sectors of the economy were at or above prerecession levels, although the condition of the economy could not yet be said to be one of a boom. Strong consumer and government demand, and rising inventory accumulation by business, major forces in the 1958 recovery, continued to exert a buoying effect in 1959. Unemployment in October 1959 was down to 3.8% of the labor force (5.1% in October 1958), and labor income in the January–September period of 1959 was nearly 8% over that of the first 9 months of 1958. Retail trade in the first 10 months of 1959 was about 5% over the 10-month total for 1958, while commodity exports showed a gain of 3%. The index of industrial production, spurred by strong performances in the mining and nondurable goods sectors, as well as the somewhat slow but steady recovery in durables, reached a new record in September. Housing construction, which had been at a peak level in 1958, dropped off in 1959, when starts in the first 9 months declined almost 16% from the like period of 1958. The midyear estimate of capital expenditure in 1959 totaled $8.5 billion, slightly above the $8.4 billion spent in 1958. Farm cash income in the first half of 1959 exceeded the high level of the first half of 1958.

National Income and Product.—In 1958, a year of slow recovery from recession, gross national product rose by less than 1% in volume, although price rises contributed toward an estimated 2.3% rise in value. The slight volume gain—which followed an advance of 9% in 1955, 9% in 1956, and no change in 1957—was attributable to higher output in the agricultural sector, nonfarm production remaining virtually unchanged from 1957. Major factors in the 1958 lull were the heavy inventory liquidation during the first half of the year and the decline in business outlays for new plant and equipment. Opposing these downward trends were the continued growth in consumer and government expenditure and the rise in residential construction.

The average income of nonfarm families and unattached individuals in 1957 was $4,269 (median income: $3,624), a rise of about 11% over 1955 and 34% over 1951. However, taking into account price increases (see Cost of Living), the rise in real income from 1951 to 1957 was about 20%.

Table 4—CANADIAN NATIONAL PRODUCT AND EXPENDITURE
(In millions of dollars)

Item	1956	1957	1958
Gross National Product			
Wages, salaries, and supplementary labor income	14,890	15,996	16,434

Gross national expenditure at market prices	30,585	31,773	32,509

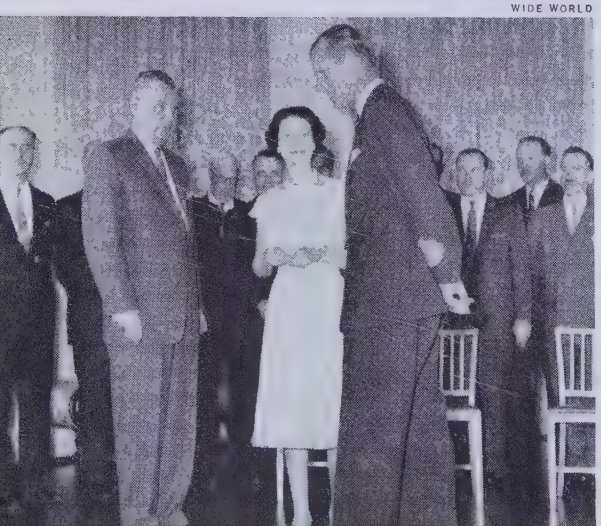
Note: figures are subject to revision. (Source: Dominion Bureau of Statistics.)

Manufacturing.—Manufacturing employs about twice as many persons as agriculture and contributes about 29% of the annual value of goods and services produced in Canada. Ontario, the leading manufacturing province, provides about 50% of output; Quebec, 30%; and British Columbia, 8%. The gross value of factory shipments in 1958 was estimated at $21,655,903,000 (prelim.), down about 2.3% from the record $22,183,594,000 of 1957. Employees in manufacturing numbered 1,359,061 in 1957 (about 23% of the total labor force), and salaries and wages totaled $4,819,628,000. Canada's leading manufacturing industries are pulp and paper, nonferrous metals and products, petroleum products, motor vehicles, foodstuffs, sawmill products, primary iron and steel, and aircraft and parts. The volume index of manufacturing production (1949=100) fell from 142.9 in 1957, to 138.4 in 1958; the decline was in the durables sector, nondurables remaining virtually stationary. Production of some important durables in 1958 was: steel ingots, 4,254,607 tons (down 14% from 1957); pig iron, 3,060,962 (down 18%); passenger cars, 297,088 units (down 12.6%); domestic washing machines, 305,847 units (up 16%); and television sets (producer's sales), about 306,000 (down 8%).

Building and Construction.—The overall value of construction in 1958 was a record $7,231 million, up 3% over 1957. Expenditure on new construction was $5,956 million; on repair, $1,275 million. Of the total expenditure on construction, the out-

In Halifax, Nova Scotia, on August 1, Queen Elizabeth and Prince Philip meet with Canadian Prime Minister John Diefenbaker (at queen's right). At a Privy Council the same day, the queen approved the appointment of Maj. Gen. George P. Vanier as successor to Governor General Vincent Massey.

WIDE WORLD



lay on building construction was $4,099 million, including $2,188 million on residential building, $709 million on commercial, $533 million on institutional, and $391 million on industrial. Residential starts and completions reached record levels in 1958. Starts numbered 164,632 units (up nearly 35% from 1957); completions, 146,686 (up 25%).

Retail Sales.—The value of retail sales in 1958 was a record $15,252 million (prelim.), or 2.9% over 1957. Sales of independent stores amounted to $12,219 million (up 1.9%); of chains, $3,033 million (up 6.7%). Estimated sales of the leading trades in 1958 were (in millions): grocery and combination, $3,094; motor vehicle dealers, $2,391; department stores, $1,342; other food and beverage stores, $1,107; and garages and filling stations, $971.

Labor.—Canada's civilian labor force averaged 6,127,000 in 1958. Of this number a monthly average of 405,000 were without jobs and seeking work (257,000 in 1957). Wages and salaries in manufacturing averaged $72.67 per week ($69.94 in 1957), and the workweek averaged 40.2 hours (40.4 in 1957). Time lost in labor disputes totaled 2,879,100 man-working days, up 76% over 1957. Membership in labor unions at the end of 1958 was about 1,454,000, up 4.9% during the year. About 27% of women of working age were in the labor force in 1958.

Corporate Profits.—Corporate profits before taxes in 1958 totaled $2,904 million (prelim.), down 3.4% from the $3,005 million in 1957; profits after taxes, $1,673 million, down 1.5% from the $1,699 million in 1957. The 1958 decline in profits was in the manufacturing sector, chiefly in industries producing iron and steel products and petroleum and coal products. The nonmanufacturing sector showed a slight gain. Dividend payments in 1958 approximated $758 million, down 4% from 1957.

Banking.—The government-owned Bank of Canada regulates the volume of currency and credit, serves as the government's fiscal agent, and performs other fiscal functions. Canada's 9 privately owned chartered banks had 4,678 branch offices in Canada and abroad at the end of 1958, a rise of 1,268 in 10 years. Total Canadian dollar deposits of chartered banks amounted to $12,664 million as of June 30, 1959 (up 8% over a year earlier), including $7,201 million in personal savings deposits (up 9%). (See also BANKING.)

Agriculture.—Canadian farms numbered 575,015 in 1956 (down 7.7% from 1951); 76.9% were operated by their owners, 6.2% by tenants, 15.8% by part owner and part tenant, and 1.2% by managers. The average size of farms rose from 279.3 acres in 1951 to 302.2 in 1956. Tractors on Canadian farms numbered 499,811 in 1956 (up 25.1% from 1951); grain combines, 136,927 (up 51.3%). In 1956, 73.5% of farms had electric power, as compared with 51.3% in 1951.

Farm Income.—Farm cash income from the sale of farm products in 1958 totaled $2,847 million (prelim.), or 10.5% above the 1957 total of $2,577 million (rev.). Major sources of 1958 income (with 1957 data in parentheses) were (in millions): wheat, $427 ($378); other grains, seeds, and hay, $179 ($208); participation and equalization payments, $68 ($104); other field crops, $258 ($240); livestock, $949 ($784); dairy products, $495 ($460); poultry and eggs, $292 ($277); and all other, $118 ($125). Net income from farming

WIDE WORLD

Queen Elizabeth presents new colors to members of the Royal 22d Regiment. The queen reviewed the troops June 23 on the Plains of Abraham, Quebec City, as part of her tour.

Reviewing troops of the Royal 22d Regiment are Queen Elizabeth, who is colonel-in-chief of the famed French-Canadian regiment; Maj. Gen. George P. Vanier (left), whom she later named as governor general; and Prince Philip (right).

THE NATIONAL FILM BOARD

operations in 1958 was $1.3 billion (prelim.), up 20% from 1957.

Farm Output.—The index of the physical volume of agricultural production (1935–9 = 100) rose from 133.6 in 1957 (rev.) to 139.4 in 1958 (prelim.). Output of livestock and livestock products was chiefly responsible for the 1958 increase, wheat and most other field crops (with the chief exceptions of oats, barley, and flaxseed) showing slight declines. Production of leaf tobacco for the crop year ending Sept. 30, 1959, was an estimated 197.3 million pounds (green weight), up nearly 20%. The 1958 crop of apples, the chief commercial fruit crop, was 17 million bushels. Milk production in 1958 was a record 18.1 billion pounds (up 4.7%); creamery butter, 337 million (up 11%); cheddar cheese, 87.5 million (down 9%); concentrated milk products, 598 million (up 11%); and eggs, 450 million dozen (up 0.7%).

Mineral Production.—Canada leads the non-Communist nations in the production of uranium, nickel, zinc, and asbestos, is second in gold and the platinum metals, and third in iron ore and silver. With the discovery of vast reserves of oil and natural gas in the Midwest, iron ore in Ontario, Quebec, and Labrador, and uranium in Saskatchewan and Ontario, Canada's mineral production rose in value by 240% from 1947 to 1957. In 1958, petroleum maintained its position as Canada's leading mineral, though output dropped about 8.4% from 1957. Uranium jumped to second place, with output more than doubling that of 1957. The total value of mineral production in 1958 was estimated at $2,122.2 million (prelim.), down 3.1% from the record $2,190.3 million of 1957. Ontario, the leading producer, provided 37.7% of the 1958 output value; Quebec, 17.5%; Alberta, 16.0%; and Saskatchewan, 10.1%. (See also IRON AND STEEL.)

Table 6—CANADA'S LEADING MINERALS
(Figures are in thousands; data for 1958 are preliminary.)

Mineral and unit of production	1957 Quantity	1957 Value	1958 Quantity	1958 Value
Asbestos (tons)	1,046.1	$104,489.4	942.1	$ 96,168.0
Cement (tons)	6,049.1	93,167.5	6,069.0	95,869.6
Clay products	...	35,922.2	...	42,611.9

Zinc (lbs.)	827,481.7	100,042.5	857,275.9	93,100.2

(Source: Dominion Bureau of Statistics.)

Forestry.—Canada's vast forests contain an estimated 665,126 million cubic feet of merchantable timber, of which nearly 90% is regarded as accessible to commercial operations. Forest production in 1957 totaled 3,172.2 million cubic feet (down 8.4% from the record 1956 volume), valued at $823.1 million (down 12.4%). Output of leading primary forest products in 1957 (in millions of cubic feet) was: logs and bolts for sawing, 1,553.7; logs for pulping, 108.4; pulpwood, 1,163.9; and fuelwood, 285.1. British Columbia, the leading province in primary forest production, had a 1957 output of $301.8 million; Quebec, $231.9 million; and Ontario, $155.4 million. (See also FORESTRY; LUMBER.)

Fisheries.—Landings of sea fish and shellfish in 1958 totaled 1,851.3 million pounds (prelim.), valued at $101.6 million (up about 25% from 1957). Landings on the Atlantic coast, chiefly lobster, cod, and haddock, had an estimated value of $51.4 million; on the Pacific coast (chiefly salmon, herring, and halibut), $50.2 million (up 66% over 1957).

Furs.—Pelts taken from wildlife and ranch-raised animals in the 1957–58 fur season numbered 6,440,000 (down 7% from 1956–57), valued at $26,335,000 (up 3%). Mink continued as the leading fur, with 1,116,000 pelts valued at $18,345,000; beaver was second with 342,000 pelts valued at $3,572,000.

Hydroelectric Power.—With only about a fourth of its water power resources under utilization, Canada is second only to the United States in total hydroelectric power installation. Canada's capacity turbine installation totaled 22,379,626 hp. at the end of 1958, with net new capacity added during the year amounting to a record 2,485,040 hp. Electrical energy generated from water power (comprising about 93% of total electric power) amounted to 90,247.8 million kw.-hr. in 1958, 8.6% above 1957 output. (See also SAINT LAWRENCE SEAWAY AND POWER PROJECT.)

Foreign Trade.—Reflecting the business recession of 1957–58, Canada's exports remained virtually stationary in 1958 for the second successive year, while imports dropped even more sharply than in 1957. Canada's 1958 exports (including re-exports) totaled $4,928.4 million, or 0.1% below the $4,934.4 million of 1957; imports totaled $5,192.4 million, or 7.7% below the $5,623.4 million of 1957 (1957 imports had been 1.4% below 1956). Total trade in 1958 was reduced by 4.1%, while the fall in imports cut the deficit in commodity ac-

Table 8—DISTRIBUTION OF CANADIAN TRADE BY LEADING COUNTRIES

Country	Calendar Year 1956 ($'000)	1957 ($'000)	1958 ($'000)	% of total (1958)
Exports[1] to:				
United States	2,818,655	2,867,608	2,832,262	58.6
United Kingdom	812,706	737,530	775,896	16.1
West Germany	134,098	151,939	201,863	4.2
Japan	127,870	139,152	104,891	2.2
India	25,714	28,991	79,110	1.6
Imports from:				
United States	4,161,667	3,998,549	3,572,379	68.8
United Kingdom	484,679	521,958	526,650	10.1
Venezuela	208,401	248,145	209,590	4.0
West Germany	89,348	97,646	105,944	2.0
Japan	60,826	61,605	70,216	1.4

[1] Domestic exports (not including re-exports, amounting to $98.1 million in 1958). (Source: Dominion Bureau of Statistics.)

count to $264 million (from $639 million in 1957). Among the outstanding export changes in 1958 were the 116% jump in uranium and the 173% rise in aircraft and parts. Newsprint paper, despite a 4% decline, maintained its leading position, accounting for over 14% of total domestic exports. Import changes included declines of 13% in iron and steel goods, 5% in fibers and textiles, 11% in nonferrous metals, and 12% in nonmetallic minerals, and a rise of 33% in passenger cars.

The United States continued as Canada's leading trading partner, providing 68.8% of Canada's 1958 imports (71.1% in 1957) and taking 59.1% of exports (59.3% in 1957). (See also INTERNATIONAL TRADE.)

Transportation and Communications.—The Trans-Canada Highway, scheduled for completion in 1960, will have a length of 4,480 miles, not including some 390 miles through the Province of Quebec, which has not entered into the federal-provincial Trans-Canada Highway Agreement.

Canada had 423,939 miles of highways and rural roads in 1957, including 231,044 miles of surfaced roads. Of the total surfaced roads, 39,123 miles were of concrete, bituminous pavement, and bituminous surface. Expenditure on roads and highways (including bridges) outside urban areas totaled $701,972,824 in 1957, or 7.4% over 1956. Motor vehicle registrations numbered 4,675,560 in 1958 (5% over 1957), including 3,572,963 passenger car registrations. About 65% of Canadian households had automobiles in 1959.

Railroads.—Canada ranks third behind the United States and the USSR in total railroad mileage. Track mileage in operation in Canada at the end of 1958 was 59,319 route miles (222 miles more than in 1957); first main track, or single track, totaled 44,125. The two major systems, both transcontinental, are the government-owned Canadian National Railways (24,882 miles operated in 1958) and the privately owned Canadian Pacific Railway (17,096).

Commercial Aviation.—The chief scheduled operators are the Trans-Canada Air Lines (owned by the Canadian National Railways) and the Canadian Pacific Air Lines Ltd. (owned by the Canadian Pacific Railway). There are numerous smaller scheduled and nonscheduled lines. An average fleet of 930 aircraft was used by commercial carriers in December 1958 (858 in December 1957). Revenue passengers carried by Canadian carriers rose by 7.9% in 1958 to 4,021,721 (about 2,757,000 carried by Trans-Canada Air Lines). (See also AERONAUTICS.)

Shipping.—Vessels on the Canadian shipping registry (including vessels for inland navigation) numbered 18,294 with a net tonnage of 1,730,139 at the end of 1957. The major share of traffic utilizing Canada's network of canals passes through the Welland Ship Canal, the St. Lawrence River canals, and the Canadian Sault Ste. Marie Canal. Freight locked through Canada's 11 principal canals in the 1958 navigation season totaled 35,096,587 tons, down 5.7% from 1957.

Communications.—In 1959 nearly 81% of Canadian households had telephones, and Canada was third (behind the United States and Sweden) in the proportion of telephones to population. The number of telephones operated by Canada's 15 largest systems (operating 94% of all telephones) was 4,809,568 at the end of 1958 (prelim.), a rise of 6.5% during the year. Close to 75% of Canadian homes have television sets, and 91% of the population is within range of service. As of Jan. 1, 1959, there were 10 Canadian Broadcasting System and 40 private television stations in operation, and 26 CBC and 149 private radio stations. In 1958, Canada had 111 daily newspapers, including 91 in English and 13 in French; total circulation exceeded 4 million. Post offices numbered 11,768 on March 31, 1958. (See also MAGAZINES; NEWSPAPERS.)

(For further references, see the Index entry, *Canada.*)

M. J. G.

THE YEAR 1959 IN CANADA

The year 1959 marked the 200th anniversary of the battle of the Plains of Abraham, which eliminated the power of France in North America. Since this was a victory of English over French, and since the two communal groups, English-speaking and French-speaking, have too often confronted each other in the intervening centuries as "two nations warring in the bosom of a single state," they found some difficulty in celebrating the bicentenary together.

The year was also notable for the royal visit of Her Majesty Queen Elizabeth II and Prince Philip, who came to Canada to preside over the official opening on June 22 of the new St. Lawrence Seaway. Their subsequent continentwide tour produced the expected outpouring of loyal sentiment from Canadians everywhere, though no such spectacular demonstration of enthusiasm as was given on July 6 by the citizens of Chicago; but it left a certain amount of dissatisfaction. What had been announced as an informal visit turned out to be a minutely organized succession of official functions in which the royal guests were overworked. Controversies between Canadian and British newspapers as to how the tour should be managed, and dissensions among different groups of Canadians as to favoritism in the allotment of invitations to special functions left an uneasy impression that Canadians were not showing up at their best in the presence of royalty.

The representative of the queen in Canada, Governor General Vincent Massey, whose term of office had been twice extended, retired in 1959, and was succeeded on September 16 by a French Canadian, Maj. Gen. George P. Vanier (q.v.). The first Canadian to hold the office of governor general, Massey was universally admitted to have set an almost perfect standard in the grace and dignity of his public appearances and in his lively interest in all aspects of Canadian life.

Federal Government.—After the general election of 1958, which gave such a sweeping victory to the Conservative government of Prime Minister John Diefenbaker (q.v.), federal politics in 1959 were comparatively quiet. In December a Conservative Party convention of some 2,000 delegates met in Ottawa. Although the Gallup Poll agreed with private students of politics that the government was no longer so popular as in the victory year, the convention seemed to be without any differences of opinion whatever. It adopted a series of policy resolutions which failed to mention the two topics about which newspaper controversy had been most lively during the year—"tight" money and defense.

As in the United States, there was a collapse in the price of federal government bonds owing to government borrowings which the market seemed unable to absorb. Pressure by the Bank of Canada on the commercial banks to restrict the amount of credit available in order to fight inflationary tendencies, of which government borrowing was one of the chief causes, led to bitter complaints from private would-be borrowers and from provincial and municipal governments. The federal government's denial of any responsibility for the tight-money policy led to somewhat acrimonious discussions in public between it and the commercial banks.

The issue of defense became acute early in the year when the government finally took the step, which had been predetermined in 1958, of canceling (announced Feb. 20, 1959) the contract to build a Canadian supersonic jet plane, the Avro CF-105 Arrow. For the defense of the Arctic approaches to Canada against invasion by plane or missile, the government adopted the United States Bomarc missile in place of the abandoned jet planes—a fact which appeared to make Canada even more dependent on the United States than it had ever been before. Critics became vociferous when it developed that nobody seemed able to explain clearly whether the ultimate control of the atomic warheads in the Bomarc missile would rest with the Canadian or with the United States gov-

ernment. Technological developments were in fact creating confusion in Canadian defense policy as well as in that of all the Western countries. It was charged sarcastically that Canadian defense policy now consisted in spending $2 billion a year on anything that could plausibly be called defense.

Owing to its strict financial policy, the government also ran into other troubles. Increases in civil service salaries were refused by the minister of finance. The demands of the provinces for increased provincial subsidies were also turned down for the time being. And the assistance proposed by the federal government to the prairie wheat farmers, who had had portions of their wheat crop ruined by early snowfalls, was criticized throughout the West as being inadequate.

The 1959–60 budget, presented on April 9 by the minister of finance, Donald Fleming, provided for a general increase in taxation. He estimated for the coming fiscal year an outlay of $5,660 million against receipts of $5,267 million; these figures were based on an estimated gross national product of $34.5 billion, an increase of 7% over 1958. Slight increases were made in personal income, corporation, and sales taxes; duties on fruits and vegetables, and textiles; and excise taxes on cigars, cigarettes, and spirits. Every pocket was hit by these increases, but there seemed no likelihood that the government deficit would be eliminated, and the problem of future government borrowings remained.

Provincial Governments.—In Manitoba the Conservative government of Premier Duff Roblin, which had come into office in 1958 as a minority administration, appealed to the people on May 14 and won 34 seats out of 55, with the Liberals getting 11 and the Co-operative Commonwealth Federation (CCF), 10.

In Ontario, Premier Leslie Frost sought re-election on June 11, and for the sixth time in succession the Conservative Party won the day. Its representation was reduced from 83 seats to 71, the Liberals increased their number of seats from 11 to 22, and the CCF won 5 (formerly, 3); but the Frost government remained securely in office.

In Alberta, on June 18, the Social Credit government sought re-election and received its seventh successive mandate by winning an overwhelming victory—61 out of 65 seats. The leaders of the other three parties (Liberal, Conservative, and CCF) were defeated in their own constituencies. This was the fifth provincial victory won by the Social Credit Party under Premier E. C. Manning. It was the more notable because in the federal election of 1958 the Conservatives under Prime Minister Diefenbaker had swept every seat in Alberta, and Social Credit had been ousted completely from any representation at Ottawa.

In Newfoundland the Liberal premier (the only Liberal provincial premier in Canada), Joseph Smallwood, brought on an election on August 20 in order to obtain popular approval for his drastic action against a strike by the International Woodworkers of America, and to get the voters to endorse his denunciation of the federal government for its refusal to send additional police forces to assist in maintaining order during the strike and for its announcement that the special financial help given to Newfoundland would come to an end in 1962. His return to office with practically the same representation as before meant a strong endorsement from the voters of the province. However, Smallwood's differences with organized labor and with the Diefenbaker government continued.

In British Columbia the Social Credit government intervened vigorously (by getting a wage increase) to bring to an end a long strike in the forestry industry, but it also was responsible for labor legislation limiting picketing and making unions liable to suits for damages—legislation that was denounced by organized labor as viciously reactionary. Thus, in the Atlantic and the Pacific provinces, labor was given grievances that added urgency to the project of the CCF and the Canadian Congress of Labour for launching a new nationwide party of the left in which the trade unions would play a part similar to that which they play in the Labour Party of Great Britain.

Premier Maurice L. Duplessis of Quebec died on September 7. His successor, Paul Sauvé, died suddenly from a heart attack on Jan. 2, 1960, and was in turn succeeded by Antonio Barrette. During Duplessis' tenure, Quebec had stubbornly refused to cooperate with the federal government in a good many fields in which the other provinces cooperated more or less willingly. It refused to give up its right to income taxes and succession duties in return for subsidies from Ottawa. It refused to allow its universities to accept financial help from the Canada Council, as did the universities in other provinces. It remained to be seen whether the new administration would be more flexible in federal-provincial relations.

Canadian Broadcasting Corporation.—During and after the parliamentary session, the most exciting events in Ottawa centered around the Canadian Broadcasting Corporation (CBC). A strike which broke out in Montreal at the end of 1958 as the result of a bitter dispute between the CBC management and the producers of its French programs dragged on for weeks in early 1959 before it was settled. A special committee of the House of Commons carried on an investigation of the CBC which was distinctly hostile in tone. Among other things it discovered that expensive television entertainment programs sponsored by various business enterprises were only partly paid for by the sponsors, who thus got the benefits of advertising which was partly paid for by the taxpayers. In the middle of the investigation, all the producers of discussion programs on the CBC resigned on allegations of improper political interference in this field. The House of Commons committee, dominated by its Conservative majority, took rather extreme pains not to press the investigation of these allegations, since the interference, if there was any, obviously came from the Conservative government.

The government established a new Board of Directors to control the CBC. A new Board of Broadcast Governors was also set up to supervise the broadcasting activities of both the CBC and private broadcasters; its chairman was Andrew Stewart, former president of the University of Alberta. It began by announcing that it was prepared to license private television stations in the main cities where the CBC had hitherto held a monopoly, and by laying down fairly strict rules as to the percentage of Canadian content that would be required on television shows, whether produced by the CBC or by private enterprisers. Evidently the whole future of broadcasting in Canada would depend on the strictness with which the Board of Broadcast Governors enforced standards of quality and content in programs, and on the decisions which the Board of Directors made as to the proportion of CBC programs that should have a mass appeal and so attract sponsors, and those that should appeal to a more select audience.

Royal Commissions.—On the recommendation of the Royal Commission on Energy, headed by Henry Borden, a National Energy Board was set up in 1959 by the government to oversee all activities in this field. In August the Borden Commission made a further report on the oil industry recommending that if the Canadian oil producers in the West could not within a reasonable time

find markets in the United States, a pipeline should be built to Montreal where Canadian oil, in place of overseas oil presently used in Montreal, should be refined for Canadian consumers. This protectionist proposal was not unanimously adopted by the members of the commission. In December the Royal Commission on Price Spreads made a report which was strongly critical of some of the pricing and advertising practices of the big chain-store organizations.

Foreign Affairs.—Canada's external policy came under the direction of a new minister in 1959. Following the sudden death of Sidney Smith on March 17, Prime Minister Diefenbaker appointed on June 4 one of his most trusted associates to the office, Howard Green (q.v.) of British Columbia. Although without experience in this field, Green's frankness and informality during his early months of office helped to make him popular and to give the Conservatives something they could place in the balance against the great international reputation of the Liberal ex-secretary of state for external affairs, Lester Pearson. Secretary Green indicated in his first full report to the House of Commons on July 9 that the government's foreign policy was aimed at lessening world tensions and that Canada would remain firmly aligned with the other Western nations.

Canada continued to consult with the United States on outstanding issues during the year. American and Canadian officials met at Ottawa on January 5–6 to discuss economic problems affecting the two nations, chief of which was the question concerning United States import quotas on Canadian oil. A United States proclamation of March 10 imposing mandatory controls on all oil imports was later rescinded to exempt oil from Canada after the Canadian government had protested strongly against the action. On May 22 the United States and Canada signed an agreement relating to cooperation in atomic energy for purposes of mutual defense. During meetings of the Canada–United States Ministerial Committee on Joint Defense at Camp David, Md., on November 8–9, Secretary Green asked for and received assurances that Canada and other smaller nations within NATO would be consulted more thoroughly in the future in regard to planned East-West negotiations with the Soviet Union. (For details on the prime minister's foreign policy actions during the year, see DIEFENBAKER, JOHN.)

FRANK H. UNDERHILL,
Former Professor of History,
University of Toronto.

CANADIAN LITERATURE. A large and interesting variety of books were published in Canada in 1959; and, in general, Canadian publishers were optimistic about the future, having overcome the uncertainty of the postwar period, the threat of television's incursion into the reading public's time, and the difficulties accompanying rising production costs.

Novels.—A number of worthwhile writers published their first novels during the year, with Phyllis Brett Young and Norma Sluman attracting considerable attention. Miss Young's book, *Psyche,* is filled with amusing and ironic incidents, and Miss Sluman's *Blackfoot Crossing* is excellent fiction about Chief Crowfoot and the Indians of Alberta in 1874. Other first-book novelists of interest were Ronald Hambleton, with his literate and lively *Every Man Is an Island,* and Illia Kiriak, with his intense but gentle *Sons of the Soil.* (Unfortunately, Mr. Kiriak, born in 1888, died in 1958, soon after he wrote this fine study of Ukrainian immigrants in the Canadian West.) Other writers of promise were Sheila Watson, who published *The Double Hook,* a profound, sometimes obscure study of clashing personalities, and Arthur Storey, who brought out *Prairie Harvest,* a rather drawn out but authentic, account of homesteading in Saskatchewan.

An unhappy phenomenon of Canadian letters is the fact that veteran novelists permit extended periods of time to elapse between books. Whatever the cause, this paucity of production is undoubtedly a main factor in the slow development of an aggressive and influential national literature.

Hugh MacLennan is a case in point. His fourth novel, *Each Man's Son,* was published in 1951, but it was not until 1959 that his fifth novel, *The Watch That Ends the Night,* appeared in print. (A collection of MacLennan's essays, *Thirty and Three,* came out in 1955.) MacLennan's latest work is a remarkably penetrating study of life in Montreal during the depression years of the 1930's and later. A memorable novel, *The Watch That Ends the Night* gives ample reason for Canadian critics and readers to yearn for more frequent works from the pen of this refreshing and important writer.

Among other seasoned novelists to bring out books in 1959 were Jeann Beattie, whose *Behold the Hour* affords a keen look at the nervous world of Toronto television, and is even better than her first novel, *Blaze of Noon* (1950); Jan Hilliard, who provides a delightful escape story in *Dove Cottage;* Nan Shipley, who, in *The Scarlet Lily,* recapitulates Canadian development, especially in the West, by tracing the fortunes and misfortunes of her heroine, Ellen Nash; and John Cornish, whose *Olga* is a boisterous account of eccentrics (including members of a religious sect not unlike the Doukhobors) in an Anglo-Slavic village in British Columbia.

Poetry.—A collection, *Recent Canadian Verse,* edited by Milton Wilson, is worthy of note because it indicates the trends among modern Canadian poets. Books of verse by individual poets include R. Cynewulf Robbins' *Out of Solitude* (bold, direct, realistic); George Johnston's *The Cruising Auk* (light but sharp); Verna Loveday Harden's *In the Mind Carrying* (traditional but beautifully worded); and Ronald Bates' *The Wandering World* (unique and exciting). An interesting publication of the year was *Anerca,* a collection of Eskimo poetry edited by Edmund Carpenter. *River and Realm* by Theresa E. and Don W. Thompson was characterized by one critic as the "Seaway in Verse."

Memoirs and Biography.—For so young a country, with so small a population, Canada continues to produce an astonishing number of people who feel they have a story of special interest to tell. Among the more interesting memoirs published in 1959 are *Farmer Citizen,* in which W. C. Wood reports on his 50 years in the Canadian farmers' movements; *Small Patients: The Autobiography of a Children's Doctor* by Alton Goldbloom; and *Days of Living* (ed. by Jackson Pollick), Martin Roher's inspiring report of his ten-year confinement to a hospital bed. Also published were *I Would Do It Again* by Robert E. Campbell, a former schoolteacher and member of the Alberta legislature; *I Was No Lady* by Jean W. Godsell, wife of a former Hudson's Bay Company employee in northern Canada; *Making Your Living Is Fun,* by Kate Aitken, veteran radio broadcaster; and *Something Always Turns Up* by Bluebell Stewart Phillips, wife of an Anglican minister in Quebec.

Of considerable historical value is *The Memoirs of Sir Joseph Pope.* Sir Joseph, who lived from 1854 to 1926, served from 1882 to 1891 as private secretary to Sir John A. Macdonald and from 1909 to 1926 as undersecretary of state for external af-

fairs. The subject himself contributed the memoirs from 1881 to 1907; his son, Maurice Arthur Pope, competently reported on the years subsequent to 1907.

Biography covered a wide range of subjects. W. J. Eccles published *Frontenac, the Courtier Governor;* Michael Brecher, *Nehru: A Political Biography.* Alden Hatch contributed *The Miracle of the Mountain: The Story of Brother André and St. Joseph's Shrine on Mount Royal;* Iris Noble, *The Doctor Who Dared: William Osler;* I. E. Levine, *The Discoverer of Insulin: Dr. Frederick G. Banting;* and Kenneth McNaught, *A Prophet in Politics: A Biography of J. S. Woodsworth.* Leslie Ruth Howard's *A Quite Remarkable Father* is a daughter's view of her late actor-father, Leslie Howard.

An interesting feature of the year was the number of multiple-subject biographies. These included Peter C. Newman's *Flame of Power,* a study of 11 Canadian millionaires; Margaret Mason Shaw's *Geologists and Prospectors: Tyrell, Camsell, Cross, LaBine;* and John Walter Grant MacEwan's *Fifty Mighty Men,* the story of Canadians who developed the West.

Other Nonfiction.—The flow of regional books continued unabated in 1959. Among these were Kenneth McNeill Wells' *Cruising the Trent-Severn Waterway;* Lex Schrag's *Crater Country,* an account of an expedition in 1958 to the meteor crater in Ungava; Andrew Hill Clark's *Three Centuries and the Island: A Historic Geography of Settlement and Agriculture in Prince Edward Island;* and E. C. Drury's *All for a Beaver Hat: A History of Early Simcoe County.*

There were a number of books about Canadian aviation and aviators. Eugenie Louise Myles, in *Airborne from Edmonton,* discusses the development of aviation in Edmonton after World War I. *There Shall Be Wings: A History of the Royal Canadian Air Force* was Leslie Roberts' contribution to this category. *In Canadian Skies,* which one critic described as "50 years of adventure and progress in the air above Canada," was written by Frank H. Ellis; and *The Silver Dart: The Authentic Story of the Hon. J. A. D. McCurdy, Canada's First Pilot,* by Henry Gordon Green.

The newly opened St. Lawrence Seaway received ample coverage during the year. Lionel Chevrier, first president of the Canadian Seaway Authority, discusses the building of the great water route in *The St. Lawrence Seaway.* In another book with the same title, T. L. Hills gives the background and economic consequences of the project. F. J. Bullock, in *Ships and the Seaway* treats the waterway from a seaman's point of view. Relative to the subject is *The St. Lawrence,* William Toye's discussion of the river itself.

Historical works published in 1959 included *The Story of Canada* by Donald Creighton, Canadian editor for The Encyclopedia Americana; *Quebec 1759* by C. P. Stacey; and *The Plains of Abraham* by Brian Connell. Current history and public affairs were represented by Edgar Wardwell McInnis' *The Atlantic Triangle and the Cold War,* George Edward Gordon Catlin's *The Atlantic Community,* and Miriam Chapin's *Contemporary Canada.*

Books by two Canadian statesmen also appeared. Vincent Massey, in the eloquent and witty *Speaking of Canada,* brings together 44 speeches he delivered between 1952 and 1959, when he was serving as governor-general. Lester B. Pearson offered *Diplomacy in the Nuclear Age,* which is based on a series of his lectures given in 1958.

Children's Books.—Books for very young readers, a recent innovation by writers of children's literature, included Winnifred Edwards' *The Money Tree, and Other Stories,* James McNeill's *The Sunken City, and Other Tales from Around the World,* and Lucille Chaplan's *Elephant for Rent.* The early teenage group could choose from Frances Fraser's *The Bear Who Stole the Chinook* (Indian legends); Audrey McKim's *Andy and the Gopher* (an Alberta lad's adventures with a gopher that has an Irish brogue); and Ragnhildur Guttormsson's *Ian of Red River* (Scottish immigrants of the area where Winnipeg now stands). Older teenagers were offered Robert D. Ferguson's *Man from St. Malo,* about Jacques Cartier; Fred Swayze's *Frontenac and the Iroquois;* Edward Alexander McCourt's *Revolt in the West: The Story of the Riel Rebellion* (published in 1958); and John Norman Harris' *Knights of the Air: Canadian Aces of World War II.* General histories of Canada were provided by Lyn Harrington's *Real Book About Canada* and Donalda Dickie's *My First History of Canada.*

Former National Secretary,
Canadian Authors Association.

French-Canadian Literature

Some twenty years ago French-Canadian literature broke away from the pastoral, religious, and patriotic patterns to which it had seemed chained from the beginning. Since then it has never looked back. The net result is that French Canada's contribution to North American literature has become increasingly varied and important.

Fiction.—The best novels of 1959 and late 1958 are by two well-known authors. Yves Thériault, the author of several novels and short stories, sets his latest and best novel, *Agaguk,* among the Eskimos in the barren lands of northern Quebec. Written in the best Flaubert tradition, its unrelenting realism achieves a vivid portrayal of Eskimo life and psychology. Anne Hébert, whose poems and short stories had already won her wide acclaim, has now brought out a novel, *Les chambres de bois,* which was an immediate success. Its poetic prose readily falls into symbolistic patterns that stress human solitude, a theme that increasingly haunts contemporary French-Canadian writers.

There are several other recent novels worthy of mention. In *Les sentiers de la nuit,* Jean Simard, the author of three previous novels, unfolds the somber and bitter failure of a disillusioned bank employee living in Montreal. *Carrefour des hasards,* René Chicoine's first novel, is also a story of failure —the failure of a bright young man overcome by sickness, frustration, and solitude. *L'anse aux brumes,* by Maurice Gagnon, attempts to blend the weird and the real. *L'aube de la joie,* by Anne Marie, deals with the prosaic life of a housewife. Robert Choquette's characters in *Elise Velder* got their start in radio and on television. *Les angoisses et les tourments* is Léo-Paul Desrosiers' 13th novel but not his best one. André Giroux, with two good novels to his credit, turns to the short story form in *Malgré tout, la joie,* but, despite the title, sadness and pessimism rather than joy dominate these stories.

Poetry.—Much of the poetry now being written in French Canada comes from young and enthusiastic poets eager to experiment. *Il fait clair de glaise,* by Maurice Beaulieu; *Poèmes de l'Amérique étrangère,* by Michel Van Schendel; *A la pointe des yeux,* by Alain Marceau; *Les archipels signalés,* by Jean-René Major; and *Les pavés secs,* by Jacques Godbout, are attempts by young poets who are trying out their wings and who are generally preoccupied with the problems of man's existence. Fernand Ouellette in *Séquences de l'aile,* and Michèle Lalonde in *Geôles* and *Songe de la fiancée détruite,* a dramatic poem, show considerable promise.

Nonfiction.—There were few essays published in 1959. *Foi et littérature,* by Pierre Angers, S.J., brings together several articles and symposia where the main concern lies with the literary critic's responsibilities. *L'homme et l'hiver au Canada,* by Pierre Deffontaine, though primarily concerned with things geographical, also offers a greater understanding of the Canadian people and of its literature.

Albert Le Grand,
Associate Professor of French,
Queen's University, Kingston, Ontario.

CANAL ZONE. See Panama Canal.

CANALS. St. Lawrence Seaway.—Canals that bypass power dams on the St. Lawrence River, and the modernized Welland Canal bypassing Niagara Falls were dedicated as completed works of the St. Lawrence Seaway on June 26. Queen Elizabeth II of Great Britain and President Dwight D. Eisenhower participated in the dedicatory exercises. (See also Saint Lawrence Seaway and Power Project.)

Ohio River.—Modernization of the fully canalized Ohio River continued throughout 1959 and still had many years to go. The 981-mile river has many outmoded locks and dams from Pittsburgh

to Cairo, Ill., where the Ohio joins the Mississippi. These must be replaced by fewer, higher structures as the navigable channels of the river are deepened from 9 to 12 feet. Sixteen new structures will replace 41 of 46 old locks and dams, and those not replaced will be improved to afford locks 1,200 feet long and 110 feet wide. Construction of new facilities continued in 1959 at Markland, Greenup, New Cumberland, and New Richmond locks and dams. Improvements were under way on existing Lock 41.

Tennessee River.—A bottleneck was removed in 1959 from the heavily trafficked Tennessee River, which is canalized as far as Chattanooga, Tenn. The Tennessee Valley Authority (q.v.) constructed and, on November 10, dedicated a major lock with a 100-foot lift to replace old locks at Wilson Dam, Muscle Shoals, Ala. The $38 million project involved cutting almost three miles of new canal, and the whole construction operation had to be performed without disruption to the heavy barge traffic.

Panama Canal.—Gaillard Cut is to be widened 200 feet through about two miles of its seven-mile length. The new width of 500 feet is expected to increase traffic capacity of the canal. (See also PANAMA CANAL.)

Suez Canal.—Widening and deepening operations continued on the Suez Canal. Throughout much of 1959 the *Essayons*, world's largest hopper dredge, was leased to the Suez Canal Authority by the U.S. Corps of Engineers for deepening the Mediterranean approaches. (See also SUEZ CANAL.)

China.—Communist China was in 1959 reportedly rebuilding the 2,400-year-old Grand Canal, which extends 1,056 miles from Peking southeast to Hangchow on the East China Sea. The ancient waterway, begun in the 5th century B.C., was extended, improved, and finally completed in 1414 A.D. It has needed thorough rebuilding for approximately a century.

Senior Staff Editor, "Engineering News-Record."

CANARY ISLANDS. A group of mountainous islands in the Atlantic off the coast of Spanish Sahara, comprising two Spanish provinces: Las Palmas and Santa Cruz de Tenerife. Area, 2,808 square miles; pop. (Jan. 1, 1957), 866,078. The seaports of Las Palmas (169,467) and Santa Cruz de Tenerife (114,831) are the provincial capitals. Farming, fishing, oil refining, bunkering, and tourism are the chief sources of income.

CANCER. The magnitude of the research effort in cancer is increasing, stimulated in large part by public demand for more effective cancer control methods. During the fiscal year 1959, the U.S. Congress appropriation for the National Cancer Institute was increased by $20 million to $75,268,000; and the American Cancer Society, with a total budget of about $34 million, allocated over $10 million for research. Altogether, nearly $100 million was spent by the United States on cancer research in 1959 (*Chemical and Engineering News*, Oct. 12, 1959). This compares with about $60 million allocated in 1958.

Incidence.—With the decrease in infectious diseases and nutritional deficiencies as causes of death, the death rate from cancer is rising throughout the world. In 1959 it was estimated that 450,000 people in the United States would develop cancer; 150,000 of these would be cured by modern methods of treatment, and 75,000 would die needlessly because they did not receive proper treatment promptly. The overall incidence of cancer deaths in men exceeds that in women by a ratio of 1.25:1, but the disease is more common in women (due largely to the incidence of breast cancer) in a ratio of 1.5:1 during the ages of 35–44.

Cancer Research.—The relationship between cigarette smoking and the increasing incidence of lung cancer continues to be supported by statistical studies. Despite these facts, the use of cigarettes is increasing in the United States. In a recent study among high school students in Portland, Oreg., it was found that 35% of the boys and 26% of the girls in the senior class were regular smokers.

The incidence of leukemia has approximately doubled in the past 20 years, but the annual rate is approaching a plateau. Exposure to radiation as a cause of cancer (including leukemia) is under close scrutiny; evidence is accumulating that X-ray therapy to the neck region in children is a cause of thyroid cancer, and the use of large doses of radioactive iodine for therapeutic purposes has been associated with the development of acute leukemia.

The American Cancer Society is organizing a 5-year cancer-prevention study, beginning in 1960, in which 70,000 volunteers will accumulate data on the family background and living habits of more than 500,000 American families. It is hoped that this survey may lead to suggestions as to the causative factors in certain forms of cancer.

Viruses continue to be under intensive study as a cause of human cancer. The polyoma virus, described by Sarah E. Stewart and Bernice E. Eddy, has been found to cause a variety of tumors in mice, rats, and hamsters when injected early in life. The observation that the virus will produce tumors in several different species is of the utmost significance. Several investigators have induced tumors or leukemia in mice by injecting extracts or isolated substances from human cancers. The significance of these findings is unclear, since the tumors do not occur consistently and since mice are unusually susceptible test animals; also, a variety of unrelated procedures will induce tumors. Nevertheless, the trend of these studies suggests that noncellular substances obtained from human tissues can induce tumors in mice. Ludwik Gross has observed that cell-free extracts of leukemia, induced by radiation in low-leukemia strains of mice, will produce the disease when injected into young animals of the same strain.

Clinical Results.—The Cancer Chemotherapy National Service Center is now coordinating the screening of about 40,000 substances every year for inhibitory activity against animal tumors. A major portion of this program is concerned with the testing of antibiotics obtained from filtrates of various microorganisms. A filtrate active against animal cancer is purified to obtain the active ingredient, and then is prepared in quantity and tested in various forms of human cancer.

A new alkylating agent, cyclophosphamide (Endoxan, Cytoxan) developed in Germany, was under clinical trial in the United States in 1959. It appears to have the same range of therapeutic activity as the numerous other nitrogen mustard analogues already available. Many fluorinated pyrimidines are being evaluated in human cancer; 5-fluorouracil and 5-fluorodeoxyuridine have been studied most extensively. They appear to have brief and irregular therapeutic activity in the range of the toxic dose, and temporary improvement has been observed in large bowel and breast cancer and in hepatomas.

Robert D. Sullivan has reported on a new approach to the chemotherapy of cancer of the oral cavity. An antimetabolite, amethopterin, was given by constant infusion into the arterial supply to the cancer, and a protective substance, citrovorum factor, was given intramuscularly in order to prevent the systemic toxicity of the drug. The high constant concentration of amethopterin in the tumor-bearing area has produced clear-cut destruction of the cancer in a few cases without serious systemic toxicity. This technique may prove to be useful in treating cancers in other areas of the body.

Drs. John B. Graham and Ruth M. Graham have attempted to enhance a hypothetical host defense against tumor growth by injection of suspensions of the patient's cancer cells in Freund's adjuvant. It is hoped that the tis-

sues will serve as an antigen and that antibodies will be produced against the cancer. The clinical results reported thus far do not indicate that the treatment is particularly useful.

If successful organ transplantation could be accomplished, the surgical approach to cancer would be greatly expanded. Recent work has suggested that acquired tolerance to specific homografts may be produced by certain chemicals. If this work is confirmed and extended, it would represent a major advance.

On the basis of work in mice, it was hoped that patients with acute leukemia could be given total body X-ray treatment in the lethal dose range to destroy the leukemic cells, and then normal bone marrow from another individual could be injected to replace that destroyed by the X-rays. In France, Georges Mathé gave total body irradiation in the lethal range (800–900 roentgens) to six children with acute leukemia, but in remission from the disease, and then injected homologous bone marrow. He obtained evidence of successful bone marrow acceptance in four cases, with suggestive evidence of "immune disease" from the foreign bone marrow, but the disease eventually recurred.

Necrology.—Jesse P. Greenstein (b. 1902), author of a classical work, *Biochemistry of Cancer* (2d ed. 1954), and chief of the biochemistry laboratory of the National Cancer Institute, died on Feb. 12, 1959. Cornelius P. Rhoads (b. 1898), director of the Sloan-Kettering Institute for Cancer Research and scientific director of the Memorial Center for Cancer and Allied Diseases, died on Aug. 13, 1959. Dr. Rhoads was one of the pioneers in the modern era of cancer research and the leading proponent of the chemotherapeutic attack on cancer.

Sloan-Kettering Institute for Cancer Research, New York City.

CANDY. See CONFECTIONERY.

CANNING INDUSTRY. The total of canned goods produced by the industry during 1958 was slightly higher than in 1957, although there were decreases in the output of some individual products, mainly because of poorer crop yields. While the consumption of tomato products remained much the same during the two years, production in 1958 was 25% higher than in 1957, when the crop was very small.

If there were a fixed yearly supply of a perishable succulent food, an 18-month shelf (or storage) life for the canned product would be sufficient to insure its availability. Because of crop and other variations, however, a shelf life of three years is considered necessary. While the canning process provides this life, improvements are needed in the areas of flavor and color.

Green vegetables present the most serious problem in color preservation. The Blair process, which alkalinizes peas with calcium and magnesium oxides, yields peas of a bright green, but in a relatively short period of normal storage, the color reverts to the usual olive green.

The flavor problem is most serious in evaporated milk, which can be canned with little if any of the usual objectionable flavor but soon develops it during storage at normal temperatures.

The process of freezing canned concentrated orange juice was developed with the idea that the juice would not need to be subjected to heat. It was soon found, however, that inactivation of the quality-damaging enzymes required as much heat as in canning unconcentrated orange juice, in which all the essences are retained, and which, if kept under cold storage, would be a superior product.

New processes have been developed to sterilize certain vegetables very quickly and at very high temperatures without affecting the flavor, as the normal process does. Some enzymes survive, however, and still cause deterioration of flavor during normal storage.

There is evidence that greater use of cold storage may help achieve improvements in preserving flavor and color, as there is a direct relation between the lowering of temperature and the slowing of the molecular activity that causes the damage in these areas. (See also X-RAY.)

EDWARD F. KOHMAN,
Research Chemist and Consultant.

U.S. PRODUCTION OF CANNED FRUITS AND VEGETABLES, 1957–58

Product	Number of cases 1957	1958
Fruits and Fruit Juices:		
Apples[2]	3,688,185	3,639,132
Apple juice	4,652,718	5,346,198
Apple sauce[2]	14,006,339	16,002,901
Apricots	5,119,747	2,344,473
Blackberries	490,454	592,182
Blueberries	730,112	561,076
Boysenberries and youngberries	334,712	360,930

CAPE VERDE ISLANDS. See PORTUGUESE TERRITORIES.

CARIBBEAN COMMISSION. Established in 1946 by the United States, France, the United Kingdom, and the Netherlands, this organization initiates projects in the Caribbean areas of member governments and acts as an advisory body on problems of agriculture, communications, cooperatives, education, fisheries, health, housing, industry, tourism, and trade. Its headquarters are at Port of Spain, Trinidad. Associated with the commission is the West Indian Conference, composed of delegates from the countries served. Activities of the commission in 1959 included a conference

of information officers, held in Surinam in March; a conference on the financing of agriculture, held in Trinidad in April; and the 3d Caribbean Fisheries Seminar, held in St. Martin (Sint Maarten), Netherlands Antilles, in July.

Because of the increasing autonomy of many political units in the area, revision of the Caribbean Commission agreement was undertaken at meetings held at St. Thomas, Virgin Islands of the United States, during July and August 1959. At this time, plans were laid for a successor organization, to be known as the Caribbean Organization, with headquarters at San Juan, Puerto Rico. A budget of $316,000 was decided on by the prospective members; these include France (for the overseas departments of French Guiana, Guadeloupe, and Martinique); the Netherlands Antilles; Surinam; British Guiana; The West Indies federation; Puerto Rico; and the Virgin Islands of the United States. British Honduras, the Bahamas, and the British Virgin Islands also are eligible for membership. It was anticipated, subject to appropriate constitutional steps being taken by each of the member metropolitan governments, that the commission would be replaced by the Caribbean Organization late in 1960 or early in 1961; the transfer to new headquarters was to occur early in 1960.

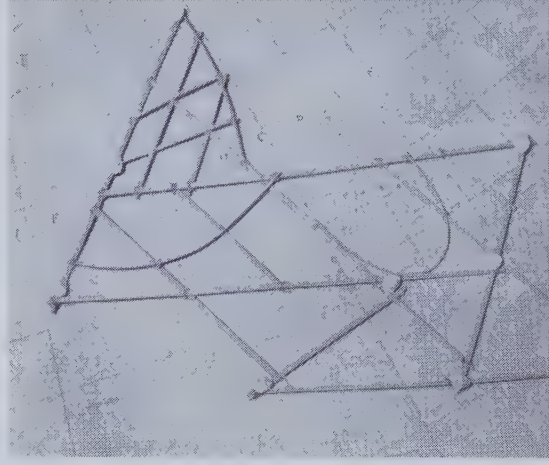
CARTOGRAPHY. Accelerated mapping of the United States, mapping programs in undeveloped areas in other countries, and new emphasis on the polar regions highlighted cartographic activities in 1959.

Mapping the United States.—The Geological Survey (q.v.) published 1,700 new topographic quadrangles during 1959, and also collaborated with the Tennessee Valley Authority in publishing 50 maps of areas in the TVA watershed. The Forest Service published new maps of about 40,000 square miles of national forest units. The Mississippi River Commission accelerated its program of producing aerial mosaics of various areas in the Mississippi River basin. Four large-scale city area maps, significant in civil defense planning, were added to the Geological Survey series. The Weather Bureau has introduced a new series of jet-age weather charts which are transmitted by facsimile circuit to major airports throughout the country. The Soil Conservation Service added 35 county units to the new series of soil maps employing a photo-mosaic base. The granting of statehood to Alaska and Hawaii has added over 150 sheets to the Army Map Service series of medium-scale maps of the United States, bringing the total number of sheets to 620. The series was about 80 per cent complete at the end of 1959.

Antarctic Mapping.—Long-range plans have been made by the Department of the Interior for mapping the Antarctic continent. Under the auspices of the National Academy of Sciences, a plan for Antarctic mapping was submitted at the third meeting of the Special Committee on Antarctic Research (SCAR) in Australia in 1959. The American Geographical Society's 4-sheet map of Antarctica was revised periodically during the year to incorporate new data, and a new reduced-size edition was printed in one sheet at the scale of 1:6,000,000.

World Mapping.—World isogonic charts for the 1960 epoch have been completed by the Coast and Geodetic Survey (q.v.) for publication by the U.S. Navy early in 1960. Seven new sheets were added in 1959 to the World Atlas Series of the



U.S. COAST AND GEODETIC SURVEY

This Polynesian stick chart, superimposed on a modern sailing chart of a section of the Pacific, has been found to be highly accurate. Devised by the South Sea islanders to aid them in navigation, the stick chart consists of a framework of wood, with shells strung at various crossings to represent islands. Strings may be stretched over frame to depict trade winds and waves at right angles to the wind.

National Geographic Society (q.v.), bringing the total number of sheets to 14; the atlas will ultimately include 60 maps. The collaborative mapping program in 17 Latin American republics was accelerated during 1959 by the Inter-American Geodetic Survey. In Mexico, necessary field work was completed for the production of medium-scale maps between the United States border and the 24th parallel. The American Geographical Society's 5-sheet Map of the Americas is being augmented by 4 additional sheets covering Europe, Africa, and the Near East, to be distributed in 1960. Five more are in preparation, covering all of Asia and Indonesia on the same type of format. The Arabian Peninsula is being mapped by the Geological Survey in collaboration with the Saudi Arabian government. The Army Map Service is engaged in a cooperative program to map the world, at a scale of 1:1,000,000, in about 950 map sheets.

Navigation Maps and Charts.—Yachtsmen and small-boat operators of the United States have been provided with an entirely new type of small-craft chart by the Coast and Geodetic Survey. The first of the series, covering the Potomac River, has been published, and other areas will be programed for the future. The Navy Hydrographic Office has published new charts of sections of the new St. Lawrence Seaway, extending the series of existing charts of a part of the seaway previously published by the Lake Survey. The Navy Hydrographic Office has issued new loran (long-range navigation) charts of the Caribbean, the Mediterranean, and the Atlantic. Important coordination is being achieved between the Lake Survey and the Canadian government in standardizing basic data on the Great Lakes, including the establishment of an international datum upon which to base chartable data. The Air Force Aeronautical Chart and Information Center has produced a new series of 1:1,000,000-scale operational navigation charts. The Coast and Geodetic Survey has published an experimental radio facility chart for user evaluation, and has continued the program of modifying the sectional aeronautical charts.

New Contributions.—The territorial sea has been delimited for the first time in a comprehensive set of measurements developed during 1959 by the Office of the Geographer of the U.S. Department of State. Lunar topographic maps are being prepared by the Army Map Service to portray coordinate points over the face of the moon. Conversion of these coordinates into heights, latitude, and longitude is achieved through the use of high-speed electronic computers. Precise glacier maps are being produced by the American Geographical Society to provide accurate measurements and evaluation of fluctuations of selected

WIDE WORLD

Fidel Castro addresses huge crowd in Havana, Cuba, after his triumphal entry into city on January 8 signaled victory of his revolutionary movement over the Batista regime.

Alaskan glaciers. The Navy Hydrographic Office has issued a new *Oceanographic Atlas of the Polar Seas* as the first of a series of similar atlases planned ultimately to cover all ocean areas.

Cartographic Techniques.—An improved method developed by the Navy Hydrographic Office will effect considerable saving in time and expense in constructing azimuthal equidistant projections. Extensive tests are being conducted by mapping agencies in the development of various improvements in lithographic processes and compilation-scribing techniques. The Army Map Service is now using the Variamat, an attachment to the copy camera lens, which operates on the vibration principle to vary line weights when photographically reduced or enlarged. The U.S. Army Engineer Research and Development Laboratory has developed a cartographic grid-ruling instrument capable of producing rectangular grids of high accuracy. The laboratory has also developed a multiplex reduction printer for use in preparing diapositives from aerial photographs.

Cartographers are receiving an important assist from the tiny Vanguard I satellite in eliminating errors on world maps. By tracking the radio signals of the satellite at various points, scientists are able to make major corrections on existing maps. For example, several Pacific islands which were found to have been mapped as much as a mile out of position were relocated by this method to an accuracy of about 250 feet. Another device for improving map accuracy has been developed by the U.S. Army Corps of Engineers. This instrument fixes the location of various points by observing the occultation of stars by the moon, and provides an accuracy to within 90 feet in distances between geographical locations. The device has shown that nearly all Pacific islands are misplaced from ½ to 2 miles on present charts.

ALBERT A. STANLEY,
Special Assistant to the Director,
U. S. Coast and Geodetic Survey.

CASTRO, Fidel (FIDEL CASTRO RUZ), Cuban revolutionary leader and premier: b. Mayarí, Oriente Province, Cuba, Aug. 13, 1927. Seemingly a study in contradictions—to his admirers, idealistic and dedicated; to his detractors, impractical, ruthless, demagogic—Fidel Castro is the Cuban rebel leader, who, after two years of guerrilla warfare in the country's eastern Sierra Maestra Mountains, brought about the downfall of the dictatorial regime of Gen. Fulgencio Batista on Jan. 1, 1959.

The son of a wealthy sugar plantation owner, Fidel Castro was educated in Jesuit schools in Santiago de Cuba and Havana. During further study at the University of Havana (from which he received a doctor's degree in law in 1950), he joined in an abortive attempt in 1947 to invade the Dominican Republic, whose totalitarian regime is a prime target of Caribbean revolutionaries. Between 1950 and 1953 he practiced law in Havana.

In an army coup on March 10, 1952, General Batista seized power from President Carlos Prío Socarrás and canceled the elections scheduled for the following June—elections in which Castro had planned to run for Parliament. On July 26, 1953 (the date was to become the symbol of Castro's subsequent movement against the Batista regime) a group of young men, led by Castro and his brother Raúl, attacked the Moncada Barracks at Santiago de Cuba. The attack failed, and Castro, together with his brother, was captured and sentenced to imprisonment on the Isle of Pines. Released in the general political amnesty of May 1955, Castro went first to New York City and then to Mexico, where he began to build a force for a second strike against the Batista government.

On Dec. 2, 1956, Castro and about 80 followers attacked Cuba's Oriente coast. Many of the band were killed, but Castro, his brother, and a small group of revolutionaries escaped into the Sierra Maestra Mountains, from which they launched unceasing attacks against government outposts. The Batista government claimed that Castro had died in the original assault, but his existence became known to the world in February 1957 when the New York *Times* published a series of articles based on interviews with the rebel leader by *Times* reporter Herbert L. Matthews. From then on, amid sympathetic approval from people in the United States and elsewhere, the rebellion gained momentum. Finally, on Jan. 1, 1959, as his defense became more and more disorganized, Batista was forced to resign and flee Cuba.

Almost immediately the high hopes raised by the Cuban revolution were dashed by the spectacular executions that began early in January. During the year, after summary military trials, more than 500 Batista followers ("war criminals") met death before firing squads. Answering charges of excess, Castro is quoted as saying (*Time* magazine, Jan. 26, 1959): "If we have to oppose world opinion to carry out justice, we are ready to do it." In defending his decision not to hold elections for at least four years, Castro said (April 22) that free elections might lead to a return of "oligarchy and tyranny." On May 22, in one of his marathon television appearances (it is not uncommon for Castro to speak for three or four hours), the Cuban leader declared that the drastic agrarian reform law, which many observers believed would harm the country's shaky economy, "will be imposed to the letter regardless of consequences."

Castro became premier of Cuba on Feb. 16, 1959. He resigned on July 17 in order to force the ouster of President Manuel Urrutia, who had voiced disapproval of some of the government's more extreme measures, because Urrutia was "delaying the action of the revolution." Castro resumed the premiership on July 26, during a rally of an estimated 500,000 persons in Havana.

Through a year of turmoil there ran a thread of anti-American sentiment in Castro's utterances. In a news conference on December 10, U.S. Secretary of State Herter expressed what appeared to be the official American attitude toward Cuba: "I think that when the revolution took place in Cuba we were all very hopeful that it would bring to Cuba a new and badly needed regime. [Since then] our relations with Cuba . . . have deteriorated."

(For a detailed account of Fidel Castro's first year in power, see CUBA.)

CELERY. See VEGETABLES.

CEMENT. According to the U.S. Bureau of Mines, cement production in the United States in 1958 fell just short of the peak established in 1956. In 1958, output was 321,490,000 barrels, compared with 308,255,000 barrels in 1957. Shipments in 1958 were 317,263,000 barrels, as against 299,189,000 in 1957. Cement was produced in 164 plants, of which the estimated annual capacity in December 1958 was 6% greater than in the preceding year. Of the total production capacity, 77.3% was used in 1958, compared with 78.2% in 1957. Imports in 1958 were 3,390,000 barrels

(4,427,000 in 1957), and exports were 641,000 barrels (1,330,520 in 1957). World output in 1958 reached 1,541,996,000 short tons, of which the United States supplied 21%. In the first nine months of 1959, the United States output of cement totaled 257,189,000 barrels, a 13% gain over the same period in 1957. (See MINERAL PRODUCTION for output of major producing countries.)

CENSORSHIP. A sweeping federal court opinion declaring an unexpurgated edition of *Lady Chatterley's Lover* (1928) to be salable in American bookstores, and an equally decisive ruling that the State Department is within its power in denying passports to news correspondents seeking entry to Communist China, balanced the books on the subject of censorship in the United States during 1959.

In setting aside, on July 21, a post office order banning the D. H. Lawrence book from the mails, Judge Frederick Bryan cited past decisions of the U.S. Supreme Court, beginning with *United States v. the Book "Ulysses"* in 1933, evolving the test of "whether to the average person, applying contemporary community standards, the dominant theme of the material taken as a whole appeals to prurient interests." To apply the test, the court considered the reputation of the author for serious writing, the record of the publisher for printing important works, and the general public tolerance for frank discussion of sexual details. (*Grove Press, Inc.* v. *Christenberry et al.*)

The passport case arose when William Worthy, Jr., a newspaper and radio correspondent, challenged the State Department's right to refuse him a passport to return to Communist China on news assignments. The department instituted a newsman's passport ban on travel behind the "bamboo curtain" in 1956, but modified it slightly in 1958. Upholding the department's power to fix or relax the ban, a U.S. Court of Appeals, on June 9, found it a proper implementation of an established policy of nonintercourse. "In foreign affairs," the court contended, "especially in . . . today's world of jets, radio and atomic power, an individual's yen to go and to inquire may be circumscribed. . . ."

A third major development of 1959 was the passage by Congress in September of the so-called Equal Time Act, modifying the section of the Federal Communications Act which had been strictly interpreted to require radio and television stations to grant equal time on the air to all bona fide candidates for political office, if any one candidate is given time. The amendment exempts from this requirement cases in which a candidate appears on a bona fide newscast or is interviewed for such a newscast, is featured in a documentary program, or appears on the scene of a bona fide news event being covered by the broadcaster as part of routine reporting. The new rule on "equal time" had yet to face the test of a court review. (See also LAW.)

Magazines and Books.—The decision in the case of *Lady Chatterley's Lover* seems to have brought American courts full circle from the rule handed down in the British case of *Regina* v. *Hicklin* in 1868, where the right of censorship was based on whether anyone in the community, rather than the average person, might be corrupted morally by a publication on a sex subject. In line with this general current philosophy, courts continued to strike down local ordinances aimed at banning comic books and similar periodicals handling sensational subjects. The California courts led the way in 1959 with an attack on a Los Angeles County ban of this nature. But in Oregon, the state Supreme Court upheld a statute which sought to lay down specific definitions of obscenity and to authorize censorship of violations. This law did not, the court maintained, violate the state constitutional provision of freedom of expression.

Motion Pictures.—Before the decision on the Lawrence book, the U.S. Supreme Court declared unconstitutional a portion of a New York State motion-picture licensing law which was used to ban a French motion picture version of the novel. After this decision and the ruling on the book, local actions on the film were also adverse to censorship efforts. In the case of another picture, *The Naked Maja,* some boards of censorship followed the rule in the *Chatterley* book case and cited the reputation of the artist whose painting was the subject of the picture in denying a ban; others objected to advertising for the picture which took the form of postcards reproducing the nude, and upheld local rulings prohibiting their circulation.

A Massachusetts court upheld a ban on a picture study of a nudist colony, under the state obscenity statute. But in Pennsylvania the Supreme Court held a similar state law unconstitutional under the 14th Amendment of the U.S. Constitution. The Pennsylvania statute prohibited the exhibiting of pictures "such as are sacrilegious, obscene, indecent, or immoral." Over vigorous dissent, a majority of the court held that this law failed for vagueness. (*Commonwealth* v. *Blumenstein.*)

International Developments.—The Cuban revolution spawned a rash of charges and countercharges of censorship, after Premier Fidel Castro announced the ending of the press control laws of the Batista regime. Periodic reports of counterrevolutionary activity were cited in justification of several press bans imposed by the Castro government in the months immediately following the triumph of his forces.

Similarly, in France the touchy issue of the Algerian rebellion was cited to justify French action in seizing an issue of *France-Observateur* and the cancellation of radio newscasts commenting on the Algerian question. *France-Observateur* and *L'Express,* both leftist publications, were the object of formal prosecution on subsequent charges of undermining public confidence in the army. Continued criticism of the government in Pakistan was generally believed to be the reason for the government's seizure of the chain of newspapers operated by the *Pakistan Times,* the dismissal of its management, and the operation of the chain by the government pending selection of a new management more acceptable to it.

British news agencies figured in censorship developments in Egypt and in India. In the former, a relaxation of the ban on foreign control of news dissemination resulted in the return of the Arab News Agency to British ownership. In India, dissatisfaction with the news policies of several independent agencies brought about a temporary ban on all distribution of foreign news except by the British-owned Reuters. During the critical period of Chinese invasion of Tibet and the flight of the Dalai Lama to asylum in India, the Indian government appealed to the press to refrain from "inflammatory" editorial comment; this appeal was renewed at the time of the Chinese invasion of isolated regions on the Indian frontier. No general censorship was imposed, however.

Elsewhere, rigid censorship continued in many eastern European, Asian, and Latin American countries, a fact documented by the publication in 1959 of *The Press in Authoritarian Countries,* prepared by the International Press Institute.

(For additional information, see the Index entry, *Censorship.*)

WILLIAM F. SWINDLER,
Professor of Legal History,
College of William and Mary.

CENSUS DATA, U.S. The estimated population of the United States, including armed forces overseas, totaled 178,500,000 on Oct. 1, 1959. This estimate includes the population of the new states of Alaska and Hawaii, which were admitted to the Union in January 1959 and August 1959, respectively. The nation's population has increased by more than 27 million, or at an average annual rate of about 1.7%, since the beginning of the 1950 decade, and the total is expected to reach 180 million before mid-1960.

Table 1 shows provisional estimates of the total population by states as of July 1, 1959.

Table 1—PROVISIONAL ESTIMATES OF THE TOTAL POPULATION OF STATES AND SELECTED OUTLYING AREAS OF THE U.S.: JULY 1, 1959.

(Total population figures include persons in the armed forces stationed in each state and exclude members of the armed forces abroad. Each estimate has been independently rounded to the nearest thousand from figures computed to the last digit; hence, the sums of parts shown may differ slightly from the totals shown. Amounts and percentage of change are based on unrounded numbers. The figures for the United States for July 1, 1959, include Alaska and exclude Hawaii, in accordance with the status of these areas on that date. Alaska was admitted to the Union on Jan. 3, 1959, and Hawaii was admitted on Aug. 21, 1959.)

State	Total Population		
	July 1, 1959 (provisional)	April 1, 1950 (census)	Per cent increase (+) or decrease (−), April 1, 1950 to July 1, 1959
UNITED STATES[1]	176,365,000[2]	150,697,361[3]	+17.0
Alabama	3,193,000	3,061,743	+4.3
Alaska	191,000	128,643	+48.2

Virginia	3,992,000	3,318,680	+20.3
Washington	2,823,000	2,378,963	+18.7
West Virginia	1,965,000	2,005,552	−2.0
Wisconsin	4,010,000	3,434,575	+16.7
Wyoming	319,000	290,529	+9.9
Puerto Rico	...[4]	2,210,703	...[4]
Hawaii	656,000	499,794	+31.2
American Samoa	...[4]	18,937	...[4]

[1] Includes Alaska. The estimated total population of the United States (with Alaska) including armed forces abroad, for July 1, 1959, is 177,103,000. [2] Total excludes Alaska. [3] Increase includes the population of Alaska on July 1, 1959, reflecting the addition of Alaska to the United States population between the 1950 Census and July 1, 1959. [4] Data are not available for July 1, 1959. Estimated total population for July 1, 1958 for Puerto Rico is 2,321,000; for American Samoa, 20,800.

In an estimated total population of 177,103,000 on July 1, 1959 (including Alaska but excluding Hawaii) there were 87,651,000 males and 89,452,000 females, or an excess of more than 1¾ million females.

According to the July 1, 1959, estimate, the white population numbered 157,290,000, and the nonwhite population 19,813,000. The proportion of nonwhite persons in the population in 1959 was 11.2%, as compared with 10.4% in 1950.

Table 2 shows estimates of the population as of July 1, 1959, by broad age groups, with changes since April 1, 1950.

Table 2—COMPOSITION OF THE U.S. POPULATION BY AGE, 1959 AND 1950

Age	Population, including armed forces overseas		Per cent change, April 1, 1950 to July 1, 1959
	July 1, 1959	April 1, 1950	
All ages	177,103,000	151,132,000	+17.2
Under 5 years	19,795,000	16,164,000	+22.5
5 to 13 years	32,388,000	22,180,000	+46.0
14 to 17 years	10,990,000	8,409,000	+30.7
18 to 24 years	15,872,000	16,081,000	−1.3
25 to 44 years	46,825,000	45,385,000	+3.2
45 to 64 years	35,853,000	30,720,000	+16.7
65 years and over	15,380,000	12,195,000	+26.1
21 years and over	106,908,000	97,698,000	+9.4

Households.—In March 1959 there were an estimated 51.3 million households in the United States, an increase of 7.7 million, or 18%, over the 43.6 million in March 1950. During the 1950–59 period the total number of households increased by about 861,000 a year, on the average. (See HOUSING.)

Family Income.—The median income of families in the United States was estimated at $5,100 in 1958, according to a March 1959 sample survey. A gain of $120 in money income between 1957 and 1958 did not represent a significant change in purchasing power for the average family, because prices also rose during this period. Of the nation's 44 million families, about 4½ million, or one in ten, received incomes of $10,000 or more in 1958; and an additional 18 million families, or two of every five, had incomes ranging between $5,000 and $10,000. At the other end of the income scale, 10½ million, or about one in four had incomes under $3,000. The remaining 11 million families were in the $3,000–$5,000 bracket.

Teachers and School Enrollments.—A sample survey made in October of the 1958–59 school year showed 1.6 million teachers in public and private schools below the college level, with about 80% of the total teaching in public schools. There were an estimated 42.9 million persons 5 to 34 years old enrolled in public, private, or parochial schools in the regular school system in October 1958.

Availability of Dwelling Units.—A sample survey made in the third quarter of 1959 indicated that 3.0% of all dwelling units were vacant and available for rent or for sale, with the "for rent" portion amounting to 2.4% and the "for sale" portion, 0.6%. Of available vacant dwelling units for sale, more than one half had three or more bedrooms; nine tenths were single-family houses; and about four tenths had been vacant for at least six months. The median price asked for nonfarm vacant dwelling units available for sale in the third quarter of 1959 was $12,700. Of the vacant dwelling units available for rent, only one tenth had three or more bedrooms; nearly four tenths were single-family houses; and about three tenths had been vacant for six months or longer. The median monthly rent asked for available nonfarm vacancies was $53.

Retail Store Sales.—Cumulative sales of all retail stores for the first eight months of 1959 amounted to $139.7 billion, about 9% above the $128.5 billion reported for the comparable period in 1958, according to the Census Bureau's monthly retail trade surveys. Wholesale trade surveys indicated cumulative sales of $83.6 billion for merchant wholesalers for the first eight months of 1959, 14% above sales of $73.6 billion in the comparable period of 1958.

Manufacturing.—In 1957 a record high of $12.1 billion was expended by manufacturers for new plant and new equipment, according to figures

from the 1957 Annual Survey of Manufactures which were published in 1959. The survey showed that of the $144.5 billion in value added by manufacture for the entire country, $92.4 billion, or approximately 65%, was accounted for by establishments located in the 62 largest standard metropolitan statistical areas. The 10 largest areas—New York–northeastern New Jersey, Chicago, Los Angeles, Detroit, Philadelphia, Pittsburgh, Cleveland, St. Louis, Boston, and San Francisco, in that order —accounted for $55.8 billion in value added by manufacture, or approximately 40% of the United States total.

External Trade.—Total United States exports, including military shipments, were valued at $10.1 billion in the first seven months of 1959, about 3% less than the $10.4 billion for the comparable period of 1958. Excluding military shipments, the export total for the first seven months of 1959 was $9.3 billion, also about 3% below the total of $9.6 billion for the comparable period of 1958. Total general imports amounted to $8.7 billion for the first seven months of 1959, compared with $7.3 billion for the corresponding period of 1958, an increase of about 18%.

Government Finance.—Total revenue of federal, state, and local governments in the United States in the fiscal year 1958 amounted to $130.4 billion. During the same year, governmental expenditure totaled $134.9 billion, or $4.5 billion above revenue, with the expenditure excess accounted for almost entirely by state and local governments, which expended $53.7 billion and had revenue of $49.3 billion during their fiscal years that ended in 1958.

Taxes.—Taxes collected by all governments in the United States in the fiscal year 1958 amounted to $98.4 billion, or $568 per capita, in comparison with total collections of $98.6 billion, or $579 per capita, in 1957. A 5% rise in tax revenue of state and local governments from $28.8 billion in fiscal 1957 to $30.4 billion in fiscal 1958 was more than offset by a drop in federal tax revenue from $69.8 billion to $68.0 billion in the same period.

The 1960 Census.—Preparations for the April 1, 1960, Census of Population and Housing—the 18th Decennial Census of the United States—were a major project at the Census Bureau in 1959. Field tests were made of the procedures and questionnaires to be used. The huge job of preparing the maps of more than 300,000 enumeration districts continued, forms and supplies were assembled, final plans were made for the field organization, and electronic computer systems were made ready for the tabulation of the results. An Advance Census Report Form would be mailed to each householder in March 1960 with the request that the answers to basic questions about the family and dwelling be filled in and made ready for the census taker's visit. At every fourth household on the census taker's rounds, a Census Household Questionnaire, listing additional questions, would be left. The householder would be asked to complete this form and send it to the census office in a postage free envelope.

Other Censuses.—During 1959 the tabulation and publication of the 1957 Census of Governments materials were completed. The 1958 censuses of Business, Manufactures, and Mineral Industries were conducted early in 1959, and later in the year many of the preliminary reports were issued. The Census of Agriculture was taken in the fall of 1959. The responsibility for the publication and analysis of labor force statistics, based on the Census Bureau's Current Population Survey, was transferred to the U.S. Department of Labor on July 1, 1959. Also effective on July 1, the collection and release of current construction statistics were centered in the Census Bureau by transfer from other agencies.

ROBERT W. BURGESS,
Director, Bureau of the Census.

CENTRAL AFRICAN FEDERATION. See RHODESIA AND NYASALAND, FEDERATION OF.

CENTRAL AFRICAN REPUBLIC. An autonomous republic of the French Community (q.v.), situated in west-central Africa north of the Belgian Congo. Estimated area, 241,700 square miles; pop. (est. mid-1958), 1,150,000, including (in 1956) 5,939 nonindigenous persons, mainly French. French is the official language. Chief towns are Bangui, the capital (est. pop., 84,638), Berbérati, and Bambari.

Government.—The Central African Republic was formerly the French overseas territory of Ubangi-Shari, included within the federation of French Equatorial Africa. On Dec. 1, 1958, the territory chose the status of autonomous republic of the French Community. As a member of the Community, the republic has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic materials, and certain other matters. The republic adopted its constitution on Feb. 9, 1959. The Legislative Assembly consists of 50 members elected for a five-year term by universal suffrage. Executive power is vested in a president (elected by the assembly), who appoints his ministry. David Dacko was elected president on April 30, 1959.

Education and Religion.—In 1958 there were 275 schools with a total of 47,254 pupils (28.1% of the school-age population. Government expenditure on education amounted to 693.8 million metropolitan francs, or 19.3% of the budget. The natives are mainly animists of the Bantu and other ethnic groups, although Christianity has penetrated in many areas.

Transportation.—The Central African Republic is landlocked and has no railroads. Roads and trails total 10,565 miles (1956), including 1,046 miles of hard-surfaced and improved dirt roads, and 2,575 of all-weather trails. The Ubangi River is navigable for 370 miles. The principal airport is at Bangui.

Production.—The majority of the population is engaged in subsistence agriculture, producing millet, sorghum, peanuts, pulses, and other foodstuffs. Chief commercial crops are cotton (est. 1957–58 output, 65,000 bales), coffee, peanuts, and palm kernels. The few existing industries include vegetable-oil refineries, cotton gins, soapmaking plants, and breweries. Gold deposits and diamond fields are worked in the southwest. Forest resources are extensive, although exploitation is still only on a small scale.

Foreign Trade.—Exports in 1958 totaled 7.4 billion metropolitan francs; imports, 10.3 billion. Chief exports in 1958 were: cotton, 37,500 metric tons; coffee, 5,500; lumber, 3,524; and diamonds, 85,700 carats. France is the republic's chief trading partner.

Principal Events, 1959.—Barthélémy Boganda, founder of the Movement for the Social Emancipation of Africa (MESAN) and first head of the newly autonomous republic, was killed in an air crash near Bangui on March 29. Boganda was virtually uncontested as leader and spokesman of the republic, and his death left a void in leadership. The first elections to the Legislative Assembly under the new constitution took place on April 5 and 25, the MESAN winning a substantial majority of seats. Prior to the election, however, the Boganda government had passed electoral laws which virtually assured one-party rule. David Dacko, a cousin of Boganda, was elected president by the assembly on April 30.

CENTRAL AMERICA. The southern end of North America, from the Isthmus of Tehuantepec (Mexico) to the Isthmus of Panama. The term Central American States usually denotes the five republics of Costa Rica, Guatemala, Honduras, Nicaragua,

GENERAL ELECTRIC COMPANY

Dr. Robert L. Coble, inventor of a new ceramic material named Lucalox, compares translucent disk of the material with a conventional ceramic. Lucalox is valued for its strength and ability to withstand very high temperatures.

and El Salvador, but may also include British Honduras, Panama, and the Canal Zone (qq.v.). (See also INTER-AMERICAN AFFAIRS.)

CENTRAL TREATY ORGANIZATION. See MIDDLE EAST.

CERAMICS. Most of the ceramics industry enjoyed a better year in 1959 than in 1958, although labor unrest and the effects of the steel strike hindered some segments. Recovery of most of the market losses suffered in the 1958 recession, combined with outstanding technological successes, brought the industry to high business and technical levels. Because of its close alliance with the building and automotive fields, however, the industry was sharply hit by metal shortages in the last quarter of 1959 as a result of the steel strike. Imports of a variety of ceramic products continued to claim greater portions of the domestic market.

Whitewares.—Dinnerware, sanitaryware, floor and wall tile, hotel and institutional china, electrical porcelain, artware, and lamp bases all experienced improved sales and increased production in 1959. Wall tile, dinnerware, and electrical porcelain came under pressure of imported goods, but markets previously lost to products using plastic materials were recaptured. Manufacturers of semivitreous dinnerware, which suffered production losses from an extended strike, began producing a vitrified product designed to replace a substantial part of their normal semivitreous output. Wall tile and sanitaryware production rose in pace with increased residential and commercial construction, but electrical porcelain output fell below expectations because of a lag in expansion of electrical generating capacity.

Glass.—The flat glass industry was hit by a crippling strike in early 1959, but recovered and finished the year on a strong basis. The year also witnessed the amalgamation of a top European producer and the fourth largest United States flat-glass manufacturer, with the announcement of plans for a new plate-glass facility in the United States in 1960. The container-glass producers also suffered a strike, which in its later stages reduced production. The technological highlight of the year was the announcement by Pilkington Brothers, Ltd., an English plate-glass producer, of a new process to manufacture high-quality plate glass without the costly grinding and polishing operations. These were eliminated by floating the liquid glass ribbon on a molten bath of metal, resulting in a smooth, natural surface after the glass cooled to a solid.

Brick and Structural Clay Products.—The brick industry suffered market losses as a result of competitive building materials which were available at lower in-the-wall costs. Efforts to promote the use of brick panels to reduce construction costs met with little success. Sewer pipe output continued at high production levels, and benefited from the marketing of longer unit pipe lengths and of patented joints which reduced in-the-ditch costs. Increased use of glazes and glaze colors helped all structural clay product markets, and the lightweight clay block ("Burns Block") introduced in 1958 made spectacular production gains.

Electronic and New Ceramics.—This section of the ceramics industry reported its most successful year in 1959. High levels of business in the transistor, dielectric, and high alumina fields brought rapid expansion of production facilities. One of the most important developments of the year was the recovery of nose cones from two full-range (5,000–6,000 miles) Thor-Able rockets on April 8 and May 21. The nose cones, which were fabricated from a ceramic material, survived re-entry into the atmosphere at full speed. Equally noteworthy was the longest space communication ever accomplished by the United States, made possible by the use of a ceramic diode transmitting tube in the Pioneer IV space vehicle launched on March 3, 1959 (see SPACE FLIGHT).

A new ceramic material, called Lucalox, was announced by the General Electric Co. The company said that the material marked the first time that a polycrystalline ceramic that readily transmits light had been made from powders. It said that Lucalox, made of aluminum oxide, also has great strength, is able to withstand high temperatures, and can be pressed into any shape.

General Electric also announced the development of a revolutionary new electronic component, the "tunnel diode," which in some forms utilizes ceramic-type materials. The tunnel diode is reported to be capable of surpassing even the transistor in its electronic capabilities.

Porcelain Enamels.—The porcelain enamel industry, which had been losing some of its business to other finishes, was encouraged in 1959 by a new type of porcelain enameling iron, which, at competitive prices, makes possible high-quality finishes and reduced losses. Another important development was the continued expansion of production and marketing of electroluminescent products, including dash panels by Sylvania for the 1960 Chrysler and Imperial automobiles. Short supplies of metal, caused by the steel strike, reduced some annual outputs of porcelain enameled goods to below 1958 levels.

Refractories.—This industry, with its close ties to steel, also was hard hit in late 1959. Those companies producing refractories for the glass and ceramics industries and for other fields not directly related to steel managed to finish the year with production only slightly below 1958 figures, but other major producers suffered greatly. Technological developments involved the creation of higher-temperature refractory materials with space age applications.

CEREAL GRAINS. See AGRICULTURE; GRAINS.

CEYLON. A self-governing country (independent since Feb. 4, 1948, within the Commonwealth of Nations) and a member of the United Nations, Ceylon lies directly south of India in the Indian Ocean. With outlying islands, its area is 25,332 square miles. Exclusive of nonresidents in the armed services and on ships, the population totaled 8,097,895 (8,154,580 when adjusted for underenumeration) at the 1953 census, and was officially estimated at 9,388,000 on July 1, 1958. Major ethnic groups (1953 census) are the Sinhalese, 5,616,705; Indian Tamils, 974,098; Ceylon Tamils, 884,703; Ceylon Moors, 463,963; Indian Moors, 47,462; and Burghers and Eurasians, 45,950. Buddhism is the prevailing religion; the official language is Sinhalese. Colombo (pop., 426,127 in 1953) is the capital and chief port.

Government.—A governor general (Sir Oliver Goonetilleke since 1954) represents the British crown. Parliament consists of a House of Representatives of 101 members (95 elected and 6 appointed);[1] and a Senate of 30 members, half of whom are elected by the House and half appointed by the governor general. S. W. R. D. Bandaranaike, head of the Sri Lanka Freedom Party, who became prime minister on April 12, 1956, died on Sept. 26, 1959, as the result of four shots fired at him on the previous day by an assassin. He was succeeded by Wijayananda Dahanayake. (See also below, *Principal Events, 1959.*)

Finance.—Government expenditure in the 1959–60 budget was estimated at Rs.1,399.9 million (1 rupee = U.S.$0.21); loan fund expenditure, at Rs.336.5 million. Revenue was estimated at Rs.1,342.5 million, leaving an overall deficit of Rs.393.9 million, to be reduced by additional tax revenue, domestic loans, and foreign aid.

On March 13, 1959, Ceylon undertook to purchase United States rice and wheat flour to the value of Rs.40 million, which money was subsequently to be made available to Ceylon for economic and business development. On July 16, an agreement was signed with West Germany for assistance of 6 million Deutsche marks for the repair of flood damage.

Education.—On May 31, 1958, government and assisted schools numbered 7,591, and enrollment totaled 1,852,077. Education is free from kindergarten to the university level. In 1958 government expenditure on education was Rs.183,657,556. Higher education is provided by the University of Ceylon and by the Vidyodaya University of Ceylon, inaugurated by the governor general on Feb. 18, 1959.

Transportation and Communications.—There are about 17,000 miles of roads, of which 9,744 miles are motorable. On June 30, 1958, motor vehicles numbered 108,003, including 65,937 private cars and cabs. There are 897 miles of railways (810 miles broad gauged). Air Ceylon Limited operates internal and international services, and Indian Airlines, British Overseas Airways Corporation, Qantas Empire Airways, Trans World Airlines, and K.L.M. (Royal Dutch Airlines) also serve Ceylon.

Ceylon has 162,134 radios (1956) and 30,017 telephones (1958).

Production.—The economy is primarily agricultural, a large proportion of Ceylon's exports consisting of coconuts and their products (grown in 1958 on 1,239,180 acres); rubber, of which Ceylon is the world's fourth largest producer (100,196 tons produced on 664,000 acres in 1958); and tea, which is grown on 572,000 acres (413,160,000 pounds in 1958). The 1,240,000 acres given over to rice, the staple cereal, yielded 36,600,000 bushels of paddy in 1958. Also grown are cacao, citronella, cotton, and tobacco, along with corn and sorghum as secondary food crops.

Mineral production includes graphite (8,256 tons in 1957), sapphires, rubies, and aquamarines. The manufacture of salt is a government monopoly. The important fishing industry engaged over 13,800 registered boats in 1957.

Foreign Trade.—Exports were valued at Rs.1,711 million in 1958 (Rs.1,682 million in 1957); imports, at Rs.1,717 million (Rs.1,804 million in 1957). During 1958, Ceylon exported 27,700 tons of copra, 56,736 tons of dried coconut, and 44,336 tons of coconut oil. Exports of rubber totaled 207,201,059 pounds, valued at Rs.258,108,629; those of tea, 410,773,414 pounds, valued at Rs.1,130,969,156. The chief customers were the United Kingdom, Communist China, and the United States; principal suppliers, the United Kingdom, Australia, India, Burma, and Communist China.

In the first half of 1959 exports were valued at Rs.833 million, and imports at Rs.878 million. Between Dec. 31, 1958, and Sept. 30, 1959, Ceylon's foreign exchange reserves declined from $172 million to $149 million. On June 13, 1959, Ceylon and Communist China signed contracts for the purchase of 230,000 metric tons of rice by the former and 30,000 tons of rubber by the latter.

Principal Events, 1959.—Recurrent political crises marked the year. Rancorous debates were frequent in the House of Representatives, and on March 3 the leader of the Trotskyite opposition, Dr. N. M. Perera, called a one-day strike against the proposed amendments to the Public Security Act. Nonetheless, the amendments were approved by the Senate on March 12. On the following day, after he had given his assent to the new law, which greatly enlarged the government's emergency powers, the governor general proclaimed an end to the state of emergency which had been in effect since May 27, 1958. On May 18 a cabinet crisis resulted from the resignation of two Marxist ministers, and on June 9 a new cabinet, composed entirely of members of the Sri Lanka Freedom Party, was sworn in.

[1] The new House of Representatives to be elected in March 1960 was to have 151 members.

- UNITED NATIONS; WIDE WORLD

Wijayananda Dahanayake (right) was sworn in September 26 as premier of Ceylon, succeeding S. W. R. D. Bandaranaike (left), who died on that date from an assassin's bullets.

Described by his victim as "a foolish man dressed in the robe of a monk," a Buddhist physician (later identified as Talduwe Somarama Thero) gained entrance to the private residence of S. W. R. D. Bandaranaike on September 25, and shot and fatally wounded the prime minister, who died on the following day. His assailant was wounded and arrested by a police sentry. From his deathbed the prime minister urged restraint and patience on the nation. Himself a Buddhist convert, he appealed for clemency for the assassin. A national emergency was declared on September 25 (it was not ended until December 2), and a search began for parties to a possible conspiracy. On November 26, seven persons, including Mrs. Vimala Wijewardene, formerly minister of local government and housing, were indicted. Bandaranaike's body lay in state for two days of official mourning, during which sympathy with the Ceylonese in the loss of a respected leader was voiced in many nations.

Wijayananda Dahanayake, minister of education in the Bandaranaike cabinet, was sworn in by the governor general on September 26 as prime minister. A Marxist earlier in his political career, he later became strongly anti-Communist. On taking office, he pledged his government to continue unchanged the policies of his predecessor. Dissension soon arose, however, and Dahanayake barely survived votes of confidence on October 30 and November 27. On his advice, therefore, the governor general dissolved Parliament on December 5 and called for new elections on March 19, 1960. On December 7, Dahanayake resigned from the Sri Lanka Freedom Party, which voted instead to expel him. He in turn replaced five party members of his cabinet on December 8. Dr. Charles P. de Silva, new party president, unsuccessful in his request to the governor general to appoint him prime minister in place of Dahanayake, resigned from the cabinet on December 14.

Visitors to Ceylon during the year included President Tito of Yugoslavia, with whom, on January 25, Prime Minister Bandaranaike issued a communiqué reaffirming their policy of nonalignment. A new American ambassador, Bernard Gufler, arrived in Ceylon on August 23. On October 12, Ceylon was elected to the U.N. Security Council.

DONOVAN ROWSE,
Author and Publicist.

CHAD. The Republic of Chad is an autonomous republic of the French Community (q.v.), situated in central Africa. Estimated area, 495,400 square miles; pop. (est. mid-1958), 2,600,000, including (in December 1956) 4,884 nonindigenous persons, mainly French. The official language is French. Chief towns are Fort-Lamy, the capital (est. pop., 30,600), Fort-Archambault, Moundou, and Abéché.

Government.—A former French overseas territory included within the federation of French Equatorial Africa, Chad chose the status of autonomous republic of the French Community on Nov. 26, 1958. As a member state of the Community, Chad has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic minerals, and certain other matters. The republic adopted its constitution on March 31, 1959. Legislative power is vested in a Legislative Assembly of 85 members elected for a five-year term by universal suffrage. Executive power is exercised by a premier chosen by the assembly (by simple majority); investment of the premier and his cabinet must be approved by a two-thirds majority of the assembly. François Tombalbaye, leader of the Chad Progressive Party, was chosen premier on June 18.

Education and Religion.—As of Jan. 1, 1958, only 8.6% of the school-age population was attending school. Schools numbered 163, with a total of 33,312 pupils. Expenditure on education amounted to 581.2 million metropolitan francs, or 11.5% of the budget. The population is sharply divided ethnically and religiously, with Arabized Moslems predominating in the north, and Christianized and pagan Bantu tribes in the south.

Transportation.—Chad is landlocked and has no railroads. Roads and trails total about 18,000 miles, including (in 1956) 188 miles of hard-surfaced and improved dirt roads, and 299 miles of all-weather trails. The principal airport is at Fort-Lamy.

Production and Trade.—Chad is the chief cattle-breeding country of the tropical Sahara region, cattle numbering an estimated 3.5 million head. The government has fostered the industry by building watering stations and providing veterinary and marketing services. The major cash crops are cotton (est. 1957–58 output, 120,000 bales) and peanuts (est. 1956, 150,000 metric tons). Millet, rice, wheat, beans, and dates are also grown. The few existing industries include chiefly cotton gins (25 in operation) and meat-packing plants. Chad's exports in 1958 totaled 13 billion metropolitan francs; imports, 17 billion. Principal exports were cotton (4.2 billion francs), live animals and meat products, fish, and peanuts.

Principal Events, 1959.—Religious and regional rivalries were responsible for a succession of governments in early 1959. Premier Gabriel Lisette, a leader of the Chad Progressive Party, was defeated in the Legislative Assembly on February 10 and succeeded by Gontchome Sahoulba, of the Chad Rural Independent Group. The Sahoulba government was followed on March 13 by a short-lived coalition regime, which was in turn succeeded in late March by a government headed by François Tombalbaye, of the Chad Progressive Party. In the elections of May 31, the Chad Progressive Party won 57 of the 85 seats in the Legislative Assembly, and Tombalbaye was renamed premier on June 18.

CHAMBERLAIN, Owen, American physicist: b. San Francisco, Calif., July 10, 1920. For their discovery in 1955 of the antiproton, an important element in the concept of antimatter, Chamberlain and Emilio Segrè (q.v.) were named co-winners of the 1959 Nobel Prize in physics, awarded to them at Stockholm, Sweden, on December 10. The two University of California scientists shared prize money of $42,600.

After studying at Dartmouth (B.S., 1941), Chamberlain worked from 1942 to 1946 on the government's wartime Manhattan Project (which built the atomic bomb), first at the University of California's Berkeley campus and later, with Segrè, at Los Alamos, N. Mex. He did research in nuclear physics at the Argonne National Laboratory, near Chicago, after the war, and in 1949 took his doctorate in physics at the University of Chicago. In 1948 he became associated with the Department of Physics at the University of California at Berkeley. At the time of the award, he was on leave as Loeb lecturer in physics at Harvard University.

The existence of an antiproton had been surmised many years before Chamberlain's and Segrè's discovery. Paul A. M. Dirac, English Nobel laureate in physics in 1933, offered the hypothesis that to each electrically charged subatomic particle there corresponds an antiparticle of the same mass but of opposite charge. The existence of a positron (or anti-electron) was shown in 1932 by Carl David Anderson, an American physicist who shared the Nobel Prize in physics in 1936. But the antiproton eluded scientific investigators for more than 20 years until the University of California team produced and observed the particle in the powerful atom-smasher (bevatron) at the university's radiation laboratory.

The antiproton is equal in mass and strength of charge to an ordinary proton, but it carries the opposite (negative) electrical charge. Chamberlain and Segrè demonstrated that when the antiproton strikes a proton or neutron of ordinary matter, both particles in the collision are annihilated and their energy released. Although antimatter does not exist naturally on earth, some scientists theorize that somewhere in the universe whole galaxies are composed of this material. The discovery of the antiproton, while without any immediate practical application, marks an important advance in the study of the universe.

CHANNEL ISLANDS. Situated in the English Channel near the northwest coast of France, these British islands have a total area of 75 square miles and a population of 100,000 (mid-1958 est.). Principal islands are Jersey (area, 27,717 acres; 1954 pop., 55,288) and Guernsey (15,654 acres; 1957 pop., 40,721); dependencies of Guernsey include Alderney (1,962 acres; 1957 est., 1,350) and Sark (1,274 acres; 1957 pop., 437). St. Helier is the principal town on Jersey, and St. Peter Paul, on Guernsey. Government is administered by committees chosen by each island's elected states (legislative assemblies), under lieutenant governors (for Jersey, Gen. Sir George Erskine; for Guernsey, Vice Admiral Sir Goeffrey Robson). Alderney and Sark have their own constitutions. On Jan. 21, 1959, Sark's assembly repealed a 400-year-old law requiring each adult to work two days a year on road maintenance.

Revenue for Jersey in the fiscal year 1958 was £4,154,123, and expenditure, £3,351,910; revenue for Guernsey in fiscal 1957 was £2,423,812, and expenditure, £2,139,492. In Jersey, schools of all types enrolled 7,958 pupils in 1958; in Guernsey, pupils totaled about 6,500. Total exports to the United Kingdom in 1958 were valued at £17,558,215; imports, £27,120,917. Principal exports are potatoes, tomatoes, flowers, grapes and the islands' famous cattle (427 head in 1957). Tourism is an important industry.

CHECKERS. See SPORTS, GAMES, AND SHOWS.

CHEESE. Production of marketed cheese in 1958 and earlier years, in major countries for which data are available, is shown in the accompanying table. According to the Food and Agriculture Organization of the United Nations, cheese production in these countries has increased by 70% over the prewar period. The greatest increase has occurred in the USSR, which in 1958 ranked sixth among all cheese-producing countries. The United States is the leading producer, followed in order by France, Italy, West Germany, and the Netherlands.

[1] Figures include only cheese which is domestically or internationally marketed, and relate mainly to cheese produced in dairy plants. [2] Estimate. [3] Mostly goat cheese. [4] 1946–49. [5] 1952. [6] Year ending June 30. (Source: *Monthly Bulletin of Agricultural Economics and Statistics*, July 1959, Food and Agriculture Organization of the United Nations.)

Leading consumers of cheese, on a per capita basis, in 1957 were Norway, 8.9 kilograms (1 kg. equals 2.2046 lbs.); Switzerland, 8.5 kg.; France, 8 kg.; Denmark, 7.3 kg.; Sweden, 7 kg.; and Italy and the Netherlands, 6.5 kg. each. United States and Canadian consumption per capita amounted to 3.5 kg. each. (See also DAIRY PRODUCTS.)

CHEMISTRY. Nuclear Chemistry.—A new process for making thorium metal of very high purity was developed in 1959 and may contribute to the ultimate selection of the thorium-uranium fuel cycle (regarded as the best one) for use in thermal reactors. Although more plentiful than uranium, thorium generally is less concentrated in ores, and also suffers from the detrimental effects of oxygen. The new method involves the conversion of thorium nitrate to oxalate and finally to chloride, after which sodium or magnesium reduces the chloride to thorium metal of 99.8% purity. The purer the metal, the more likely it is to be used as a nuclear fuel.

While uranium-235 is in very general use as a fuel element in power reactors, a new fuel fabrication plant began producing plutonium in 1959 for the same purpose. Only 0.7% of the naturally occurring uranium is U-235, while plutonium can be made directly from uranium-238, which comprises over 99% of the natural material. When plutonium is made from U-238 in a fast reactor, more plutonium is produced from the blanket of U-238 which surrounds it. Plutonium is an extremely dangerous material, since it gives off 5 million times as many alpha particles as does U-238 or thorium. In the new plant, all work is done in hoods, using glove boxes and remote control, and the operations are carried on in an atmosphere of helium.

Krypton-85 is a gas, and as such would not be regarded as a convenient source of beta emissions. However, a form of hydroquinone functions as a "clathrate," or a sort of cage which traps this krypton isotope, so that the mixture may have as much as 30 times the radioactivity of the gas alone at atmospheric pressure. In preparing the clathrate with its trapped krypton, the alpha form of hydroquinone is heated with 5% of its weight of krypton-85 in an autoclave until it melts. As it cools, the hydroquinone assumes the beta structure and traps the radioactive gas in the cage-like crystals. Typical uses of the material are in the detection of such atmospheric pollutants as sulfur dioxide and ozone. In this process the air is drawn through a tube containing the clathrate, and the hydroquinone (in powder form) is oxidized and releases the radioactive krypton-85; its activity is then measured by a Geiger counter.

Very dilute radioactive wastes may be disposed of by dilution with sea water at great distances from shore. In addition to the practice of storing more concentrated materials in worked-out salt mines and other cavities that can be sealed off permanently, several processes have been developed to lock the wastes into permanently insoluble clays, gels, and glasses. Recently, lime and a complex silicate have been fused with the more active wastes to form a glass which is said to lose not more than one millionth of its weight a year when exposed continuously to water. (See also RADIATION; SANITARY ENGINEERING.)

New peacetime applications of nuclear energy include the following. Toxic materials in the atmosphere that are not radioactive but are difficult to detect because of their great dilution may now be converted to solid particles by chemical means. These particles, which are given an electrical charge by exposure to radioactive substances in an ionization chamber, may then be readily detected and their concentration measured in terms of parts per billion. A linear accelerator is capable of driving finely divided metallic particles of one metal into the lattice structure of another metal to form alloys that cannot be made by fusing the two metals together. By employing harmless radioactive isotopes, blood cells may be tagged to determine blood volumes in studies of food metabolism, the role of blood-volume expanders, and various functions of the blood stream. Highly radioactive elements such as cobalt-60 are being used increasingly in chemical industries to bring about vulcanization of certain synthetic rubbers in the cold, and to produce nitrogen dioxide from nitrogen and oxygen at relatively low temperatures. In regions where fuels cannot be readily transported, nuclear energy may be used to distill brackish water or sea water through the heat of fission reactions in power reactors. (See also ATOMIC ENERGY.)

Metals.—A plant with over 70,000 cubic feet of internal space, completely filled with argon gas, is processing high-temperature refractory and reactive metals, which require temperatures of 4,000°F. Among the metals handled in this plant are nio-

bium, tantalum, and molybdenum. The argon used is of the highest purity and contains less than 0.0005% of other elements. The plant is equipped with air locks, safety controls, and an argon purification apparatus. Operators wear "space suits," which are fed with conditioned air through one hose while exhaled air is removed through another. All finished products are coated to prevent the action of oxygen and nitrogen when they are exposed later to air at high temperatures.

In order to obtain an extremely pure chromium for use in high-temperature alloys for gas turbines and nuclear reactors, a process was developed in 1959 to employ a volatile iodide. As the iodide decomposes, the iodine is returned to the process as the highly purified metal is deposited. Impurities are said to be as low as 10 ppm. (parts per million) of oxygen and 5 ppm. of nitrogen.

Molybdenum in sheet form that has five times the ductility of ordinary sheets of this metal is produced by pressing the powdered metal into an ingot, sintering the particles together in a high-frequency induction furnace, and rolling to the desired thickness. Such sheets range from 0.001 inch to 0.750 inch, can be bent practically double, and can be formed into parts at low temperature. The largest single use of this metal in sheet form is in electron tubes and transistors; it is also used in various shapes where high-temperature strength is required.

Rhenium, one of the more recently discovered natural elements, was produced in 1959 at the rate of 1,000 pounds per year, but its many special applications probably will require a great increase in production. Rhenium is removed along with much larger amounts of molybdenum in the production of copper. As molybdenum flue dust is roasted, much of the rhenium escapes as an oxide dust. By use of water sprays, the oxide, Re_2O_7, is recovered and converted to potassium perrhenate, $KReO_4$.

As little as 0.25% of beryllium serves as a precipitation hardener in titanium alloys which have very high tensile strength at temperatures up to 1,000°F. The alloys also contain aluminum and molybdenum, and are heat-treatable. The decomposition of the beta phase to the alpha-plus compound is said to be very rapid. In the field of heat treatment of titanium alloys, an aluminum silicone paint has been developed which is applied to titanium sheets before they are sent to the furnace. When the organic ingredients of the paint burn out, the coating, which has the appearance of a glass, is removed by a caustic solution. The function of this coating is to prevent oxidation of the metal during heat treatment.

Titanium may be alloyed with as little as 0.1% of palladium to produce a material that resists corrosion nearly as well as tantalum. The technique involves mixing powdered titanium and powdered palladium, compressing it very heavily, and melting the alloy by electric heat. Galvanic couples, which have hydrogen overvoltage, are assumed to be formed on the surface.

Metals are being applied to nonmetallic materials by allowing vapors from a metal heated in a high vacuum to condense on a cold surface. Paper may be coated with aluminum to be employed in heat insulation. Heat-reflective coatings are put on the back of a transparent material, so that they are visible through the glass or plastic. The coatings are retained by a protective paint on the back of the object. Metal coatings of only a few millionths of an inch in thickness are applied to outer surfaces, which are then covered by a transparent lacquer. Aluminum is deposited (by a vacuum process) in relatively thick films on steel; such films are nonporous, so ductile and adherent that 180° bending is possible, and they also have a high resistance to abrasion. Chromium, tungsten, and molybdenum are applied as coatings by a vapor-phase method involving the use of volatile compounds which decompose on a heated surface, in atmospheres of helium and argon. (See also IRON AND STEEL; METALLURGY; MINING.)

Glass and Ceramics.—Semiconducting devices may be coated with a low-melting glass in order to protect them from moisture. Sulfur, selenium, arsenic, and thallium are components of these glasses, the first two predominating. They are said to bond well to ceramics and silicate glasses, and except for the effects of alkaline solutions, their durability is about the same as ordinary glasses. Coating is accomplished either by dipping or by vaporization and condensation; the fluid range is between 125°C. and 350°C.

The new field of "glass-ceramics," introduced in 1957, has been expanded by a complete discussion of the principles and processes underlying the conversion of glass to a fine-grained crystalline material. The size and properties of the new glass-ceramic material are rigidly controlled by the use of a catalyst which forms submicroscopic crystals. These in turn act as nuclei for another crystal phase, made up of the major components of the molten material. The catalyst crystals are said to amount in number to between 10^9 and 10^{15} per cubic millimeter, but the size of the crystals formed on them ranges from 1 micron to 100 angstrom units. The products have greater tensile strength and hardness than ordinary ceramics, and many have very low thermal expansion coefficients. Chemical resistance is about the same as in the ordinary chemical glasses, and most are also electrical insulators. The most common of many nucleating agents is titanium dioxide, TiO_2. In the production of household articles and high-temperature industrial glassware, the main composition of the glass-ceramics is a lithia-alumina-silica system. For use in electrical insulation and guided missile radomes, magnesia is substituted for lithia.

In addition to zirconia, or zirconium oxide, which has a melting point of 4,850°F. and excellent strength properties, a number of combinations of metals and ceramics are being employed in high-temperature equipment. Small amounts of metals are being added to refractory oxides to produce a new class of ceramics. If the thermal expansion of a ceramic is about the same as that of a metal, the two may be used together by fabricating them through brazing or hot-pressing. Materials so used include molybdenum-alumina; a stainless steel and fosterite; and an alumina-mullite, reinforced by molybdenum. (See also CERAMICS.)

Inorganic Chemicals.—Two methods have been suggested for lessening the danger of strontium-90 fallout. One of these is based on the fact that strontium finds its way into the bones of animals and humans in somewhat the same way as calcium. If a calcium compound, free of strontium, is added to the food of a child, that much less strontium is built into bone growth. Another possibility is the use of an organic chelating agent, which will take up strontium in the body to form a complex compound and cause its elimination through the urine. Since strontium does not form an integral part of bone-crystal nuclei but is deposited on the outside of calcium phosphate nuclei to become ultimately a component of bone, chelating agents have a more immediate access to strontium before it becomes firmly attached to the calcium phosphate microcrystals.

It has been found that potassium bicarbonate

in finely divided form puts out fires faster than the same grade of sodium bicarbonate. Tests have shown that gasoline and oil fires have been extinguished in half the time required by the best agents now available. Dense white clouds are formed by chemical action (the color of the flame becomes lavender), and the amount of heat given off by the fire is greatly reduced, thus permitting firefighters to come in closer to flames. The size of the potassium bicarbonate particles must be controlled, and additives such as tricalcium phosphate are required to prevent caking. The petroleum industry is regarded as the largest possible user of the new extinguisher, which also has potential uses in fighting fires in shops and homes.

Magnesium nitrate is being employed in the production of concentrated nitric acid (up to 99% material) from the acid made by the catalytic oxidation of ammonia. The salt is placed in columns through which the vapors of nitric acid pass. The nitrate is made by the action of dilute nitric acid on magnesium carbonate and subsequent evaporation. The common process of dehydration of ammonia-oxidation nitric acid involves sulfuric acid, and the reconcentration of this dehydrating material.

Rocket Fuels.—Two new plants for producing liquid hydrogen (a rocket fuel with the highest thrust) in large quantities were put into operation in 1959. A very pure variety of hydrogen is made by partial oxidation of heavy fuel oil, the oxygen being derived from the distillation of liquid air. The nitrogen, also obtained in this process, is employed in cooling the hydrogen in the liquefaction process. Orthohydrogen is converted to the more effective parahydrogen in the presence of ferric oxide as a catalyst.

Liquid fluorine as an oxidant for rocket fuel was reported in 1959 as being close to operational use; this material gives very high specific impulse, particularly with liquid hydrogen. Nitrogen tetroxide as an oxidant with hydrazine is said to equal the performance of liquid oxygen with petroleum distillate fuels.

In the field of solid propellants, aluminum powder was employed in 1959 both in missiles and meteorological research rockets. Other ingredients of such propellants include polyvinyl chloride and ammonium chlorate, with a plasticizer oil. The plastic is introduced into the mix in the form of microscopic spheres suspended in the plasticizer oil. As the soft dough is heated, the plastic spheres fuse to form a tough mass in which the aluminum and oxidant are embedded. With aluminum, such propellants have a theoretical flame temperature of about 5,000°F.

Looking far ahead to goals yet unattained, some of the rocket power proposals of 1959 included the use of cesium as a plasma for ion propulsion motors; atomic power plants with a nuclear pile and hydrogen and helium, free radicals; and a metastable form of helium yielding ten times the power of present high-energy fuels. (See also MISSILES; SPACE FLIGHT.)

Synthetic Resins and Plastics.—Microporous plastics, which have been in commercial use for several years as battery separators, now will be applied extensively to textiles. A thin film of such a plastic will be laminated to a regular fabric. The advantage of such a dual material is that it will transmit vapors and at the same time hold back water. Polyethylene and polyvinyl chloride plastics are the first materials to be developed into microporous products, but practically any thermoplastic resin can be used. The technique of their manufacture is to mix resin powder with starch, and to shape and cook the mixture. The starch swells and produces a cell structure in which there are tiny, interconnected holes. The swelled material is passed through a hot bath of dilute sulfuric acid; the starch is hydrolyzed to sugars, which dissolve; and the plastic resin then shrinks, but is now honeycombed with an infinite number of fine holes of the size of the original starch granules. Possible uses of this material include protective clothing, filters, bandages that permit rapid healing of small cuts as well as burns, membranes for blood oxygenation, solar stills, and electrodialysis membranes for purification of saline water.

Photosensitive plastics showed great promise in the field of photography in 1959, and some authorities considered these materials as the greatest development since the invention of the daguerreotype. A grainless and silver-free plastic copying film has been put on the market. The film may be placed against a negative, exposed briefly to fluorescent light, and dropped into boiling water. The product may be used either as a projection slide or a negative. Another potentially important product (in the development stage in 1959) is a plastic printing plate, made by exposing the plastic, in contact with a photographic negative, to ultraviolet light, and washing it with a solution of an alkaline substance. The time required for finishing and mounting on a press is about 20 minutes. (See also GRAPHIC ARTS.)

Lighter-than-water liquids are being satisfactorily transported in seagoing barges made of woven nylon and coated inside with a synthetic rubber of the acrylonitrile-butadiene type. In one test, 40 tons of liquid hydrocarbons were conveyed at sea a distance of 500 miles, successfully riding nine-foot waves. Such barges, which are towed by tugs adapted to ocean travel, costs only about one fifth as much as steel barges.

After 100 years of effort, production of a stable polymer from formaldehyde reached large-scale manufacturing operations in 1959. The material, known as polyoxymethylene, or paraformaldehyde, is a product whose strength approaches that of metals, and it will probably be used to replace brass, aluminum, and zinc to a certain extent. In producing this material, very pure formaldehyde is necessary, and solvent polymerization is brought about by an ionic catalyst. Capping the ends of the linear polymer (by making either esters or ethers) provides stability—the purpose being to prevent attack by water. Each chain is regarded as having as many as 1,000 formaldehyde units. Two grades are available—one for molding, and the other for extrusion. Its dense crystalline structure is said to be responsible for hardness, rigidity without brittleness, resistance to solvents and water swelling, and a low coefficient of friction.

Pentacrythrytol reacts with hydrogen chloride, the product being converted by ring closure to a cyclic ether, which polymerizes to form a thermoplastic resin. It is classed as a chlorinated polyether, and is said to have excellent mechanical, electrical, and chemical properties, as well as high resistance to the action of chemicals. It will accordingly take its place along with nylon, fluorocarbons, and similar materials, as well as metals and alloys, in anticorrosion equipment.

Pigmented resin powder may be fluidized with air as the carrier gas, and introduced into a chamber in which there are hot metallic objects to be coated. The resins fuse to the metal and have remarkable adherence. This technique permits the coating of irregular objects to almost any desired film thickness, and does away with solvent losses. Several types of plastics may be used, the best known being those of the epoxy type.

Smokes whose rate of fallout can be regulated

by the size of their particles are being made by melting such foam-forming plastics as polyether- and polyester-based urethanes, as well as phenol-formaldehyde resins. The droplets of molten resin are injected into a hot gas stream, such as those produced by gas turbines, jets, and rockets. The particles (by metallizing them) may be made to serve as tracers for rockets and satellites. Smoke screens of this type will shield against thermal radiation from nuclear attacks, and in peacetime may protect orchards against frost, cut evaporation losses at reservoirs or petroleum storage tanks, decontaminate air, and serve as carriers for insecticides. (See also PLASTICS.)

Rubbers, Natural and Synthetic.—The drying of rubber, both natural and synthetic, after pressing as much water as possible from the material precipitated from the coagulated latex, has the disadvantages of drying outside with seepage to the exterior, as well as exposure to large volumes of air. A process developed in 1959 involves use of a Banbury mixer of a special type. The shearing action applied to the raw rubber heats the material to a point above the boiling point of water. Steam is flashed off, and preliminary pressing is eliminated. Such materials as carbon black, silicates, whitings, oils, and other additives may be worked into the rubber at the same time. Synthetic rubbers that ordinarily require vacuum drying may be handled by this process.

A research of purely theoretical interest in the field of both natural and synthetic rubber, which may, however, give some insight into the behavior of this material under deformation and infrared radiation, is based on the substitution of deuterium for every hydrogen atom in the molecule of *cis*-1, 4-polyisoprene. When this product is polymerized, it is more elastic than natural rubber, which is made up of units of this hydrocarbon containing ordinary hydrogen. This difference is explained by the assumption that deuterium atoms do not attract each other to the extent characteristic of hydrogen atoms.

Air has been replaced successfully in tubeless tires by injecting urethane foams, the liquid material being introduced through a hole in the tire rim. The foam sets and bonds both to the tire and the rim, and softens only after a temperature of 300°F. is reached. No difference in heat build-up in hot weather is observed in comparison with air-filled tires. All sorts of deliberate damage has been inflicted on such tires without interfering with their performance on cars for a fairly long period of time, indicating immunity to flats and blowouts.

Butyl rubber, largely employed in the manufacture of inner tubes, will be utilized in the manufacture of auto tires. Butyl rubber is made by mass polymerization of isobutylene and isoprene. In making tires, the polymer is distributed in water to form a synthetic latex. By this means the rubber bonds to tire cord, rayon, or nylon. Butyl tires are said to give a smooth ride, have excellent stopping ability on wet pavement, and are largely free of squeal on turning corners. Lesser uses of butyl rubber include insulation of wire and cable, and the manufacture of wading pools, medical goods, and auto parts. (See also RUBBER.)

Petroleum Products.—In the recovery of petroleum from oilfields by removal of material from rock and sand surfaces, a detergent must be easily adsorbed. Nonionic detergents of the ethylene oxide-propylene oxide type show considerable superiority over other types. The area covered by a molecule of this detergent is of the order of 2,880 square angstroms, as compared with 35 to 200 of these units for other materials used for the same purpose. The structure of this kind of nonionic detergent is characterized by large hydrophobic groups which are centrally located.

Branching and cyclic hydrocarbons have higher octane ratings than paraffinic hydrocarbons, which are being removed by the use of molecular sieves. These are made up of crystalline aluminosilicates which have a high percentage of pores of molecular dimensions. In this process the paraffins are selectively adsorbed, and may be recovered later and used as feed in isomerization operations. Octane ratings are further increased by such additives as tertiary butyl acetate. By use of a catalyst containing a Friedel-Crafts component, it has been found commercially possible to produce very high yields of branched-chain hydrocarbons from straight-chain paraffinic raw material. The operation is carried on at relatively low temperatures, from 80°F. to 120°F. The product has a high research octane rating, the new process markedly extending the supplies of both aviation and premium motor fuels.

An acetic anhydride treatment, followed by a caustic rinse, was developed in 1959 to remove from petroleum distillates those impurities which cause corrosion, form sludge, and give rise to unpleasant odors. Esters are formed with oxygen, thioesters with sulfur, substituted amines with nitrogen, and harmless reaction products with complex organic impurities.

Commercial jet planes, which began large-scale operations in 1959, and the military rocket program both depend on synthetic lubricants. Diesters and complex esters of dibasic acids are the principal materials for such lubricants, which are also employed as hydraulic fluids and greases. These lubricants, which include polyphenyl ethers, are not only quite stable under nuclear radiation, but are much more resistant to heat than present synthetic lubricants. In this field, greases operating over a wide range of temperatures use aryl-substituted urea as a thickener in a nonpetroleum fluid.

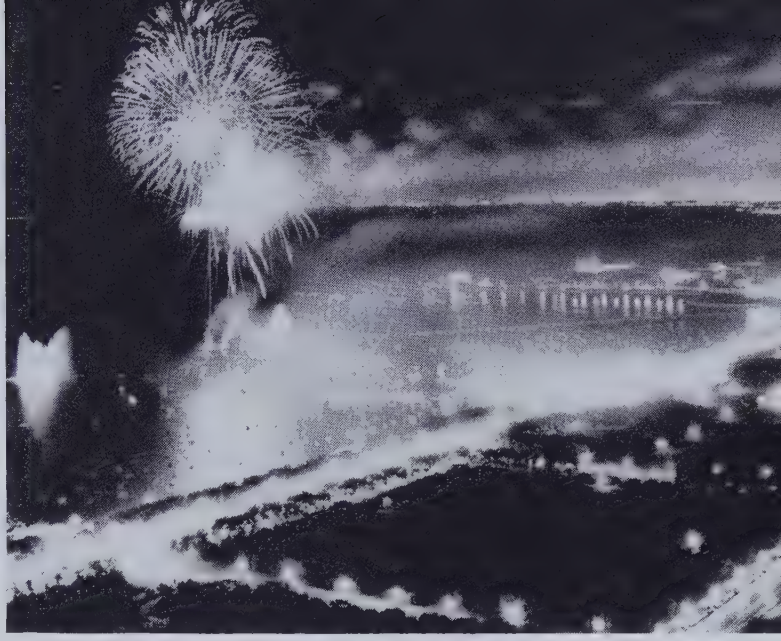
Consulting Chemist.

CHEMOTHERAPY. Madribon.—A major contribution to the chemotherapy of bacterial infections is the low-dosage sulfonamide, Madribon (2,4-dimethyl-6-sulfanilamido-1,3-diazine). Laboratory studies have demonstrated that the substance is effective against a wide variety of microorganisms, including streptococci, pneumococci, staphylococci, meningococci, bacillary influenza, pseudomonas, and numerous enteric bacteria. Clinical reports have substantiated the laboratory results, in that Madribon was found to be highly effective in respiratory, urinary tract, and soft tissue infections.

A single daily dose of the drug is reported to be sufficient for full therapeutic action. Mild and transitory side effects, consisting chiefly of nausea, vomiting, skin rash, or headache, have been observed in less than 2 per cent of the individuals receiving the medication. Madribon differs from the other sulfonamides in that it is present in the body primarily as the free and active form, and is excreted in the urine as a highly soluble glucuronide. It is believed that this metabolism minimizes the possibility of crystalluria or kidney damage, the principal drawback of the early sulfonamides.

Triburon.—*Staphylococcus aureus, Streptococcus pyogenes* and *Escherichia coli* are known to be the most common bacteria which cause skin and wound infections. Of particular concern has been the dis-

UPI



(Above) Queen Elizabeth II smiles to crowd lining route of her tour of Chicago, July 6. (*Right*) Fireworks light up the sky in gala climax to queen's one-day visit to the city.

semination of strains of staphylococci insensitive to many of the modern chemotherapeutic agents. It is, therefore, not surprising that investigations have continued for new chemical agents for the treatment of surface infections.

The most recent contribution has been a synthetic chemical compound, Triburon, a bis-quaternary diamine derived from β-ionone. In the laboratory the substance is characterized by high in vitro and local in vivo activity against the bacteria of skin and wound infections, including staphylococci resistant to other therapeutic agents. Moreover, the drug is also active against the parasite, *Trichomonas vaginalis,* and the fungus, *Candida albicans.* In the clinic, Triburon was found effective for the prevention and treatment of numerous dermatologic disorders, including such conditions as infected burns, pyodermas, infected dermatoses, folliculitis, and postoperative infections. It has also been found to be clinically effective against trichomonal, nonspecific, and monilial vaginitis. The incidence of skin irritation or sensitivity is considered to be low and consists chiefly of burning, itching, or erythema.

Griseofulvin.—Griseofulvin ushers in a new era in the treatment of mycoses caused by dermatophytes, in that for the first time oral therapy is effective. The antibiotic was isolated originally from *Penicillium griseo-fulvum Dierckx* and is now extracted from the mycelia of this fungus. Other species of *Penicillium,* such as *patulum* and *janczewski,* also produce the active principle. In test tubes the substance was shown to be active in low concentrations against all the common dermatophytes. The first experiments in a living host were carried out in guinea pigs infected with the fungi commonly causing ringworm in humans, namely *Microsporum canis* and *Trichophyton mentagrophytes.* Clinical improvement occurred as early as four days after administration of the compound. After eight days very little of the disease process was discernible, even by laboratory criteria.

It is claimed that patients with *Tinea corporis, Tinea pedis,* and *Tinea capitis* usually clear within one to three weeks. Although fungus infections of the nails take as long as four months to clear, normal nail growth is seen much earlier. Infections caused by *Candida albicans, Blastomyces dermatitidis,* and *Malassezia furfur* are reported to be uninfluenced by the drug. (See also Dermatology.)

Tennecetin.—Tennecetin is a new antifungal antibiotic isolated from *Streptomyces chattanoogensis.* In vitro it has a wide antifungal spectrum, being effective against the dermatophytes, many species of *Candida,* the pathogens causing deep mycoses, and numerous apathogenic fungi. It has little or no activity in the test tube against bacteria. In animals the drug is highly toxic when given by the intraperitoneal, subcutaneous, or intravenous route. Orally it seems to be poorly absorbed. At the present time it is claimed that topical administration has been effective in the treatment of various types of ringworm and vaginal infections. Because of the poor absorption from the intestinal tract, the drug has been suggested as a possible treatment for yeast and fungal overgrowths of the intestines.

Psicofuranine.—Isolated from *Streptomyces hygroscopicus* var. *decoyicus,* Psicofuranine (6-amino-9-D-psicofuranosyl purine) is inactive in vitro by traditional methods but in mouse protection studies is effective against *Streptococcus hemolyticus, Staphylococcus aureus,* and *Escherichia coli* when administered by the oral or subcutaneous routes. Experimental infections with *Diplococcus pneumoniae, Proteus vulgaris, Pseudomonas aeruginosa, Salmonella,* nematodes, and viruses do not respond to the antibiotic. More recently Psicofuranine has been claimed to exhibit high anti-tumor activity in rats, although its usefulness for controlling tumors in humans is as yet undetermined.

CHEWING GUM. The United States chewing gum industry in 1957 employed 5,006 persons (3,855 of them in production) whose wages totaled $22,280,000, according to the latest figures in the *Annual Survey of Manufactures: 1957.* Value added by manufacture was $105,274,000, compared with $97,840,000 in 1956. Shipments of chewing gum products were valued at $175,501,000 in 1957, an increase of almost $10 million over 1956.

CHICAGO. Second most populous city in the United States and center of the second most popu-

lous standard metropolitan area, Chicago, Ill., covers a land area of 221.4 square miles. Its estimated population in mid-1958 was 3,769,500, while that of the metropolitan area in mid-1959 was 6,651,400.

Statistical data for the Chicago area in the first eight months of 1959: births, 99,944, against 163,345 in all of 1958; steel production, 13,298,200 tons, compared with 16,800,000 in full year 1958; investment in industrial building and land, $210,501,000, a figure that exceeded the entire previous year's total of $198,930,000; new dwelling units, 35,900, compared with 40,587 for the 12 months of 1958; foreign ships arriving, 797, a total well beyond the 683 in all of 1958; passengers cleared at airports, 7,719,648, compared with 11,240,111 during the previous full year.

Major city improvements continued to be in the planning stages in 1959. Although a final decision on the location of the University of Illinois Chicago branch had not been made by late 1959, there were indications that consolidation of the South Side railroad terminals could not be achieved in time to meet the university's timetable calling for opening by 1963, and that the Chicago Park District would be likely to make Garfield Park available as an alternate site. The University of Chicago in June announced a five-year, $49.5 million building program within the proposed 819-acre Hyde Park–Kenwood Community urban renewal project. On October 5 the university dedicated its new $4.1 million law center on Midway Plaisance.

Plans were also announced for the construction of a $25 million group of buildings, made up of two 40-story apartment towers and an office building, which will be built under auspices of the Building Service Employees Union. The project will occupy the North Bank of the Chicago River between State and Dearborn Streets, and is scheduled for completion in 1962. (See also HOTELS.)

Visiting royalty, baseball, municipal elections, and the Great Lakes water issue were among highlights of the year for Chicago. Queen Elizabeth II (q.v.) and Prince Philip sailed into the city on July 6 for the first visit to Chicago by a reigning British sovereign. Accompanied by Canadian Prime Minister Diefenbaker and British Ambassador Caccia, the queen arrived from Canada aboard the royal yacht *Britannia*. She told a luncheon audience that the St. Lawrence Seaway (q.v.), linking Chicago with the Atlantic Ocean, would be a new bond between Canada and the United States and between Great Britain and the American Midwest.

Illinois members of Congress again sought passage of a bill authorizing an increase in the diversion of Lake Michigan water at Chicago. Such legislation has been vetoed twice by President Eisenhower, although the city and the Chicago Sanitary District claim that an increased diversion beyond the 1,500 cubic feet per second now authorized would make sewage dilution more effective. Great Lakes states have consistently opposed any increase, arguing that it would tend to lower the lake levels to the disadvantage of shipping, and the Canadian government has been adamant in its opposition. Although Congress enacted no new law on the subject in 1959, the U.S. Supreme Court did decide to order the first full-scale review of its 1930 decision, which is the basis of the present diversion limitation. The high court named Judge Albert B. Maris as special master to review the entire situation.

A Democratic sweep of the municipal elections took place on April 7, resulting in the re-election by overwhelming majorities of Mayor Richard J. Daley, City Clerk John Marcin, and City Treasurer Sidney Deutsch. In addition, 46 of the 50 City Council seats were won by Democrats. In November, six contested area judgeships were also won by Democrats, and the voters approved administration-sponsored issues of general obligation bonds totaling $66 million to finance street lighting ($25 million), sewers ($15 million), bridges and viaducts ($15 million), slip and dock facilities ($6 million), fire alarm boxes ($3 million), and police and fire stations ($2 million). A bond issue of $9.5 million for rehabilitation of the Cook County Hospital was also approved.

A special commission of the Illinois legislature, charged with studying the problems of the Chicago metropolitan area and especially the adequacy of local government services, reported itself opposed to the creation of any kind of metropolitan government at this time. The commission urged instead that increased attention be paid to the possibility of voluntary cooperation between the many governments in the Chicago area. The legislature implemented this proposal by a general authorization for any two or more municipalities to exercise jointly any powers which they are otherwise authorized to exercise individually.

Chicago was cheered by victories of the Chicago White Sox baseball team as it achieved its first American League pennant in 40 years, but then was depressed by the White Sox loss to the Los Angeles Dodgers in the World Series. (See also SPORTS, GAMES, AND SHOWS.)

Director, Institute of Government and Public Affairs, University of Illinois.

CHILD HEALTH. See CHILD WELFARE; PEDIATRICS; UNITED NATIONS CHILDREN'S FUND; WORLD HEALTH ORGANIZATION.

CHILD LABOR. Child labor in the United States is regulated by three federal acts and by individual state laws. The federal Fair Labor Standards Act sets the minimum age at 14 for employment outside of school hours in nonmanufacturing occupations except agriculture, at 16 for employment during school hours in interstate commerce, and at 18 for occupations declared hazardous by the secretary of labor. For children employed in firms that supply goods under federal contract, the federal Public Contracts Act sets the minimum age at 16 for boys and at 18 for girls. The federal Sugar Act sets the minimum age at 14 for employment in cultivating and harvesting sugar beets and cane. State child labor laws vary greatly both in standards and in coverage. They govern the ages, hours, and conditions of employment and prohibit certain occupations for minors.

Child Labor Violations.—The most frequent type of violation of child labor provisions is the illegal agricultural employment during school hours of children under 16. Most of those involved are under 14. (In 1958, 3,115 of the 4,399 children found working illegally in the fields instead of attending school were in this age group.) They are most often employed on farms growing cotton, strawberries, tomatoes, and potatoes.

Many of those illegally at work are migrant children who are employed in commercial agriculture and rarely attend school. Numerous studies have shown that they are educationally retarded, although they have as much ability to learn as any other children. According to the U.S. Office of Education, they constitute the nation's largest illiterate group.

Legislation.—Since 1950, there have been no substantial changes in the federal law. Of the 47 state legislatures (including Alaska and Hawaii) that met in regular session during 1959, 41 considered bills to modify child labor and related school attendance laws. Bills aimed at strengthening existing laws were about equaled by those aimed at relaxing them.

The growing concern about the need to improve job opportunities for youth without breaking down protections was apparent in an unusual number of bills altering work-permit requirements or procedures. Protective measures were strongly retained in the form of compulsory school attendance laws. New York averted a serious threat by de-

feating bills which would have exempted from existing laws "incorrigible" or "problem" children, "unable to profit" from further schooling, and both New York and Illinois defeated measures that would have lowered the minimum age for employment during school hours to 14. Nebraska and New Hampshire strengthened their school attendance laws. But attempts to raise the minimum age for employment above 16 were defeated in New York, Indiana, Kansas, Texas, and Hawaii. In Hawaii, an emergency measure (limited to June 1961) was enacted permitting the employment of minors under 14 by coffee growers in areas where sufficient adult labor is unavailable. North Dakota lowered its compulsory school attendance age from 17 to 16 years, and Tennessee to 15 (when recommended by the school board).

Twenty states considered minimum wage bills affecting minors, most of them intended to exempt youths, especially students employed for relatively few hours, from minimum wage provisions. New Mexico set a 12-year age minimum (with parents' consent) for newsboys, exempting them from work certificate, hour, and night work provisions of its child labor law. Maine established night work prohibitions for youngsters under 16 years between 9 P.M. and 7 A.M.

Youth and Work.—According to a joint population report issued in June 1959 by the U.S. Department of Commerce and the Bureau of the Census, the job situation for students and other young persons was not so favorable in 1958 as in other recent years. Jobs were fewer; more young people were looking for work; and those who had jobs were working shorter hours, on the average. The total number of students of high school age who were working full or part time in October 1958 was estimated at 1.9 million, compared with 2 million the year before. Most severely affected by the year's downturn, however, were young people 14 to 17 years old not enrolled in school. In October 1958 their rate of unemployment, always relatively high, was 23%, 10 percentage points higher than the level of the two previous years. It is becoming increasingly difficult for teenagers who drop out of school before graduation to get jobs. Nevertheless, about 880,000 young people left school in 1958 without receiving their diplomas.

EMPLOYED MINORS, AGES 14–17

Date (April)	14 and 15 years		16 and 17 years	
	Agricultural	Nonagricultural	Agricultural	Nonagricultural
1954	190,000	462,000	255,000	1,068,000
1955	149,000	450,000	278,000	1,003,000
1956	216,000	588,000	272,000	1,176,000
1957	151,000	600,000	274,000	1,162,000
1958	169,000	622,000	282,000	1,023,000
1959	200,000	573,000	279,000	1,183,000

(Source: U.S. Bureau of the Census.)

Job losses for those aged 14 to 17 were far out of proportion to their representation among the total employed during the recession. Fewer students of high school age in rural farm areas were in the labor force in the summer than in former years, but there was an increase in private household employment, especially among girls. Among the boys, there was a tendency to replace hard-to-find manufacturing jobs with work as sales or stock clerks. On the whole, however, the outlook for teenagers improved with the general recovery in the latter part of 1958.

Hours of Employment.—Average weekly hours for high school student workers were affected by the business decline more than was the workweek for other age groups. The hours they normally worked were cut back more than three times as much as those of all nonfarm workers. Their workweek in nonfarm jobs averaged only 18.4 hours (less than half the 40.1 average for all nonfarm workers).

CHILD WELFARE. The year 1960 will be unusual in the history of child welfare, both internationally and within the United States, for the concentrated study of children, their needs, and the conditions and services essential to their wholesome development.

International Services.—During 1959 the United Nations Children's Fund (UNICEF), the World Health Organization (WHO), and other agencies cooperated in extensive campaigns to improve the lot of children. Antimalaria campaigns reached some 35 million children and mothers in 51 countries where malaria remains one of the most common causes of death to children; campaigns against tuberculosis resulted in the vaccination of 13.5 million children in 25 countries; and 400,000 mothers and children afflicted with leprosy were treated in 25 projects.

A typical example of UNICEF emergency relief was the organization's response early in 1959 to a request from the government of Somaliland for supplies to protect 250,000 children and mothers from famine due to extreme drought. UNICEF promptly arranged for the shipment of 1,500 tons of rice and 600 tons of skim milk powder (a gift from Canada, with UNICEF paying only for ocean freight), and planned to ship 500 tons of lentils and beans.

Realization of the need for such widespread efforts, and confidence in agencies of the United Nations, led 16 countries to increase their contributions to UNICEF in 1959. Allocations totaling $28 million were received from 87 countries, and even more significant was the $70 million in matching funds provided by the countries aided by UNICEF. The U.S. Congress increased its appropriation from $11 million in 1959 to $12 million in 1960.

In 1960, UNICEF, WHO, and other international organizations will collaborate closely on even more sweeping projects for reducing illnesses and deaths among children and for enriching the lives of those surviving the pestilences and other health hazards still threatening the lives of the very young in many of the most densely populated countries of the world.

The 1960 objectives of UNICEF include 23 projects in child feeding, nutrition education and related activities, milk conservation, and promotion of the use of protein foods; 20 basic maternal and child health projects, including environmental sanitation, and care of handicapped children and premature infants; and 15 projects for prevention and control of tuberculosis, yaws, venereal diseases, trachoma, leprosy, and typhus. Four emergency projects approved for 1960 were to provide blankets for refugee mothers and children in Morocco and Tunisia; to supply vitamins and pay for the transportation of 1 million pounds of skim milk powder to victims of floods in Taiwan; and to continue feeding of 50,000 children in Jordan border villages.

Typical of the 1960 objectives of WHO are programs aimed at eradicating yaws (a highly infectious disease which cripples many children) from Africa south of the Sahara Desert, and at eradicating malaria and smallpox from the Amer-

icas. Another WHO program to be stressed in 1960 is its work towards creating safe water supplies. Frequently, WHO supplies the personnel needed in such efforts, while UNICEF provides equipment and supplies.

In October 1959 the U.N. General Assembly's Social, Humanitarian and Cultural Committee unanimously approved a children's charter, a set of principles declaring that children are entitled without discrimination to special care and protection and to equal educational opportunities. The charter was approved by the General Assembly on November 20.

The World Refugee Year, designated by a resolution of the United Nations General Assembly, began on June 30, 1959. Fifty-nine nations pledged themselves to ease the plight of refugees living in displaced persons' camps or under other unsettled conditions. About one third of the world's 47 million refugees are children. (See also REFUGEES AND DISPLACED PERSONS; UNITED NATIONS CHILDREN'S FUND; WORLD HEALTH ORGANIZATION.)

Canada.—Manitoba's Child Welfare Act was amended in 1959 to protect children whose parents deny them essential medical treatment. The death of a child due to such deprivation was one of several cases arousing the popular concern which led the provincial legislature to pass a bill allowing courts, on the evidence of three or more licensed physicians, to declare children neglected if the parents have refused or neglected to provide necessary medical care or treatment. If immediate medical care must be given to save the child's life or to avoid serious injury, the court may make the child a ward without informing the persons normally entitled to receive notice of the court hearing.

Amendments in programs for mothers' allowances were made in four provinces, including Manitoba, where benefits were extended to several categories of mothers not previously covered, and the age-limit for eligibility for children's benefits was raised by one year to the 16th birthday.

In Saskatchewan, the responsibility for committing delinquent children to training schools was transferred from the courts to the minister of social welfare and rehabilitation. A child adjudged to be delinquent may be declared neglected and made a ward of the minister, who may at his discretion commit the child to a correctional institution.

United States.—The sixth White House Conference on Children and Youth is to be held in Washington, D.C., from March 27 to April 2, 1960. In 1909, when the first of these conferences was called by President Theodore Roosevelt, the care of dependent children was the principal subject considered. Establishment of the federal Children's Bureau was the most significant outgrowth of this first White House conference. The 1919 conference, focusing on minimum health and welfare standards for mothers and children, reflected the worldwide ferment in social planning following World War I. Extensive research and improved practices in the field of child welfare during the prosperous 1920's enabled the 1930 conference to produce several volumes impressive for their extensive consideration of education, child health, and delinquency. The next decade, overclouded by economic depression and the ascendancy of dictators in Europe, was followed by the 1940 conference, which emphasized the special needs of children in a democracy. The 1950 conference, at which delegates advocated teamwork among the various professions concerned with child welfare, was followed by a period of inquiry into child development by leaders in many professions, with consequent improvement of many services to children.

Preparation of children and youth for participation in a world of change is a definite goal of the 1960 conference. Preliminary studies by conference planning committees listed 40 subjects to which attention was being directed. The three most frequently mentioned were: juvenile delinquency (prevention and/or treatment), emotionally disturbed children (diagnosis and treatment), and retarded children (treatment and training).

Juvenile delinquency, as never before, commanded the attention of the general public, news writers and broadcasters, religious and civic bodies, law-enforcement authorities, and legislatures in 1959. The U.S. Congress, through two subcommittees, heard volumes of testimony on juvenile delinquency, and more than 20 bills dealing with different aspects of delinquency were introduced during 1958–59. In communities of all sizes, adults and young people considered the problem of waywardness in youth, convening for this purpose forums of citizens and high school students. A 1959 publication, *Predicting Deliquency and Crime,* by Sheldon and Eleanor Glueck, received widespread attention from those whose duties require them to be familiar with theories of children's behavior. (See also CRIME).

The number of children born out of wedlock was on the increase in 1959, as was the number of junior and senior high school girls who became unmarried mothers. Federal and national agencies and many state and local groups were united in their concern about this problem, which has increased in seriousness during the decade since 1950; and the problem will probably be on the agenda of the 1960 White House Conference on Children and Youth.

Child health authorities were alarmed in 1959 about a definite increase in the occurrence of poliomyelitis. More than 60 million children need inoculation against this disease. Data released in 1959 by the Children's Bureau (Department of Health, Education and Welfare) listed accidents as the leading cause of death for children of all ages; for children over five years of age, deaths from cancer ranked second. Marked progress had been made by 1959 in the diagnosis and treatment of congenital heart disease, and early in 1959 Congress earmarked $1.5 million for care of children suffering from this disease. (See also PEDIATRICS.)

Among the publications of the Children's Bureau most widely circulated during the year were *The Mentally Retarded Child at Home* (1959) and the latest revision of *Infant Care,* which since its first edition has had a total circulation of 40 million copies.

CHILDREN'S LITERATURE. Superabundance was the word in the children's book field in 1959, as the number of titles published (1,647) rose to the highest on record. The year saw an expansion of those trends which have been growing for the past half-dozen years or so, with few major innovations in subject matter or style.

There was increased emphasis on books about foreign lands, both factual and fictional, as well as on translations of European books. In the latter

category were *The Land of Foam,* by Ivan A. Efremov (Yefremov), a long, colorful, meaty, but sometimes tedious novel by a Russian scientist concerning a young sculptor of ancient Greece and his adventures in Africa; and Hertha von Gebhardt's *Girl From Nowhere,* a haunting, rather disturbing, beautifully written story from Germany. Among American authors presenting aspects of the foreign scene were Elizabeth Janet Gray (Mrs. Morgan Vining), who drew on her own experiences for *The Cheerful Heart,* a story of postwar Tokyo, and Harry Behn, whose story of Mexico, *The Two Uncles of Pablo,* was much admired by the critics.

There were also several new bilingual volumes of stories for young children, including the three Berlitz Language Books for Children (in French, Italian, and Spanish), each of which contains two nursery tales. Each line of foreign language text is accompanied by a phonetic transcription and by a translation, in separate lines. A gay contribution to this new cosmopolitanism is made by *This Is Paris* and *This Is London,* in which Miroslav Sasek, a Czech artist, catches the essence of those cities in bright, witty pictures and captions, providing a fine new kind of travel book.

It was a big year for picture books, and although many of them were mediocre, the general level was higher than in 1958. Among the outstanding newcomers were Leo Lionni, whose *Little Blue and Little Yellow* (a very unusual story about color mixing, with sophisticated, abstract illustrations) baffled some adults and delighted the children; Ann Kirn, with two books, *Leopard on a String* and *Full of Wonder*—the latter a beautifully designed and colored introduction to the hobby of rubbings; and Walter T. Cummings, whose slight but evocative story, *The Girl in the White Hat,* was enhanced by rhythmically patterned, decorative pictures.

To everyone's pleasure, three popular authors brought out new books: Ludwig Bemelmans, *Madeline and the Gypsies* (not quite top-drawer Bemelmans, but good fun); Phyllis McGinley, *Lucy McLockett,* a charmer for little girls; and Dr. Seuss, *Happy Birthday to You!* In *Do You See What I See?,* Helen Borten guides young children to an appreciation of line, form, and color as seen in everyday objects. Madeleine Gekiere's stylized, elegant drawings for John Ciardi's engaging nonsense verses, *The Reason for the Pelican,* were judged the best illustrations of the year by *The New York Times Book Review* jury.

Poetry was even more plentiful than in 1958. There were at least a dozen volumes of original verse, including *The Blackbird in the Lilac* by the English poet, James Reeves; Mary Ann Hoberman's *Hello and Goodbye,* childlike and funny; and Robert Frost's *You Come Too,* a collection of Robert Frost's poems selected especially for young people by the poet himself.

Factual books, which have been one of the major trends in recent years, continued to mount in numbers, especially in aeronautics, space, astronomy, and other scientific fields. Outstanding science books included *Exploring Science* by Jonathan N. Leonard; *Discovering Chemistry,* a brilliant introduction to experimentation, by Elizabeth K. Cooper; and such specialized items as Rosemae W. Campbell's *Tops and Gyroscopes,* explaining the principles of gyroscopic devices. In *People and Places,* Margaret Mead introduces young people to some of the problems, methods, and conclusions of anthropologists.

Even the very young reader was more generously supplied with scientific information than ever before. Millicent E. Selsam's *Seeds and More Seeds,* a nature study, was added to Harper & Brothers' I Can Read series; and Mae and Ira Freeman's *You Will Go to the Moon,* which sold nearly 60,000 copies in six months, was added to the Beginner Books series, distributed by Random House.

The output of historical studies, which had boomed in 1958, increased again in 1959. Among the most interesting were: *America Is Born,* an account of the first three centuries of the making of the United States, by the eminent historian Gerald W. Johnson; *The Byzantines,* by Thomas Caldecot Chubb, a brilliant treatment of a rather abstruse subject; and Lynn Montross' *Washington and the Revolution.* Biography was, as usual, in large supply.

As a corollary to this interest in history, there was a new emphasis on the classical era. Of the 10 volumes of myths and legends in The Legacy Books (still another new series from Random House), five—including Robert Penn Warren's *Gods of Mount Olympus* and Clifton Fadiman's *Voyages of Ulysses*—deal with Greek and Roman mythology; and the major portion of Anne Terry White's *Golden Book of Myths and Legends* (magnificently illustrated by Alice and Martin Provensen) was devoted to adaptations of the Greek myths.

Three volumes were added to the comparatively small shelf devoted to archaeology: Raymond Holden's *Secrets in the Dust,* a kind of junior-level *Gods, Graves and Scholars;* Anne Terry White's *All About Archaeology,* written for a somewhat younger audience than was her popular *Lost Worlds,* and less distinguished; and a translation from the German, *The Golden Pharoah,* in which Karl Bruckner mingled factual and fictional techniques in the old-fashioned European manner to tell of the discovery of Tutankhamen's tomb. Olivia Coolidge's volume of short stories, *Roman People,* portrayed a cross-section of life in the imperial city during the reign of Caesar Augustus with a real sense of immediacy; and Rosemary Stucliff, the English author, added another panel to her fictional studies of ancient Britain with her colorful, carefully wrought *The Lantern Bearers,* which deals with the struggle to keep civilization alive in that lonely island despite the Jutes and Saxons.

So crowded was the fiction field in 1959 (with something for everyone, including numerous new titles for the beginning reader), that it was difficult to see the peaks among the foothills. However, Mary Norton's third volume in her Borrowers series, *The Borrowers Afloat,* proved her to be a consistent and gifted performer in the great tradition of fantasy. Gene Inyart's first book, *The Tent Under the Spider Tree,* a deceptively simple, everyday story of three little girls, revealed a fresh talent, suggestive in its perceptiveness and detail of Elizabeth Enright.

Books for teen-age girls were legion, but far too many were merely trite reworkings of old themes of adolescent literature. However, Beverly Cleary (*Jean and Johnny*), Elisabeth Ogilvie (*How Wide the Heart*), the new author Elizabeth Allen (*The In-Between*), the ever-dependable Mary Stolz (*Some Merry-Go-Round Music*), and Laura Rendina (*Trudi*), among others, proved that the teen-age novel can say something worthwhile to girls and say it well.

ELLEN LEWIS BUELL,
Editor of Children's Books,
"The New York Times Book Review."

CHILE. Lying along the southwest coast of South America, Chile is a long (2,653 miles), narrow (average width, 109 miles) land wedged between the Pacific Ocean and the continental divide high in the Andes Mountains. The fertile agricultural and commercial section around Santiago, the capital, is Chile's "Mediterranean" region. To the north lies "desert Chile," comprising the rainless provinces of Tarapacá, Antofagasta, and Atacama, which is a source of natural sodium nitrates and copper. South-central Chile (extending from Concepción to Llanquihue provinces) is a lake, forest, and farming region, which gives way to the broken territories of Chiloé, Aysén, and Magallanes provinces of the cold southern frontier. Chile's area totals 286,396 square miles, not including the Antarctic sector which it claims (longitude 53°–90°W.) and strategic islands such as Juan Fernández and Easter, respectively about 440 and 2,300 miles from Chile in the Pacific. Chile also commands the strategic Strait of Magellan.

Population.—The 1958 population estimate was 7,298,000, less than 6% of whom live in "desert Chile" and only 3% in the extreme south. Principal cities (with 1954 est. pop.) are Santiago (1,546,884), Valparaíso (247,212), Viña del Mar (102,206), Concepción (134,549), Antofagasta (62,272 in 1952), and Punta Arenas (34,440 in 1952). Most Chileans are of mixed Indian and Spanish blood. For 1956 the birth rate was listed at 35.4 per 1,000 inhabitants; death rate, 11.5; and infant mortality, 113 per 1,000 live births.

Government.—Under the 1925 constitution, Chile is organized as a unitary state with separation of powers (executive, legislative, and judicial). Freedom of the press and of association help make Chile one of the few practicing democracies in Latin America. The president (Jorge Alessandri, inaugurated Nov. 3, 1958) is elected by popular vote for a 6-year term and may not be re-elected immediately. The 45 senators (5 from each of 9 groups of provinces) are elected directly for 8-year terms (one half of the Senate is renewed every 4 years); the 147 deputies of the lower chamber (1 for each 45,000 persons) serve 4-year terms. As a consequence of proportional representation and a multiparty system, the president must seek coalition support in the Congress. The 13-justice Supreme Court has the constitutional power of "judicial review."

Religion and Education.—Religious affiliation is as follows (1952 census): Roman Catholic, 5,313,473; Protestant, 240,856; Jewish, 11,496. State support of Roman Catholicism ceased with the 1925 constitutional reform, but papal representatives and clergy figure prominently in national life and ceremonial functions. Freedom of worship, however, is observed.

Between the ages of 7 and 15, education is free and compulsory; basic literacy has now spread to nearly 80% of the population. As of 1954 the public and private primary schools enrolled 943,000 pupils, and secondary institutions, 115,500. The University of Chile in Santiago had 8,329 students; the Catholic University at Santiago, 2,753. Other institutions of higher education are the Universidad Técnica "Federico Santa María" and the Catholic University, both at Valparaíso; the Universidad Técnica del Estado, the University of Concepción, and the University Austral at Valdivia (founded in 1954).

Finance.—During the first 4 months of 1959 the means of payment increased 26.9 billion pesos, or 9.5%, compared with 7.9% for the corresponding period of 1958. Central Bank gold and foreign exchange holdings rose from $58.8 million at the end of 1958 to $149.0 million by September 1959. Total revenue for 1958 was 378 billion pesos (up from 286 billion in 1957); expenditures amounted to 413 billion pesos (1957, 317 billion). The 1959 budget programed income of nearly 390 billion pesos and expenditures of over 407 billion (including 80.5 billion for education, 93.5 billion for direct military establishment, 44 billion for public works, 41 billion for health and social welfare, 5 billion for agriculture, and 0.4 billion for the Ministry of Mines).

In January 1959, Chile converted to a single-rate "free" exchange for all transactions (1,053 pesos to the U.S. dollar during most of 1959). By statute, a new monetary unit, the *escudo*, is to replace the badly depreciated peso in 1960; one *escudo* is the equivalent of 1,000 pesos. The president's proposed budget for 1960 was 644.7 million *escudos*.

The cost-of-living index (1953 = 100) moved from 870 for January 1959 to 1,110 by August. Food prices especially were up. This alarming increase of 29% (the entire rise for 1958 was 33%; for 1957, 17%) caused President Alessandri to reinstate some of the price controls which were abolished in November 1958.

Transportation.—Chilean railways (totaling 5,500 miles of 7 different gauges) carried 2.15 billion ton-kilometers of freight in 1958 (2.22 billion in 1957); air cargo totaled 9.55 million ton-kilometers (1957, 11.28 million). Air passenger-kilometers flown amounted to 386.7 million (1957, 438.2 million). Five Chilean and 7 foreign airlines served the country in 1958. Surfaced highways (1954) totaled 10,895 miles, and there were 16,320 miles of graded and drained roads; vehicle registrations for 1957 totaled 53,913 passenger autos, 54,830 trucks, and 4,417 buses.

Mineral Production.—A firm international copper market (33 cents per pound as of November 1959) and the modification of Chile's foreign trade regulations stimulated copper production in 1959 (amounting to 251,900 metric tons in the first 6 months, well ahead of 1958's total of 439,200 metric tons). Nitrate production in 1958 totaled 1,280,065 metric tons (1957, 1,309,554) and early figures for 1959 showed a continued decline of some 9%. Iron ore (production in 1958, 3,633,355 metric tons; 1957, 2,679,663) may soon replace nitrate as the second highest foreign exchange earner after copper; exports of iron ore in the first half of 1959 totaled 1.5 million metric tons (25% over the 1958 period) with the United States, Germany, and Japan the chief buyers. Port and rail modernization contributed by lowering marketing costs. Crude petroleum production (885,198 cubic meters in 1958; 689,499 in 1957) also has been rising. The 1959 yield is expected to surpass 1 million cubic meters. Coal production declined further to 2 million tons (1957, 2.1 million).

Agricultural and Industrial Production.—Meat production in 1958 fell to 77,280 metric tons (1957, 90,360), necessitating heavier shipments from Argentina. Subsistence crops produced a bumper harvest in 1958. Wheat production totaled 1,257,300 metric tons, compared with 988,430 in 1957; potatoes, 857,900 metric tons (1957, 635,510); and corn 118,500 metric tons (1957, 100,030). The expanding beet sugar industry produced 235,600 metric tons in 1958, but 85% of the annual consumption must still be imported. Total farm output has risen some 40% (comparing 1935–39 and 1956–57 averages), but because of population increases the per capita output has declined about 12%. Furthermore, frost and storm damage in 1959 probably reduced yields by 20% to 25%.

The depressed commercial situation was reflected in 1958 industrial statistics: pig iron, 304,800 metric tons (1957, 381,600); cotton fabric, 44 million meters (1957, 47 million). The construction picture was poor; cement production remained the same as for 1957 (727,200 metric tons). The business outlook for 1959 was for a modest upturn in most sectors.

Foreign Trade.—Exports in 1958 were valued at $386 million (1957, $455 million). Copper was the principal foreign exchange earner; mining products as a whole accounted for nearly 75% of the total. Imports in 1958 totaled $414 million (1957, $441 million). Leading import items are machinery, vehicles (and parts), chemicals, agricultural products (Chile imports 25% of her food), and various manufactures.

Exports to the United States dropped to $128 million in 1958, the lowest level since 1947 ($196 million in 1957). Purchases from the United States also were reduced, to $147 million ($199 million in 1957).

The drastic system of advance deposits against imports was partially replaced by special surcharges ranging from 10% to 150% of the value of the merchandise. Chile is becoming an important regional supplier of paper products; receipts for exports (27,559 tons) in the fiscal year 1959 amounted to $4.3 million.

Principal Events, 1959.—Relatively stagnant development, coupled with a serious inflationary spi-

ral, continues to be Chile's primary economic problem. Urban labor vigorously opposed the government's program of austerity which gave wage increases chiefly to the unorganized, long-suffering agricultural worker. Sharp price increases—for example, in gasoline, bread, potatoes, and bus and rail fares—evoked more protests. Nevertheless, a coalition of Conservative, Liberal, and Radical Party congressmen in May voted President Alessandri special powers for one year, including authority to direct the economy and reorganize the bureaucracy without referral to Congress. The powers were sought after opponents succeeded in crippling by amendment the administration's Law of Economic Consolidation (final version promulgated April 6 with over 100 provisions vetoed).

Finance Minister Roberto Vergara, by personal negotiations abroad, arranged $282 million in loans and credits (from the United States, $132 million; West Germany, $100 million; France, $50 million).

"El Salvador," the new, high-efficiency Anaconda Company's copper mine 7,800 feet up in the Andean foothills, began full operations in July. Nearby Potrerillos, after having produced 1,850,000 tons of copper during the last 32 years, was reduced to refining only. The new works is producing at the rate of 100,000 tons of copper annually (from 375 million tons of 1.5%-or-better proven reserves), or 60,000 tons more than was being secured from Potrerillos.

In August, economic nationalists attacked the requirements of the International Monetary Fund (and the finance minister for accepting them) for an additional $8.1 million support to Chile's stabilization program. The prominent Christian Democrat, Senator Eduardo Frei Montalva, denounced what he called the "subjection of the Chilean economy"; the conservative *El Diario Ilustrado* newspaper claimed the national sovereignty had been "invaded."

The Popular Action Front (FRAP), a combination of extreme left-wing groups including the growing Communist Party (legalized Aug. 5, 1958, after a ten-year ban) had 9 seats in the Senate and 21 in the Chamber of Deputies in 1959. FRAP factions, however, are frequently at odds over specific tactics. In July 1959, after a visit to Communist China (and guidance from Mao Tse-tung), Communist Secretary General Luis Corvalán proclaimed Cuba's "march with the bourgeoisie" as the correct example. Trotskyite Socialists (for a pure working class movement), disapproving of such fraternization with the bourgeoisie and rejecting Peking-Moscow domination, placed themselves in the neutralist camp.

CHINA, People's Republic of.[1] A Communist-ruled republic of Asia, the largest in population and third largest in area of the countries of the world. Estimated area, 3,768,727 square miles; pop. (est. 1957), 640 million, with an estimated rate of increase of about 2% per year. Han Chinese comprise about 94% of the population. Minority groups include the Chuang, in the southeast (about 6.5 million); the Hui, a Moslem people, in the northwest (3.5 million); and Uigur, Yi, Tibetan, Miao, Manchu, Mongolian, and Korean groups. Peking (formerly Peiping, pop. 1953 census, 2,768,149) is the capital; Shanghai (6,204,417) is the largest city; and Tientsin (2,693,831) the third largest city. Other large cities are Mukden (2,299,900), Chungking (1,772,500), Canton (1,598,900), Wuhan (1,427,300), Harbin (1,163,000), and Nanking (1,091,600). The urban population in 1956 was about 14% of the total (about 11% in 1950).

Government.—The People's Republic of China was inaugurated on Oct. 1, 1949. The constitution adopted in 1954 terms the republic "a people's democratic state led by the working class." The National People's Congress is designated as the supreme organ of state power, although in practice it serves merely to ratify decisions taken by the Communist Party leadership. The Congress has some 1,200 members elected every four years by provincial congresses, and meets once a year. Acting for the Congress between sessions is the Standing Committee, a working body of 79 members.

The chief executive officer and titular head of the state is the chairman of the republic, elected by the National People's Congress. He serves also as commander in chief of the armed forces and chairman of the National Defense Council. Lui Shao-ch'i, a leading Communist theoretician, was elected chairman of the republic on April 27, 1959, succeeding Mao Tse-tung. Mao, a principal figure of the Chinese Communist movement since the 1920's, retained his position as leader of the Communist Party. The executive body and highest administrative organ of government is the State Council, or cabinet, consisting of about 40 ministries. Chou En-lai, premier of the republic since its inception, heads the State Council, and Marshal Ch'en Yi serves as foreign minister. There is also a Supreme State Conference, a sort of inner cabinet of the different branches of government, which can be summoned by the chairman of the republic when he sees fit. Under the central government are the 21 provinces, 3 special municipalities (Peking, Shanghai, and Tientsin), and 5 autonomous regions (Tibet, Inner Mongolia, Sinkiang, Ningsia, and Kwangsi Chuang).

Dominant political power is wielded by the Communist Party. A few non-Communists parties participate in the government, but their role is negligible. At the head of the Communist Party is the Politburo, consisting of Mao Tse-tung (chairman), Liu Shao-ch'i, Chou En-lai, Marshal Chu Teh, and other top political and military leaders. The Politburo is elected by the Communist Party Central Committee, consisting of about 97 members and an equal number of alternates. There is also a National Party Congress, which meets once a year, and a National Party Conference, which is an extension of the Central Committee and deals with party matters between meetings of the congress. Communist Party power is exercised through the control of key posts in the government and the army, industrial and trade enterprises, trade unions, youth and women's groups, and communes. Communist Party membership is estimated at about 12.7 million.

Religion.—Confucianism, though lacking a formal church organization, has been an important determinant of the Chinese way of life. Taoism and Buddhism are the other principal faiths. There are a few million Moslems, mainly in the northwest, and relatively small Roman Catholic and Protestant minorities. Communist theory is essentially antireligious. The Communist emphasis on group rather than family life, the emancipation of women, and other reforms have considerably altered the social basis of traditional religious practices (such as veneration of ancestors). The Peking regime has severely curtailed Christian missions in China and persecuted missionaries as agents of Western imperialism.

Education.—The Peking government in 1959 claimed to have established, during its decade of rule, about a million schools and other educational institutions, in which some 200 million persons received education. Primary education begins at the age of 7 and lasts 5 years. According to Peking, 85% of school-age children attended school in 1958. About 31 million children received preschool education and 86 million attended primary schools. In 1959, 12 million children were in middle schools (87% of the age group), and 815,000 full-time students attended China's 815 higher institutions. Some 60 million persons reportedly attended literacy classes in 1958, and 30 million were in spare-time schools. Technical and engineering training is emphasized, and students on the higher levels perform a few months of manual labor each year. Communist indoctrination proceeds on all levels.

Finance.—The draft budget for 1958 balanced revenue and expenditure at 33,198 million yuan (2.343 yuan equal U.S.$1 at the official rate). On Dec. 17, 1958, the Communist Party reported that government revenue for 1958 had exceeded the budget estimate by 42%, or about 14 billion yuan. The 1959 budget adopted by the National People's Congress on April 28, 1959, balanced revenue and expenditure at 52,010 million yuan. Defense outlays for 1959 were set at 5.8 billion yuan, a rise of 16% over 1958. (It is widely believed that many defense items are budgeted under other headings.) Projected outlays on economic construction for 1959 comprised 61% of anticipated

[1] Data given in this article, unless otherwise specified, pertain to the Chinese mainland, or Communist China. For information on Nationalist China, see TAIWAN.

UPI

expenditure; outlays on social services, culture, and education, 11%. As in previous years, the emphasis in economic expenditure was on heavy industry development. On Feb. 7, 1959, a Sino-Soviet agreement signed in Moscow provided for Soviet financial and technical aid to China aggregating some 5 billion rubles in the next 8 years.

Industry.—Having substantially achieved the goals of the First Five-Year Plan (1953–57)—socialist transformation of production and establishment of a heavy industry base for industrialization—China inaugurated the Second Five-Year Plan with redoubled efforts in 1958, the year of "the great leap forward." The entire population—almost a fourth of the world total—was mobilized by propaganda and emulation campaigns, promises of plenty and threats against laggards, under the single slogan of increasing production. Peasants became part-time producers of pig iron in thousands of back-yard furnaces, children and old people gathered scrap for iron and dung for fertilizer, urban workers gave up their holidays. The results of this effort, as initially reported by Peking, seemed to confound all orthodox theories of economic growth. Overall industrial and agricultural output was alleged to have risen by 65%. Steel production was said to have doubled, and output of food grains to have climbed by over 100%.

Reports emanating from unofficial sources in 1959, however, conflicted strangely with official claims of success. Food shortages were said to exist in the cities, Chinese exports to Southeast Asian markets were dwindling, and discontent was reported widespread in the communes. On Aug. 26, 1959, the Peking regime announced that its earlier claims for 1958 had been grossly overstated and that target levels for 1959 would be considerably below previously stated goals. Of the 11,080,000 metric tons of crude steel originally claimed to have been produced in 1958, only about 8 million was termed usable for industrial purposes, and the Peking planners decided to abandon the makeshift rural furnaces as uneconomical. The 1959 target for steel was reduced from 18 million to 12 million metric tons, and the coal target from 380 million to 335 million, or about 24% over claimed output for 1958.

CHINA: PRODUCTION OF MAJOR INDUSTRIAL ITEMS[1]
(Tons shown are metric tons.)

Item and unit	1952	1956	1957	1958
Electricity (billion kw.-hr.)	7.3	16.6	19.0	27.5
Coal (million tons)	63.5	105.9	123.9	270.0
Petroleum (million tons)	0.44	1.16	1.44	2.23
Steel (million tons)	1.35	4.47	5.35	8.00[2]
Chemical fertilizer (million tons)	0.19	0.66	0.75	0.81[2]
Machine tools (1,000 units)	13.7	26.0	29.1	90.0
Cement (million tons)	2.9	6.4	6.7	10.0
Timber (million cubic meters)	10.0	24.5	29.2	34.5
Cotton yarn (millon bales[3])	3.6	5.2	4.6	6.1[2]

Paper, all types (million tons)	0.54	...	1.20	1.60

[1] Data given are official Peking figures, and their reliability is regarded by many experts as questionable. This is particularly true for 1958, since the Peking government itself stated in August 1959 that many of its figures for 1958 had been greatly overstated. [2] Revised downward from earlier claims. [3] Of 400 pounds each. (Chief sources: *Economic Survey of Asia and the Far East*, United Nations; and New York *Times* reports of official Peking announcements.)

Despite this deflation of success claims for "the great leap forward," it appeared that gains in many industries had been substantial, and the Communist leaders decided to continue the all-out drive toward industrialization. On Aug. 28, 1959, Peking reported that steel production for the first half of 1959 had totaled 5.3 million metric tons, a rise of 65% over the like period of 1958; pig iron, 9.5 million (up 160%); coal, 174 million (up over 100%); electricity, 18.4 billion kw.-hr. (up 55%); and cotton yarn, 4.1 million bales (up 46%).

Minerals.—Mineral surveys conducted under the First Five-Year Plan revealed China to have among the world's largest deposits of tungsten, antimony, tin, iron ore, copper, lead, aluminum, and coal. In the case of iron ore, however, much of the reserves is of low grade. Chinese petroleum production, estimated at 15 million barrels in 1958, is considerably below needs. Chief sources are the shale mines at Fushun and the Yümen oil fields in Kansu; newly opened fields are chiefly those at Karamai and Tushantze in Sinkiang, the Tsaidam basin in Tsinghai, and the Nanchung area of central Szechwan. Output of tin concentrates in 1958 was estimated at 18,200 metric tons, tungsten ore (1957), 12,000; and antimony ore (1957), 15,000. China also produces molybdenum concentrate, mercury, bauxite, magnesite, pyrite, gypsum, and phosphate.

Agriculture.—The revolutionary transformation of the Chinese countryside began with the abolition of landlordism, proceeded with the organizing of the peasant tillers into cooperatives and collectives, and reached its most extreme form thus far with the introduction of the communes in 1958. In the cooperatives and collectives the traditional peasant household had been largely effaced as a producing unit; in the communes it has further lost many of its functions as a consuming and child-rearing entity.

Organization of the communes began on an experimental basis in July 1958, and was accelerated following a Communist Party decision of Aug. 29, 1958. One year later Peking reported that 99% of peasant families had been organized in some 24,000 rural communes averaging about 5,000 households each. The communes handle not only economic and social matters—agriculture, industry, trade, education, cultural affairs, propaganda, and military training—but also local government functions. The communal organization generally descends from a top-level administrative committee, which formulates general policy, to intermediate administrative districts (production brigades), and finally to production teams. Many communes were still in the formative stage in 1959 and differed in size, details of organization, modes of payment to members, and in other respects.

The objective of the communes is to obtain maximum advantage of China's greatest resource, labor power. Communal nurseries, kitchens, mess halls, and tailor shops release women for work in field and factory. Optimum labor mobility is attained by the shifting of work teams, as needed, from harvesting to road construction, from land improvement projects to communal factories and

shops. The tightly knit communal life makes possible a concentration of propaganda and the strict control of the activities of members. The communal apparatus facilitates crop deliveries to the state and makes for more efficient centralized planning.

Peking's initial claims for success of "the great leap forward" in agriculture were as extravagant as in industry and had to be revised downward equally drastically. The figure for 1958 output of food grains (paddy, wheat, coarse grains, and potatoes), initially announced at 375 million metric tons (185 million in 1957), was revised to 250 million; and the 1959 target was reduced from 525 million to 275 million. Cotton production was revised downward from 3.3 million metric tons to 2.1 million (1.64 million in 1957), and the 1959 target was reduced from 5 million to 2.3 million. Other revised figures on 1958 yields were: soybeans, 10.45 million metric tons; peanuts, 2.18 million; flue-cured tobacco, 379,000; and jute and kenaf, 309,000.

Activities in irrigation, reforestation, water conservation, and reclamation were intensified in 1958. Between September 1957 and October 1958 a reported 32 million hectares were placed under irrigation, raising total irrigated area to 66.6 million hectares, or 59.5% of cultivated area. Of the 11 major water-conservation projects under way, the largest is the Sanmen Gorge project in Honan Province, which will have a power capacity of 1.1 million kw., and is expected to eliminate flood dangers in the lower Yellow River. Four irrigation and canal systems along the Yellow River in northern China came into operation in 1958.

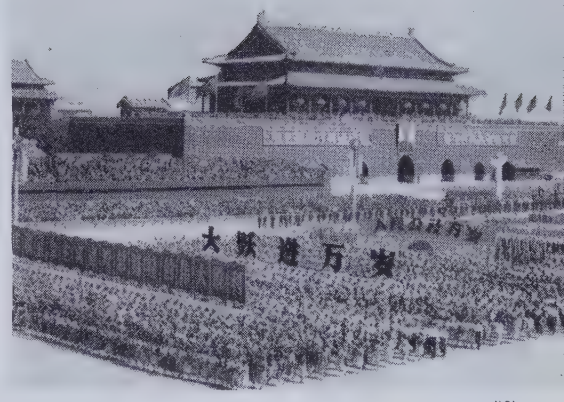
Foreign Trade.—China's foreign trade in 1958 was about 14% greater than in 1957. Exports in 1958 were estimated at 6,235 million yuan; imports, 5,312 million. During the First Five-Year Plan approximately 75% of China's trade was with other Communist countries, 16% with non-Communist Asian and African countries, and 9% with Western nations. Over half of China's trade in the 1953–57 period was with the Soviet Union. In 1958, imports from the USSR totaled about 2,437 million rubles (up 12% from 1957); exports, 3,632 million (up 23%). China's chief imports from the USSR are machinery and equipment, petroleum products, and metals and products; chief exports: food and agricultural products, textiles, and metal ores and concentrates. In addition to China's traditional export items (foodstuffs, minerals, raw silk, tung oil, hemp, and other agricultural products), exports recently appearing in Asian and other markets have included coal, cotton, rubber tires, steel products, chemicals, textiles, machine tools, and other manufactures.

Transportation and Communications.—Under the First Five-Year Plan, railway mileage increased about a fifth. In 1958 over 1,300 miles of new track was reported to have been laid, bringing total mileage open to traffic to about 20,000. Inland waterways provide an important means of transport. In 1958 about 6,200 miles were added to inland shipping routes, and work commenced on dredging the Grand Canal, silted up for over 100 years (see CANALS). Two major roads to Tibet were completed during the First Five-Year Plan, and the target figure of 6,214 miles of new highway construction was reported to have been greatly exceeded. China had 18 domestic airlines in operation in 1957.

M. J. G.

THE YEAR 1959 IN COMMUNIST CHINA

Economic Developments. *Production.*—On Aug. 26, 1959, Communist China amazed the world by announcing that the production figures for 1958, issued earlier in 1959, had been greatly exaggerated. Peking now declared that the 1958 grain output, originally given as 375 million metric tons, was in fact only 250 million tons; steel production, previously announced as 11,080,000 tons, included only 8 million tons of industrial quality; and cotton production, reported to total 3,350,000 tons, actually amounted to 2,100,000 tons. The revision of the production figures for 1958 was accompanied by a lowering of the targets for 1959. Thus the goal for grain output in 1959 was reduced to 275 million metric tons, or little more than half the figure set earlier. Similarly, the 1959 steel goal was reduced from 18 million to 12 million tons, that of cotton from 5,000,000 to 2,310,000 tons, and that of coal from 380 million to 335 million tons.



UPI

A massive parade of civilians on October 1 opens the celebration in Peking of the 10th year of the Communist regime.

The Communist government blamed the errors in 1958 agricultural figures on the haste with which unusually large crops had been harvested, and insisted that despite the deflated figures the overall gains in 1958 constituted the promised "big leap forward." Nevertheless, the impact of the revelations was felt by the peoples of the underdeveloped countries of Asia. The Communist magic formula for rapid economic development lost much of its appeal. Of equal significance was the admission by Peking that the steel produced in the small back-yard furnaces which had been built all over the country was suited only to rural use. This process of manufacture, hailed just a year before as an ingenious invention, was now abandoned as a national enterprise.

The acknowledgment of statistical exaggeration and the downward revision of production goals, while indicating the difficulties which Peking had been encountering, should not be taken as signs of failure in the Communist economic plans. According to Premier Chou En-lai's report of August 28, 1959, production increases for the first half of the year were substantial. The output of steel rose by 65% over that of the first half of 1958; production of iron, by 160%; that of coal, by over 100%; that of cotton yarn, by 46%; that of electricity, by 55%; and the number of metal-cutting tools, by 100%. While the new figures should be received with reserve, it would seem that Peking was still in a position to fulfill the goals established for the first two years of the Second Five-Year Plan (1958–62).

Agricultural Development.—Among the difficulties which caused the Chinese Communists to lower their 1959 target for grain production were natural disasters. In April and May, heavy rains inundated wide areas of Kiangsu, Anhwei, Hupei, and Honan provinces. The worst flood occurred in June in Kwangtung Province, where 2 million acres of arable land were ruined and 2 million per-

ELLINWOOD IN THE TUCSON (ARIZ.) DAILY STAR

"Home Wrecker"

sons lost their homes. In the same month, locusts caused considerable damage to the crops of five provinces of northern and central China. Later, 50 million acres in Manchuria, the center, and the southwest were affected by drought. As Chou En-lai admitted, however, such disasters were only part of the reason for the failure to meet agricultural production goals. A major cause was the adoption of the theory that intensive cultivation would make it possible to grow larger crops on smaller acreages. Such crops could be produced only with the machinery, chemical fertilizers, and other modern aids which China lacked.

The net result was a shortage of food that was felt especially in the cities. It had long been known that the exports to Soviet bloc countries in exchange for raw materials and to neutralist Asian and African nations as a means of extending Peking's influence were draining China's food supplies. Now the newly organized communes tended to aggravate the situation. Confusion arising from the revolutionary changes in the rural districts interfered with the distribution system, and the communes themselves were unwilling to sacrifice food for the maintenance of the crowded cities.

Communes.—In the early months of 1959 the Chinese Communist authorities seriously proposed industrialization of the communes as a means of integrating agriculture and industry. Their enthusiasm was, however, soon dampened by Soviet criticism and by the discontent of the Chinese peasants with the regimentation of communal life. In July, steps were taken to ease the regulations of the communes: a government directive gave permission to families to cook their own food and eat it in privacy, and stated that in future the use of mess halls would be voluntary.

Political Developments. *Communist Leadership.*—On April 27, 1959, the 2d National People's Congress elected Liu Shao-ch'i chairman of the people's republic to succeed Mao Tse-tung, who had expressed a desire to step down. A leading Communist theoretician, Liu had long been considered second in the line of leadership. His replacing Mao as chief executive did not, however, affect the latter's position as supreme leader. Mao retained the powerful post of chairman of the Politburo of the Chinese Communist Party, and in that capacity remained the dominant figure in the country. Nor did his popularity suffer any decline: at the celebration of Communist China's 10th anniversary on October 1, he received enthusiastic acclaim from his followers.

Administrative Shake-up.—On September 17, Peking announced a number of changes in major offices. Marshal Lin Piao was named to replace Marshal P'eng Teh-huai as minister of national defense, and Marshal Lo Jui-ch'ing to succeed Gen. Huang K'e-ch'eng as army chief of staff. In addition, Wang Chia-hsiang and Chang Wen-t'ien were relieved of their positions as deputy foreign ministers. The military shift was believed to reflect the growing dissatisfaction of the armed forces with the extensive employment of soldiers in nonmilitary tasks in the communes. The appointment of Marshal Lo, who had been minister of public security for 10 years, signified the desire of the Communist government to tighten its control over the army.

The shift of key officials did not, however, lead to the purge which had been predicted in some quarters. It is true that an article in an August issue of *Hongqi,* ideological journal of the Chinese Communist Party, severely attacked "rightist opportunists" for "criminal activity" against socialist construction by "disseminating . . . pessimism among the masses." But this was an exhortation to the people to do their best to meet production goals rather than a call for a purge. On December 4 it was announced that 25 rightists purged in 1957–58 had been pardoned, together with 20 former Nationalists, 2 leaders under the Japanese, and Henry Pu Yi, former emperor of China and of Manchukuo.

Tibetan Revolt.—Since the Chinese Communists first assumed control over Tibet in 1950, their attempts at socialization had been resisted by Tibetans. On March, 10, 1959, when the Dalai Lama was invited to attend a cultural show at the Chinese headquarters in Lhasa, thousands of Tibetans, fearing that harm might be done to their leader, gathered around Norbulingka Palace to prevent him from attending the function. Simultaneously, large crowds demonstrated in Lhasa against Chinese Communist rule. On March 19, the Tibetan Army clashed with Chinese Communist forces, which brought machine guns and artillery into action. The rebels were soon put to rout, and the Chinese took 4,000 Tibetan prisoners. On March 28, Peking ordered the dissolution of the local government of Tibet and transferred its functions to the Preparatory Committee for the Tibet Autonomous Region, which was henceforth to be headed by the Panchen Lama rather than by the Dalai Lama.

Meanwhile, the Dalai Lama fled to India, where he was granted political asylum on March 31. In a statement issued at Tezpur, Assam, on April 18, he declared that Communist China had violated the Sino-Tibetan agreement of 1951, especially the provisions concerning noninterference with the Tibetan religion. On June 20, he demanded the restoration of self-government in Tibet and the withdrawal of Chinese administrators and troops. Failing to secure Indian intervention, he appealed on September 9 to the United Nations. On October 21, the U.N. General Assembly passed a resolution expressing grave concern "at reports . . . that the fundamental human rights and freedoms of the people of Tibet have been forcibly denied them" and calling "for respect . . . for their distinctive cultural and religious life." Two days later Peking denounced the resolution as illegal interference in its domestic affairs. (See also Tibet.)

Foreign Relations. *Asia and Africa.*—Communist China's prestige in Asia suffered in 1959 when the Tibetan revolt broke out. The suppression of the revolt provoked criticism in such neutralist countries as Burma, Cambodia, and Indonesia. Nevertheless, Indonesia and Communist China managed to reach an understanding (October 11) whereby each country would support the other's claim to Netherlands New Guinea and Taiwan, respectively. (See also INDONESIA.)

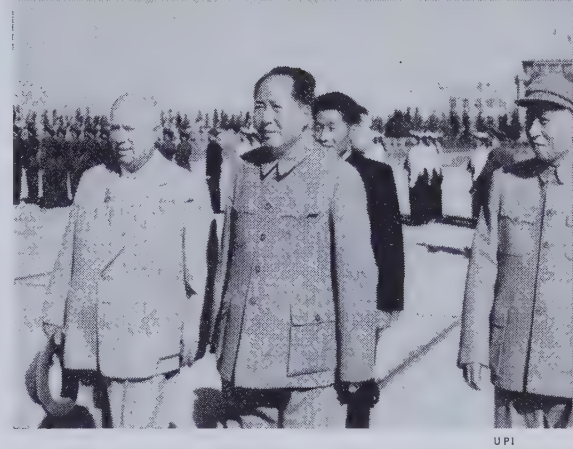
In the Middle East, Communist China's efforts to extend its influence were opposed by the United Arab Republic (UAR). On October 3, the UAR charged the Chinese with delaying the cables sent by its embassy in Peking. Meanwhile, the Cairo press embarked on a campaign of warning the Arab world against Peking's subversive activities.

It was with India that Communist China's foreign relations took the most serious turn. The Indian grant of political asylum to the Dalai Lama was bitterly resented in Peking, and the press, radio, and members of the National People's Congress joined in attacking "Indian expansionists" who supported the Tibetan revolt. When the Indian press reciprocated, a cold war developed between the two Asian countries.

Tensions were soon aggravated by border incidents. Speaking in Parliament on August 28, Prime Minister Jawaharlal Nehru charged that Chinese Communist forces had entered Indian territory at two places in the North-East Frontier Agency, Assam, and stated that India would be obliged to defend its borders. Peking's position was that it was India that had encroached on Chinese territory. In a note of September 8, Chou En-lai maintained that the McMahon Line, which the Indian government considered had been the legal boundary between Tibet and India since 1914, was "never agreed to by any Chinese central government." The Chinese territorial claims were rejected by Nehru in a note of September 26. On October 21, Chinese and Indian forces clashed in the Ladakh section of Kashmir; 9 Indians were killed, and 7 others were captured by the Chinese. On October 24, Peking offered to free the 7 men with 3 others captured earlier, but in a statement issued two days later renewed and enlarged its claims to Indian territory. In a letter to Nehru on November 7, Chou proposed that both sides withdraw their troops a certain distance in the disputed areas, but his proposal would still leave Chinese forces in Ladakh. Nehru's reply, published on November 20, proposed instead that the Chinese withdraw from all Indian territory and that both sides discontinue forward patrols. Meanwhile, on November 14, the 10 prisoners were returned to India. (See also INDIA.)

Soviet Union.—Relations between Communist China and the Soviet Union showed signs of strain in 1959. The rapid organization of the Chinese communes met with outspoken criticism from the Soviet leaders, who were anxious to maintain Soviet pre-eminence in Communist ideology. On January 12, First Deputy Premier Anastas I. Mikoyan remarked that Russia had tried communes in 1918–19, but had soon discovered that they were unworkable. Addressing the 21st Congress of the Soviet Communist Party on January 27, Premier Nikita S. Khrushchev declared that there were no short cuts to communism, but that each country must pass through a socialist stage in which incentive pay would be necessary for the rapid development of production. The Chinese Communists acquiesced in the Soviet assertion of ideological leadership, but they continued their communes after making some modifications.

A more serious threat to the solidarity of Moscow and Peking arose from their divergent policies toward the United States. It was apparently to keep Communist China in line with his policy of peaceful coexistence with the United States that Khrushchev flew to Peking on September 30. Chou En-lai commended the Soviet premier on his successful visit to the United States, but while Khrushchev and Mao Tse-tung discussed the relaxation of international tension, the official Communist organ *Jenmin Jihpao* carried an article by Foreign Minister Ch'en Yi that called on all peoples to wage an unrelenting struggle against "American imperialism."



UPI

Soviet Premier Khrushchev (left) is accompanied by Mao Tse-tung (center), leader of the Chinese Communist Party, and Lui Shao-ch'i (right), chairman of the Chinese People's Republic, as he leaves Peking on October 4 after attending 10th anniversary festivities of the Chinese government.

Khrushchev left Peking on October 4 without issuing a communiqué, and it was not known whether he had reached any agreement with Mao. But if Communist China did not find the maintenance of the status quo and the relaxation of tension attractive, there was no sign that it would break with the USSR. Ideology, the need for a common front against the West, and Chinese reliance on Soviet aid required cooperation between the two countries.

United States.—To the Chinese Communists the United States remained the implacable foe of their foreign policy aims. Washington stood in the way of their conquest of Taiwan, sponsored embargoes against trade with mainland China, and frustrated Communist schemes in Korea, Vietnam, and Laos. If Peking played down its hostility toward the United States after Khrushchev's visit, this was a temporary measure to save the Soviet premier embarrassment rather than a radical change of policy. Peking was too deeply committed to its

Members of a people's commune near Peking are exhorted to greater effort by a speaker who reads them a communiqué and resolution of the Communist Party's Central Committee.

CHIROPRACTIC. Chiropractic—the diagnosis of human ailments and the treatment of these ailments by the adjustment of the articulations (joints) and the manipulation of the adjacent tissues, and the use, as indicated, of clinical nutrition, psychotherapy, and physiotherapy—is classified by the federal government as one of the four major healing professions. Chiropractic care is offered by some 25,000 practitioners in the United States and abroad.

The 64th anniversary convention of the National Chiropractic Association (NCA) was held in Chicago, July 5–10, 1959. National councils on roentgenology, public health, hospitals and sanitaria, psychotherapy, research, education, and physiotherapy, as well as the National Auxiliary, met at the same time, with some 1,200 persons attending. A new Council on Chiropractic Orthopedics, for research in basic procedures, was established. In addition, convention highlights included a series of symposia on important developments in diagnostic procedure, adjusting technic, X-ray interpretation, poliomyelitis treatment, physiotherapeutic practices, and public health problems.

Among the important NCA activities during 1959 were: (1) the establishment of several new departments to cover insurance relations, public relations, industrial relations, professional relations, and labor relations; (2) vocational guidance exhibits at the national conventions of the American Association of Junior Colleges and the American Personnel and Guidance Association; (3) the appropriation by the House of Delegates of $100,000 per year to be devoted to education and research through the eight chiropractic colleges accredited by the National Council on Education; (4) the first examinations and certification of qualified chiropractic roentgenologists by the Board of Certification; (5) cooperating with President Eisenhower's Council on Youth Fitness by administering Kraus-Weber fitness tests to American school children; (6) extending grants-in-aid to seven accredited chiropractic colleges in the United States through the new Foundation for Accredited Chiropractic Education (the National Chiropractic Insurance Company contributed the first $50,000 to this program); and (7) conducting district educational seminars to acquaint all doctors of chiropractic with the latest scientific developments in the field. Also important in 1959 was the publication of *Medicine and Chiropractic* by Dr. Clarence Weiant, dean of the Chiropractic Institute of New York, in association with Dr. Sol Goldschmidt, a practicing chiropractor.

The National Chiropractic Association has headquarters at the National Building, Webster City, Iowa.

CHRISTIAN SCIENCE. Increased emphasis on overseas activities highlighted progress of The Mother Church, The First Church of Christ, Scientist, in Boston, Mass., during 1959.

Colorful new quarterly editions of the *Herald of Christian Science* were published in Danish, Dutch, Italian, Norwegian, Portuguese, Spanish, and Swedish. Another important development was the production of the full-length Technicolor motion picture, *The Mother Church in Action.* German, French, and Spanish versions of the film were also produced.

Special conferences for military personnel in Korea, Japan, and Germany—as well as Christian Science lectures and informal talks in some eight overseas areas—were arranged by Christian Science Activities for the Armed Forces. Annual (instead of biennial) visits to the Middle East, South Asia, and the Far East were made by Christian Science lecturers.

New branches of The Mother Church established during 1959 included those in Utrecht, Netherlands; Kaiserslautern and Duisburg-Hamborn, Germany; Guadalajara, Mexico; Queensland, Australia; and Papaparaumu, New Zealand.

Carefully authenticated accounts of healing in Christian Science of asthma, glaucoma, diphtheria, stomach ulcer, rupture, broken bones, and other serious conditions were read at the annual meeting of The Mother Church held in Boston on June 8, 1959. A substantial increase in the sales of the Christian Science textbook, *Science and Health with Key to the Scriptures* by Mary Baker Eddy, discoverer and founder of Christian Science, was reported.

On June 8, 1959, Mrs. Kathryn Cook of Boston, Mass., was named president of The Mother Church for a one-year term. She succeeded Leonard T. Carney, a member of the board of trustees of The Christian Science Publishing Society. Also announced at the annual meeting was the election of Arthur P. Wuth of Denver, Colo., as first reader and Mrs. Josephine Carver of Brookline, Mass., as second reader.

In 1959 the denomination's daily newspaper, *The Christian Science Monitor,* published an unprecedented series of "summit interviews" based on around-the-world visits with the heads of governments. The series "How Christian Science Heals" completed its fourth year on television and its sixth year on radio.

WILL B. DAVIS,
Manager of Committees on Publication,
The First Church of Christ, Scientist, Boston.

CHRISTMAS ISLAND. The two islands with this name are:

(1) A British possession and the largest atoll in the Pacific Ocean (area, 234 square miles; pop., 258 in 1954), constituting with Fanning and Washington the Line Islands, a group in the Gilbert and Ellice Islands Colony (see WESTERN PACIFIC ISLANDS, BRITISH). An area of the Pacific centered about Christmas Island was the site for British nuclear weapons tests in 1957 and 1958. A copra plantation is worked by the government.

(2) An Australian dependency situated in the Indian Ocean, about 190 miles south of Java Head and 259 miles northeast of the Cocos (Keeling) Islands. This former dependency of Singapore (area, 260 square miles; mid-1958 est. pop., 3,000) was formally transferred to Australia as of Oct. 1, 1958. Large deposits of lime phosphates are worked by the Christmas Island Phosphate Company, Ltd., which employs most of the island's labor force (chiefly Chinese and Malayans).

CHROMITE. World production of chromite in 1958 was estimated at 4,050,000 short tons, compared with 5,125,000 tons (a revised figure) in 1957, according to the U.S. Bureau of Mines. The United States produced only 144,000 tons, or 4% of world output, in 1958. Its chromite ores and

concentrates were from 90 mines and mills in five states. Since the domestic output is small and of substandard quality, the United States depends upon imports. In 1958, imports for consumption totaled 1,263,000 short tons, compared with 2,283,000 tons (revised) in 1957. Exports were only 717 tons. Consumption was 1,221,000 tons, of which 778,000 tons was used in metallurgical work. The refractory industry used 312,000 tons, and the chemical industry consumed 131,000 tons.

In the first nine months of 1959, domestic output (shipments) of chrome ores totaled 83,321 short tons; imports were 1,149,987 tons; and consumption was 1,035,307 tons. The U.S. Bureau of Mines reported that all domestic chromite mines except one (in Montana) ceased production in the first half of 1958, because the government's purchase program for chromite was terminated. (See MINERAL PRODUCTION for output of major producing countries.)

CHRONOLOGY, 1959. A list of the important dates of 1959, and a Chronological Index of the more important events of the year may be found at the front of the volume.

CHURCH MEMBERSHIP, U.S. The *Yearbook of American Churches for 1960* reports that in 1958 there were 109,557,741 members of 251 religious bodies in the continental United States, including Alaska. This membership is an increase of 5,368,063—or slightly more than 5%—over 1957. Local churches (parishes and congregations) numbered 309,449 in 1958.

Statistics for 83 religious bodies with memberships of 50,000 or more (representing 98.8% of all members) are given in the following table.

U.S. CHURCH MEMBERSHIP, 1958[1]
(Churches of 50,000 or more members)

Religious body	Members
Protestant Bodies	
Adventists, Seventh-day	301,826
Apostolic Overcoming Holy Church of God	75,000[2]
Assemblies of God	505,552
Baptist Association, American	630,000
Baptist Association, North American	261,202[2]
Baptist Association of America, Conservative	275,000

Total church membership set a new record in 1958 and also represented a higher percentage (63%) of the population than in 1957. The population of the United States rose 1.7% in 1958, while church membership increased more than 5%. Roman Catholic membership showed a gain of over 10% during 1958 (the Military Ordinate, now with the status of a diocese, reported for the first time, with 2,000,000 persons); Protestants (reporting) gained 2.8%. Of the total of church members, 61,504,669 were Protestant; 39,509,508, Catholic; 5,500,000, Jewish; and 2,545,318, members of Eastern Orthodox churches.[1] (See also RELIGION.)

CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS. As of Jan. 1, 1959, church membership was 1,555,799, including 33,330 converts baptized in 1958. There were 2,513 wards and independent branches, 273 stakes, and 47 missions. New missions were organized in Germany, in Chile and Peru, and in Brazil. The church had approximately 5,750 full-time missionaries and more than 6,300 part-time missionaries throughout the world.

President Stephen L. Richards, first counselor in the First Presidency, passed away May 19, 1959. President J. Reuben Clark, Jr., formerly second counselor, was named first counselor, and Henry D. Moyle of the Council of the Twelve Apostles was

[1] Roman Catholics count all baptized persons, including infants; Jews count all those living in communities having congregations; the Eastern Orthodox churches count all persons in their nationality or cultural groups. Most Protestant bodies count only those who have attained full membership, although many Lutheran bodies and the Protestant Episcopal Church now report all baptized persons.

THE NEW YORK TIMES

Elephants and clowns of Ringling Brothers Circus, which began its 1959 season at New York's Madison Square Garden in March, enter Manhattan across an East River bridge.

named second counselor in the First Presidency. At the October Semi-Annual Conference (October 9–11), Elder Howard W. Hunter of Pasadena, Calif., was sustained as a member of the Council of the Twelve Apostles.

The Mormon Tabernacle Choir completed 30 years of continuous national broadcasting in July 1959. The program was voted America's favorite classical and religious program in the 12th annual listeners' poll conducted by *TV Radio Mirror Magazine* in April 1959. The Hill Cumorah Pageant, held at Palmyra, N.Y., on August 6–8, broke all attendance records; an estimated 135,000 persons witnessed this annual production.

The church's building program continued unabated with more than 750 chapels and schools under construction. The Church College of Hawaii at Laie, Oahu, was completed and dedicated in 1959.

The Brigham Young University in Provo, Utah, was host to an Indian Youth Council which brought to the campus representatives of 48 tribes for a three-day conference devoted to Indian problems.

The Genealogical Society of the Church greatly enlarged its collection of microfilm records in 1959, and now has in its library more than 300 million pages of records copied on microfilm. Many microfilm projects were under way in the United States, Europe, and Mexico, and the society acquired two very large collections of English records numbering thousands of volumes.

The activities of the Church Welfare Plan were given special emphasis in 1959, members throughout the church donating labor on farms and in factories and various industries.

JOSEPH ANDERSON,
Secretary to the First Presidency.

CIGARETTES AND OTHER TOBACCO PRODUCTS. See TOBACCO.

CIRCUSES AND RODEOS. **Circuses.**—During 1959 circuses were plagued by unusually hot and rainy weather and a polio scare, but they had a fair season nevertheless. The effect of the abandonment of outdoor showings by Ringling Bros.–Barnum & Bailey was counteracted by intensified publicity and enlargement and improvement of the shows, and interest in circuses has held up well in the face of many new competing attractions. The Circus World Museum, which opened July 1, 1959, at Baraboo, Wis., has played a part in making new circus enthusiasts, drawing more than 60,000 visitors in its first month.

Cristiani Bros., now a top-rated circus, had a successful year although attendance in Chicago, one of its principal stands, fell considerably below 1958. The Clyde Beatty–Cole Bros. Circus departed from its usual route, bypassing the Midwestern and Central states and doing an excellent business in the eastern United States and Canada. The Al G. Kelly–Miller Bros. Circus and the Mills Bros. Circus, both sizable tent shows, did quite well. Indoor dates of Ringling Bros.–Barnum & Bailey were spotty, but the season was considered satisfactory. There is little expectation that this circus will return to showing under canvas, but the organization is considering a European unit, to play auditoriums and arenas. Small circus units, of which there are some 30 or more on the road, had only a fair season, and a few of them closed in midseason.

Rodeos.—Tourists still keep the Pendleton, Oreg., Cheyenne, Wyo., and Calgary, Alberta, rodeos in the top brackets, these three cities having become identified with Wild West entertainment. But many rodeos are following the trend of the fairs and are booking top-ranking Western stars to supplement the contest features. In 1959 the "Days of '47" rodeo in Salt Lake City, Utah, featured Roy Rogers, Dale Evans, and their troupe and drew an attendance of 12,000 a day for eight days. Rex Allen and his troupe were responsible for attendance records at North Platte, Nebr.; Vernon, Texas; Nampa, Idaho; and Ogden, Utah. The "Pike's Peak or Bust" rodeo at Colorado Springs, Colo., with Dale Robertson featured, drew 9,000 a day for six days. The many small rodeos through the Southwest and West depended mainly on the Wild West contests and drew well when the weather was favorable.

NAT GREEN,
Chicago Representative, "Radio-Television Daily"; former Manager, Chicago Office, Ringling Bros.–Barnum & Bailey Combined Shows.

CITRUS FRUIT. See FRUITS.

CITY PLANNING. Problems of internal circulation, urban renewal, central business districts, and airport location and development were among the major concerns of city planners during 1959.

Internal Circulation.—The rapid development of suburbs beyond economical reach of public transit, the financial inability of railroads to provide good commuter service (see RAILROADS), and the expansion of the expressway systems all contributed to problems of circulation within cities and metropolitan areas. Major transportation planning studies were completed in several metropolitan areas, including Washington, D.C., where a system of expressways, major streets, and four rapid transit lines was recommended. By the end of the year a similar study was nearing completion in Chicago, one was under way in Pittsburgh, and another was begun in the Philadelphia-Camden metropolitan area. Unconventional methods of mass transportation were studied in several cities, including Detroit, where a monorail system was proposed and rejected.

In some cities the relative emphasis to be placed upon public transit, expressways, and surface streets became a controversial issue. In the Boston area a former commuter railroad line was converted to rapid transit in 1959, but other suburban lines were abandoned. In the New York, Boston, and Chicago regions extensive reductions in suburban rail service were made, and further reductions were in prospect. Expressways were being rapidly extended, and major links were opened during the year in the metropolitan areas of Chicago, San Francisco Bay, Seattle, Los Angeles, and other cities.

Urban Renewal.—In 1959, much progress was

made in urban renewal, in spite of the curtailment of federal funds the preceding year. In New York, many projects are under way, including the Lincoln Center program, an extensive area for cultural and educational institutions on the west side of Manhattan. In Chicago, the Prairie Shores and other projects are extending a comprehensive renewal area involving a substantial part of the South Side. Many renewal projects are essentially nonresidential, and the fact that the federal program is administered under a housing act is a handicap to many cities that desire aid in renewal of nonresidential areas.

Much encouragement was offered by the 1959 Congress, which authorized 37,000 new public housing units, $50 million in federal loans for housing for the elderly, $650 million in urban renewal grants to cities, and $10 million for grants to small cities for comprehensive planning. To be eligible for these last grants, a city must now have a maximum population of 50,000, as compared with 25,000 in previous years. (See also HOUSING.)

Central Business Districts.—Much attention has been given to the rehabilitation of central business districts in order to meet the competition of newer commercial centers in outlying sections of cities and in suburbs. Several cities are planning or constructing with public funds systems of peripheral parking on the fringes of their business districts. Major downtown streets are being closed to traffic in some cities in order to duplicate downtown the amenities of the outlying shopping plazas with center malls. In Kalamazoo, Mich., the main downtown shopping street was permanently replaced by a landscaped mall.

Although the central business districts of most cities face continued decline of retail activity, many downtown areas are experiencing a rapid expansion of office-building and hotel construction. In New York, Boston, Newark, Chicago, San Francisco, Oakland, and other large cities, modern office buildings are reinforcing the importance of central areas as business headquarters. Large hotels are planned or under construction in downtown New York, Chicago, Cleveland, Portland (Oreg.), Dallas, and other large cities.

Airports.—The advent of large-scale use of jet aircraft by commercial airlines in 1959 intensified problems of metropolitan airport location and development. Jets are noisy, and for that reason severe restrictions are placed on their use of some airports. One major airline is converting its jets to turbofan power, mainly to reduce noise levels. The comprehensive development of the New York International Airport continued during the year, and several new terminal buildings were opened. In Chicago, a shift of airlines to O'Hare International Airport was accelerated by the fact that jets cannot use the Chicago Midway Airport, which until 1959 was the world's busiest.

Other Planning Developments.—A comprehensive study of the New York metropolitan area (the first since the 1920's) was completed in 1959, and the first three of nine volumes on it were published late in the year. This study is expected to furnish a basis for metropolitan planning to solve several problems which were analyzed in detail. They include the changing functions of Manhattan, increases in the in-migrant population with related housing problems, and the changing role of the area as a port and transportation center, together with problems of re-use of areas where industrial activity is declining.

The opening of the St. Lawrence Seaway (q.v.) in April focused attention on port terminal and industrial development in cities on the Great Lakes, and on competitive adjustment in port cities of the Atlantic and Gulf coasts. In these cities much planning was devoted to terminals and waterfront land uses.

JOE CLARK—LIFE, © TIME, INC.

In Kalamazoo, Mich., a main business street has been converted into a 924-foot mall to allow shoppers to walk comfortably without interference from automobile congestion.

Prospects of greatly increased enrollments in colleges and universities stimulated planning of new campuses in a number of cities, including New York, Chicago, and Milwaukee. In some instances, elimination of blighted areas by urban renewal programs will provide the necessary land in the central parts of the cities.

The rapid expansion of suburbs has stimulated interest in preserving the remaining open spaces in and near cities for recreational use. Congress authorized a nationwide study of the problems of recreational land, and many local areas have initiated their own studies. In northern Indiana, near Chicago, the Dunes area has been selected by several steel companies as sites for large new plants, although it is one of the few remaining scenic shoreline areas of the Great Lakes accessible to large metropolitan populations.

City and regional planners are greatly concerned about the shortage of qualified persons entering the profession, and with the quality of training available to prepare them. In several states, bills have been introduced for the licensing or certification of professional planners, a step which some planners believe would prematurely narrow the range of professional qualifications. Meanwhile, the shortage of trained personnel continues to retard the development of planning in many communities.

CIVIL LIBERTIES. As had been true of the nation's record on civil liberties for the period since World War II, the year 1959 showed both progress and retrogression. There were significant developments in the field sometimes spoken of as that of individual rights versus national security, as well as in the area of race relations.

Once again powerful voices were raised in protest against recent U.S. Supreme Court decisions concerned with internal security matters. The most spectacular attack came from the American Bar Association's special Committee on Communist Tactics, Strategy, and Objectives, whose report was approved by the association's House of Delegates on February 24. The committee refrained from attacking the motives of the justices and defended the court as an institution, but nevertheless went on to urge Congress to pass legislation modifying the effects of certain Supreme Court decisions which had "weakened our internal security."

This report elicited from the American Civil Liberties Union a vigorous defense of the court and its role in safeguarding fundamental rights. It charged that the American Bar Association's proposal would upset the "precious balance" between individual freedom and national security.

On June 24, 1959, the U.S. House of Representatives adopted (by a vote of 225 to 192) the proposal of Congressman Howard W. Smith of Virginia for "correcting" recent Supreme Court rulings on subversion and criminal procedure. The Senate took no final action on the House measure.

Ironically, during its 1958–59 term, the Supreme Court handed down a number of decisions which, in the eyes of many observers, seemed to "soften" or limit the effect of some of its most severely criticized rulings. Thus in *Barenblatt* v. *United States,* decided on June 8, 1959, the court upheld the conviction (for contempt of Congress) of a college teacher who had refused to tell a subcommittee of the House Committee on Un-American Activities whether he was or had been a member of the Communist Party. It rejected his claim that the committee's purpose was the unconstitutional one of "exposure for exposure's sake" and that the inquiry interfered with freedom of speech and association. "An educational institution," wrote Justice Harlan for the majority, "is not a constitutional sanctuary from inquiry into matters that may otherwise be within the legislative domain merely for the reason that inquiry is made of someone within its walls."

Chief Justice Warren and Justices Black, Douglas, and Brennan dissented, as they also did from the decision in *Uphaus* v. *Wyman,* which was handed down the same day. In this case Justice Clark led the court in holding that New Hampshire was not precluded by the Smith Act of 1940 from enacting legislation constituting its attorney general as a one-man committee for the purpose of investigating the presence of subversive groups or persons in the state. Justice Clark emphasized that the 1956 decision in *Pennsylvania* v. *Nelson,* which had struck down Pennsylvania's Sedition Act on the ground that it had been "superseded" by the Federal Smith Act, was not to be construed to strip the states of "the right to protect themselves."

Just before adjourning, the court, speaking through Chief Justice Warren, announced a decision hailed as a victory for individual rights. In *Greene* v. *McElroy* it ruled that without explicit authorization from either Congress or the president, the Defense Department could not require concerns with defense contracts to dismiss employees as security risks if such employees were not afforded the opportunity to confront and cross-examine their accusers. Only Justice Clark dissented.

The struggle over discrimination and segregation continued unabated during 1959. In Little Rock, Ark., the school situation took a more encouraging turn, as the city's four public high schools reopened in August, after having been closed since the previous September. Two of the schools enrolled both white and Negro pupils. Another major development was the collapse in Virginia of the program of "massive resistance" to integration of the state's public schools. (For further details on these developments, see ARKANSAS; EDUCATION; VIRGINIA.)

A survey released in August by the American Jewish Congress revealed continuing progress by state legislatures toward erasing racial and religious discrimination. In 1959 at least 14 states passed measures dealing with discrimination. A total of 16 states now have enforceable fair-employment laws, and 24 have enforceable laws prohibiting discrimination in places of public accommodation. In 1959, Connecticut, Massachusetts, Colorado, and Oregon became the first states to enact laws against discrimination in the general housing market.

To the future historian, however, the most significant event of the year may well have been the appearance of the first report of the U.S. Commission on Civil Rights. The commission was created by the Civil Rights Act of 1957, but its work was not launched until the following May. Its 668-page report, presented to President Eisenhower on Sept. 9, 1959, is a detailed and forthright document—so forthright, indeed, that it precipitated a concerted attempt in the Senate to liquidate the commission. But in a "rider" attached to the foreign aid appropriations bill, passed on the last day of the first session of the 86th Congress, the life of the commission was extended for another two years.

The commission, which is a fact-finding body, studied three problems: voting, education, and housing. Its investigations encountered official resistance from the very start. In Alabama its inquiry at the beginning of the year into denials of the right to vote was frustrated by both election officials and the courts. In Louisiana a court injunction in July restrained the commission from conducting hearings on the denial of voting rights.

On the subject of interferences with the right to vote, the commission concluded: "It has become apparent that legislation presently on the books is inadequate to assure that all our qualified citizens shall enjoy the right to vote. There exists here a striking gap between our principles and our everyday practices."

Among the commission's specific proposals are the recommendations that Congress enact a law requiring the states to keep voting records for at least five years; that the president be authorized to submit to the commission complaints of the denial of voting rights; and that he be permitted to appoint temporary registrars to facilitate the registration of Negroes in areas in which they have been kept from registering.

With respect to one of the commission's significant findings in the field of education, the report stated: "The Commission's studies, and particularly its conference with school officials from districts in border States and a few in the South that have in some measure desegregated since 1954, demonstrate that when local school officials are permitted to act responsibly in adopting plans that fit local conditions the difficulties of desegregation can be minimized."

The commission's attitude toward what it calls the "housing crisis" may be gleaned from this observation: "The need is not for a pattern of integrated housing. It is for equal opportunity to secure decent housing."

The Commission on Civil Rights was not content to put on record its findings. It proceeded to present a program calling for improvements in all three areas it surveyed, and

to establish the interrelationship of these fields. Its report ends with an eloquent reminder: "Through its studies of three particular aspects of civil rights—voting, education, and housing—the Commission has come to see the organic nature of the problem as a whole. The problem is one of securing the full rights of citizenship to those Americans who are being denied in any degree that vital recognition of human dignity, the equal protection of the laws."

(See also CENSORSHIP; EDUCATION; LAW; NEGROES, AMERICAN; and the Index entry, *Civil Liberties.*)

SAMUEL J. KONEFSKY,
Visiting Professor of Political Science, The Johns Hopkins University.

CIVIL SERVICE, U.S. On June 30, 1959, there were 2,382,781 civilian employees of the federal government. They were located as follows: 183,435 outside and 2,199,346 within the United States, including about 234,000 in the Washington (D.C.) metropolitan area. The Department of Defense employed 45%, the Post Office Department 23%, the Veterans Administration 7%, and all other agencies 25%. About 86% of all employees and 91% of those in the United States were in the competitive Civil Service.

On Feb. 28, 1959, Harris Ellsworth retired as chairman of the Civil Service Commission, and he was succeeded on March 9 by Roger W. Jones.

Major emphasis in the Civil Service during 1959 was on improvement of the government's personnel system and recruitment of high-quality career employees at the entrance level. An important suggested improvement of the system was the proposal for group health insurance coverage for federal employees. The government and employees would both contribute to the cost of this protection. This proposal was incorporated into the Federal Employees Health Benefits Act which was signed into law by President Eisenhower on Sept. 28, 1959. The following day, the Civil Service Commission announced that a Bureau of Retirement and Insurance would be set up to administer the act, which will take effect in July 1960.

Agencies moved ahead to provide job-related training to their employees as authorized by the 1958 training law. In the fall of 1959, 16 federal agencies in the Washington area offered 85 courses on an interagency basis in such areas as general management, administrative operations, supply and transportation, personnel administration, communications and language, and safety. This training is for the benefit of the government and supplements basic education requirements, on-the-job training, and employee self-development.

The federal service entrance examination was geared to the academic year in 1958–59. The change brought record numbers of applicants, test-participants, and eligibles. By August nearly 4,000 persons had been hired under the examination during 1959. A new examination will be held for appointments in 1960.

Inspection of agency promotions made under the new federal merit promotion program, which went into full operation on Jan. 1, 1959, reveals that real progress has been made. Employees have greater opportunity to advance according to their abilities, and there is more assurance of making sound placements because more employees are considered for each vacancy.

During the 1959 fiscal year, the Civil Service Commission completed new classification standards for over 55 professional, technical, and business-type occupations which include about 330,000 federal positions. Classification standards, which are the basis for setting pay grades for most federal white-collar employees, are now substantially current.

Among new publications distributed during the year by the commission were *Biography of an Ideal: the Diamond Anniversary History of the Federal Civil Service,* and *Civil Service and the Citizen,* designed as a supplemental teaching aid for use in high school social studies classes.

ROGER W. JONES,
Chairman, U.S. Civil Service Commission.

CLAY. In 1958 the United States produced 43,750,000 short tons of clay of all kinds, compared with 45,622,000 tons in 1957, according to the U.S. Bureau of Mines. The 1958 total comprised 2,222,185 tons of kaolin, 396,949 tons of ball clay, 8,808,175 tons of fire clay and stoneware clay, 1,291,414 tons of bentonite, 357,883 tons of fuller's earth, and 30,673,513 tons of miscellaneous clay (including slip clay). There was a decrease of 4% in overall clay production in 1958 from that of 1957. Heavy clay products (building brick, structural tile, and sewer pipe) comprised 49% of the total clay output, as in 1957. Georgia kaolin production amounted to over 75% of domestic tonnage.

CLEVELAND. Biggest city in Ohio and the seventh most populous in the United States, Cleveland had an estimated population in 1959 of 926,808, as compared with the 1950 census figure of 914,808. Cuyahoga County, which has an area of 463 square miles (including Cleveland's 73.43 square miles), had an estimated 1959 population of 1,653,315, as compared with 1,389,532 in 1950.

Citizens of the Cleveland metropolitan area focused their attention in 1959 on the city's plans for its future. Civic debate during the year centered on two main issues: (1) Should public land in the heart of the city be leased to a private corporation as the site of a hotel for which the city has great need? (2) Should a metropolitan government be established within the county with exclusive powers in certain fields in order to handle governmental problems more efficiently?

Voters in the Nov. 3, 1959, election answered "No" to both questions. They also turned down city charter amendments to extend terms of the mayor and councilmen to four years and to permit the City Council to determine the salaries of members of the zoning and building boards.

Approved were city bond issues of $6 million for sewers and $3 million for recreation centers, and county issues totaling $3,500,000 for hospital improvements. Five other money issues were rejected.

A fourth term was won by Mayor Anthony J. Celebrezze (Democrat), and the Democratic majority in the City Council was strengthened.

Many of the city's financial problems were solved by the voters in the May primary election. They approved a 12.55-mill operating levy for the city of Cleveland, which will yield about $11,500,000 a year, and a 1.3-mill Cuyahoga County welfare levy. Some of the city's operating funds went to pay wage increases which had been granted municipal employees in January 1959. No pay increases were contemplated in the 1960 operating budget of $53,127,135, which was $1,583,461 higher than that for 1959. The city's net tax-supported debt (Jan. 1, 1959) was $118,142,065. The overall net tax rate of city, county, and schools was $36.30 per $1,000 of assessed valuation in 1959. The county budget for 1960 was $64,912,769, about 61% of which would go to welfare and relief. That total was $6,243,112 higher than that for 1959.

Enrollment in Cleveland's public and parochial school systems in September 1959 was 235,781.

Opening of the St. Lawrence Seaway (q.v.) late in April 1959 quickly multiplied foreign shipments going in and out of the port of Cleveland. By October more than 400 foreign ships had docked there and overseas trade cargo tonnage had passed the 150,000-ton mark, compared with 68,007 tons for all of the 1958 season when the 14-foot St. Lawrence canal system restricted shipping lines. This increase in harbor activity helped to offset the domestic fleet's drop in iron ore and limestone hauling activities, which were sharply reduced through most of the season because of the prolonged steel strike (see IRON AND STEEL).

Industrial and business activity in the Greater Cleveland area also felt the effects of the steel strike, but not to the extent that had been forecast. More than 20,000 workers in the area were idle because of the strike by the end of October. When steel workers returned to the mills in November, statisticians reported about 9% of the industrial workers in the area had been made idle directly or indirectly by the dispute. The Cleveland Chamber of Commerce employment index figure for October 1959 was 95.3, compared with the recession low of 85.7 in July 1958. Building permits issued from January through October 1959 had a total value of $250,924,000; for the same period of 1958, $216,085,000.

RUSSELL H. REEVES,
Assistant Managing Editor,
Cleveland "Plain Dealer."

CLIMATE. See METEOROLOGY AND CLIMATOLOGY.

CLOTHING INDUSTRY. Informal apparel, as a reflection of the era of casual living, retained in 1959 the supremacy it has held for more than a decade. The expected resurgence of demand for more dressy clothes, particularly in women's wear, has made itself evident only in irregular spurts. Items associated with casual and suburban ways of life have fared relatively well in terms of production. Blouses, skirts, and house dresses all showed increased production in 1958.

Dollar volume by the women's outerwear branches of the industry in the United States during the second half of 1958 was ahead of corresponding 1957 sales except in unit-priced dresses. During the first half of 1959, sales topped the first half of 1958 in every trade. However, the patterns of gain were not the same; skirts moved ahead by 11%, dozen-priced dresses by 9%, unit-priced dresses and coats and suits by 6%, and blouses by 4½%.

Trade reports indicate that market volume in knit goods, sportswear, children's wear, lingerie, corsets, and brassieres showed similar growth, with recovery setting in during the second half of 1958 and advancing in 1959.

In the first half of 1959, 7% more coats and 30% more suits were produced than in the first half of 1958. The first six months' output in 1959 was ahead of the like period in 1958 by 16% in dresses wholesaled by the dozen; by 11% in dresses wholesaled by the piece; and by 8% and 7%, respectively, in blouses and skirts.

Preliminary net value of shipments of women's, misses', and juniors' outerwear, excluding knit outerwear, amounted to $3,105 million in 1958, compared with $3,232 million in 1957, an average loss of about 4%. Net value was $1,518 million for the first six months of 1959, compared with $1,423 million for the same period of 1958, a rise of 6.6%.

Production in 1958 and the first half of 1959 was as follows:

Category	Net value: Year 1958 (millions of dollars)	Net value: 1st half 1959 (millions of dollars)	Production: Year 1958 (millions of units)	Production: 1st half 1959 (millions of units)
Unit-price dresses	$1,228	$672	140.1	84.6
Dozen-price dresses	391	217	100.6	59.0
Coats and suits	802	321	...[1]	...[2]
Blouses	361	163	176.9	96.0
Skirts	323	145	84.2	57.3

[1] Untrimmed coats, 24.2; suits, 9.6. [2] Untrimmed coats, 10.9; suits, 6.0.

Production of men's apparel in 1958 (in thousands of units, with 1957 figures in parentheses) was: suits, 18,183 (19,943); overcoats and topcoats, 4,504 (5,158); and separate dress and sport trousers, 71,382 (71,666). Output for the first six months of 1959 (in thousands of units, with figures for the like period of 1958 in parentheses) was: suits, 10,523 (9,137); overcoats and topcoats, 2,450 (2,044); and separate dress and sport trousers, 44,834 (36,348).

Total value of shipments of girls' and children's apparel, exclusive of knit outerwear, declined to $665 million in 1958, compared with $682 million in 1957. Dresses and blouses were up slightly to $279 million from $278 million; coats, suits, and snowsuits were down to $161 million from $173 million; and volume of other juvenile apparel was reduced to $225 million from $232 million.

New York City ranks first among the principal United States markets in all apparel categories. An analysis by the National Credit Office shows the following percentage breakdown for manufacturers' sales of four leading merchandise types in 1958 in the six largest production centers:

City	Women's and misses' unit-price dresses	Women's and misses' coats and suits[1]	Girls' and children's wear	Men's tailored clothing[2]
New York	71.9	71.1	69.1	35.2
Los Angeles	5.6	6.4	2.9	...
Boston	4.1	1.9	2.2	...
Chicago	2.9	4.1	2.3	9.4
St. Louis	2.6	...	...	...
Philadelphia	2.6	...	7.5	11.4

[1] Kansas City, with 3.9% of women's coat and suit sales, ranks fourth; Baltimore, with 3.0%, ranks fifth. [2] Baltimore, with 8.8% of men's tailored clothing sales, ranks fourth; Cleveland, with 5.3%, fifth; and Rochester, with 4.7%, sixth.

The apparel industry ranks 13th in value of sales; its estimated volume was $10 billion in 1958, compared with $10.3 billion in 1957. Considered as one industry, textiles and apparel rank 7th, with $12.5 billion in 1958, compared with $13.0 billion in 1957.

In 1959 the Bureau of Labor Statistics issued a report of changing American buying habits in which it is noted that the average share of the worker's dollar spent for clothing has declined since 1900 in the face of mounting real income. According to this study, 11½% of family expenditures went for clothing in 1950, compared with 13% just after the turn of the century.

SAMUEL FEINBERG,
Columnist, "Women's Wear Daily."

COAL. In 1958, world production of coal (including bituminous, lignite, and anthracite) attained a new record of 2,685,135,000 short tons, compared with 2,573,521,000 tons in 1957, according to the U.S. Bureau of Mines. During 1958 the USSR displaced the United States as the world's leading coal producer, a ranking held continuously by the United States since 1899. However, in terms of energy from coal, the USSR did not surpass the United States because much of the Soviet output is lignite, which has lower heating value than American bituminous or anthracite coal.

Also, the USSR has a relative scarcity of good coking coal. (See MINERAL PRODUCTION for output of major countries.)

United States.—Domestic production of anthracite and bituminous coal in 1952–58 in thousands of short tons is shown in Table 1.

Table 1—U.S. PRODUCTION OF COAL
(In thousands of tons)

Year	Anthracite	Bituminous and lignite	Total	Change (per cent)
1952	40,583	466,840	507,423	−12.0
1953	30,949	457,290	488,239	−3.8
1954	29,083	392,000	421,083	−13.8
1955	26,205	464,634	490,839	+16.6
1956	28,900	500,875	529,775	+10.8
1957	25,338	492,704	518,042	−2.2
1958	21,171	410,446	433,617	−16.3

(Source: U.S. Bureau of Mines.)

The United States produced 22% of the world's output of bituminous coal, less than 1% of the lignite, and 13% of the anthracite in 1958. Bituminous and anthracite production declined, as did also output of lignite. Anthracite exports dropped from 4,331,785 short tons in 1957, to 2,279,859 tons in 1958. The loss in bituminous output was due to decreased consumption in the United States because of a general decline in business and to reduced exports. In 1958 consumption decreased 11% from 1957, the decrease occurring in all classes of consumers. Exports of bituminous coal decreased 34% from 1957, and totaled roughly 50,000,000 short tons. Exports were chiefly to Canada (12,235,447), West Germany (9,708,332), Italy (6,989,027), Netherlands (5,515,399), South Korea (3,299,133), and France (3,000,913). Most of the coal in the United States was produced by 12 states, but 34 in all contributed to the 1958 total. Table 2 shows production by chief coal-producing states, from 1955 to 1958.

Table 2—U.S. PRODUCTION OF COAL, BY STATES
(In millions of tons)

State	1955	1956	1957[1]	1958[1]
Alabama	13.1	12.7	13.3	11.2
Colorado	3.6	3.5	3.6	3.0
Illinois	45.9	48.1	47.0	43.9
Indiana	16.1	17.1	15.8	15.0
Kentucky	69.0	74.6	74.7	66.3
Ohio	37.9	38.9	36.9	32.0
Pennsylvania				
Anthracite	26.2	28.9	25.3	21.2
Bituminous	85.7	90.3	85.4	67.8
Tennessee	7.1	8.8	8.0	6.8
Utah	6.3	6.5	6.9	5.3
Virginia	23.5	28.1	29.5	26.8
West Virginia	139.2	155.9	156.8	119.5
Wyoming	2.9	2.6	2.1	1.6
Other	14.3	13.8	12.7	11.2
Total	490.8	529.8	518.0	431.6

[1] Preliminary. (Source: U.S. Bureau of Mines.)

Canada.—Bituminous production in 1958 decreased from 10,940,000 short tons in 1957 to 9,434,000 tons, and lignite increased from 2,249,000 tons in 1957 to 2,253,000 tons in 1958.

Germany.—In 1958, West Germany's bituminous and anthracite coal output declined to 147,183,000 short tons from 148,068,000 tons in 1957. East Germany's production increased to 3,200,000 short tons in 1958 from 3,035,000 tons in 1957. Lignite production in West Germany declined in 1958 to 103,052,000 tons from 106,716,000 in 1957. East Germany's lignite output increased to 236,961,000 tons in 1958 from 234,346,000 tons in 1957.

United Kingdom.—In 1958 output of bituminous and anthracite coal declined to 241,721,000 short tons from 250,464,000 tons in 1957.

USSR.—Output of bituminous and anthracite coal rose from 360,455,000 short tons in 1957 to 385,809,000 tons in 1958, and lignite production rose from 149,914,000 tons to 160,937,000 in 1958. The USSR depends on coal for 70% of its requirements for energy.

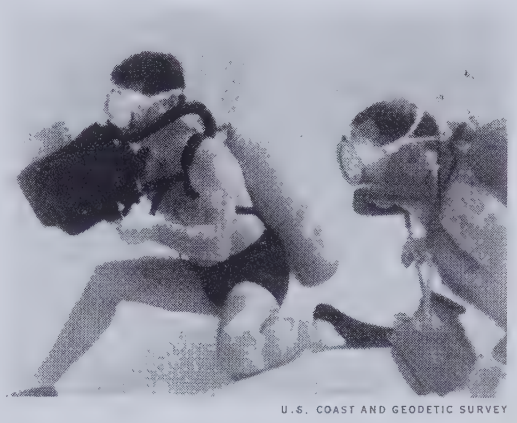
F. E. HARRIS,
Former Publications Editor, "Mineral Trade Notes," U.S. Bureau of Mines.



U.S. COAST AND GEODETIC SURVEY

Using special cameras, Coast and Geodetic Survey scientists measure underwater currents and movement of sand ridges.

COAST AND GEODETIC SURVEY, U.S. Work programs of this bureau of the U.S. Department of Commerce were modernized and expanded during 1959 to accelerate oceanographic, geodetic, and geophysical functions.

Oceanography.—Expanded oceanographic activities in 1959 included intensive bathymetric and other hydrographic investigations, using new procedures and techniques. Unique applications were made in measuring underwater currents and the movements of underwater sand ridges by divers equipped to photograph these movements. This technique was successfully employed in studying the descent and bottom impact of dummy containers proposed for disposal of atomic waste. Intensive surveys were made in New York Harbor of currents, water temperatures, and salinity of sea water. Radio current buoys employed in this operation were refined through the use of a new type of radio transmission which provides improved reception and a better tape record.

Tides and Currents.—Over 100 primary tide stations are operated in the United States and on certain Pacific islands to provide basic data for surveying and coastal engineering activities, and for the publication of standard volumes of tide and current tables. In connection with a low-water-line mapping project, a special tidal survey was begun during 1959 in the Mississippi River delta. Other scientific studies included investigations in southeastern Alaska on the apparent land emergence in the Icy Strait–Lynn Canal area. Through use of a new pressure-type tide gage, instant tidal information is being recorded locally or transmitted by wire or radio for remote recording.

Hydrography.—New hydrographic surveys were accomplished along the coast of Maine, on Georges Bank and Nantucket Shoals, along the north coast of Nantucket Island, in the Potomac River, and in several rivers and harbors in Florida. West coast surveys were conducted in the Strait of Georgia southward from the Canadian border. Surveys were continued in Clarence Strait, and a tidal survey was begun in southeastern Alaska. Surveys were accomplished in Prince William Sound, along the north shore of the Alaska Peninsula, and near Adak Island in the Aleutians. Offshore surveys were accomplished in the vicinity of Wake and Eniwetok islands.

Geodesy.—Approximately 3,300 new geographic positions and 14,500 elevations of bench marks were determined during 1959, bringing the national networks for the United States to about 156,000 and 373,000, respectively. The Telluriometer was employed effectively in extending trav-

erse surveys along interstate highway routes in 13 states. Gravity surveys were extended over 20,000 square miles in the north-central section of the country, and a gravity base line was established along the Pacific coast. The transcontinental geoid profile along the 35th parallel neared completion at the end of the year. Astronomic observations were made and compared with geodetic positions at 40 stations between Texas and California.

Photogrammetry.—Special air photographic studies were made in 1959, using panchromatic, infrared, and color photography for detailed mapping of the low-water line of the Louisiana coast. During the year the electronic computer adjustment of stereoscopic instrument bridges to horizontal ground control was improved, and methods of adjusting to vertical control were developed. Analytical photogrammetric bridging was adopted for use with special stereoscopic identification or marking instruments. Color photography was used effectively for the location of aids to navigation, for mapping of shoreline features, and for reconnaissance mapping of underwater features prior to inshore hydrography in areas of irregular bottom.

Geophysics.—World isogonic charts were completed for release by the U.S. Navy early in 1960 to show magnetic declination over the entire globe. The magnetic observatory at Guam was added to the permanent network of observatories operated by the Survey. Twenty-two seismological stations are operated in the United States and possessions, two in Antarctica, and one in Thule, Greenland, in connection with the worldwide program for locating earthquakes. Scientific information giving location, focal depth, and intensity was disseminated by the Survey for 1,230 earthquakes located during the year.

Charts.—Nautical and aeronautical chart production for 1959 totaled approximately 38 million charts of all types. The Survey introduced an entirely new series of small-craft nautical charts with the publication of the first of a series covering the Potomac River. Ten charts of the sectional areonautical series were recompiled during the year, making a total of 27 charts now being issued in the new format. Radio facility charts are now issued every four weeks to reflect installation of new radio navigational aids and frequent airspace amendments. An experimental radio facility chart portraying both the very high and low/medium frequency area systems was published and distributed for user comment and evaluation. New aircraft position chart 3096, covering an area from the west coast to Hawaii, was published. (See also CARTOGRAPHY.)

H. ARNOLD KARO,
Rear Admiral, USC&GS;
Director, Coast and Geodetic Survey.

COAST GUARD, U.S. In 1959 the U.S. Coast Guard strove toward its traditional peacetime objective of maintaining safety and order on the high seas and navigable waters of the United States. During the year a program was started to replace the remaining 83-foot wooden patrol boats with newly designed 82-foot steel boats. Funds available to the service rose from $275,493,840 in 1958 to $289,047,944 in 1959. Military personnel totaled 30,448 in 1959, compared with 30,128 in 1958; authorized civilian employees in 1959 totaled 4,758.

The following statistics show the volume of law-enforcement activity undertaken by the Coast Guard during 1959: vessels boarded and papers examined, 181,415; reports of violations of the Motorboat Act, 13,911; reports of violations of port security regulations, 621; permits to load or discharge explosives, 1,024; total tons of explosives covered by permits, 136,781; supervised loadings of explosives, 1,096; waterfront workers screened for security, 20,229; mariners' documents issued bearing evidence of security clearance, 14,719.

Assistance rendered during the year was as follows: assistance calls responded to, 28,342; value of property involved (including cargo), $1,482,991,900; vessels refloated, 1,692; vessels towed, 10,076; miles disabled vessels towed, 97,794; persons rescued from peril, 2,552.

Marine casualties reported and investigated during the year totaled 4,325. In 776 of the casualties reported, 1,136 lives were lost.

The Coast Guard completed 6,259 inspections of merchant vessels with a gross tonnage of 13,389,945; made drydock examinations of 5,673 vessels with a total tonnage of 14,558,081 tons; carried out 23,879 miscellaneous inspections; numbered 521,361 undocumented vessels; and reviewed plans for 30,500 merchant vessels.

As of June 30, 1959, there were 39,932 aids to navigation maintained in the United States, its territories and possessions, and the Trust Territory of the Pacific Islands, and at overseas military bases. These aids included 60 loran (long-range navigation) stations, 348 manned light stations, and 32 lightships.

Four ocean stations were maintained in the North Atlantic and two in the Pacific throughout the year. These vessels provided search and rescue, communications, and air navigation facilities and meteorological services along heavily traveled ocean routes.

Ice conditions in 1959 were of greater than average severity, requiring aerial reconnaissance and oceanographic work and two vessels for surface patrol.

The Coast Guard's larger ships consisted of 184 cutters and buoy tenders of various types. Fixed and rotary-wing aircraft in operation totaled 128.

Coast Guard Reserve strength was 3,874 officers and 29,173 enlisted personnel. The Coast Guard Auxiliary, a nonmilitary organization of volunteers, was active in more than 600 communities in the promotion of safety and efficiency in the operation of small boats. Its 18,407 members furnished 73,902 instruction courses, examined 84,976 motorboats, patrolled 659 regattas, and responded to 2,328 calls for assistance.

A. C. RICHMOND,
Vice Admiral, USCG, Commandant.

COBALT. World production of cobalt declined from 15,900,000 pounds in 1957 to 14,600,000 in 1958. (See MINERAL PRODUCTION for output of major producing countries.) The United States is the largest market for cobalt, according to the U.S. Bureau of Mines. For the first time the United States in 1958 was able to supply over 50% of its cobalt requirements. Production of recoverable cobalt in 1958 was 4,023,000 pounds, compared with 3,303,000 pounds in 1957. For metallic purposes 5,643,000 pounds were used in 1958, compared with 7,279,000 pounds in 1957; nonmetallic uses claimed 869,000 pounds, and salts and driers required 1,030,000 pounds in 1958.

Consumption decreased from 9,157,000 pounds in 1957 to 7,542,000 pounds in 1958. Imports decreased from 977,000 pounds (estimated cobalt content) to 874,000 pounds in 1958. Of the total imports, Belgian Congo, the chief source, supplied 65% and Belgium, 16%. Imports of metal declined from 16,173,000 pounds in 1957 to 15,719,000 pounds in 1958; there were no white alloy and oxide imports. In the first nine months of 1959, domestic mine production was 2,148,651

pounds, and imports totaled 12,816,000 pounds (estimated content).

COCOA. The U.S. Department of Agriculture estimated in October 1959 that world production of cocoa beans for the 1959–60 season would be 2,075.3 million pounds, an increase of more than 5% over the 1958–59 season. The accompanying table shows production by continent and principal producing countries.

WORLD COCOA BEAN PRODUCTION
(In thousands of pounds)

Continent or country	Average 1950–55	1957–58	1958–59	1959–60
North America	157,514	175,600	171,500	187,100
Dominican Republic	73,179	78,000	67,900	77,200
South America	403,746	518,450	518,181	563,200
Brazil	274,703	380,000	383,000	420,000
Ecuador	59,245	68,000	64,000	65,000
Africa	1,090,038	1,008,900	1,245,740	1,289,100
French Cameroons	123,190	147,700	134,040	145,500
French West Africa[1]	128,055	99,200	115,000	140,000
Ghana	524,897	474,300	575,000	590,000
Nigeria[2]	234,821	180,000	314,000	300,000
Asia and Oceania	15,838	32,500	34,300	35,900
World total	1,667,136	1,735,450	1,969,721	2,075,300

[1] Mostly Ivory Coast. [2] Includes British Cameroons.

Ghana and Brazil are the world's two largest producers of cocoa beans. They and the five other countries listed in the accompanying table account for almost 84% of the world's total production.

COFFEE. Total world production of green coffee for the marketing year 1959–60 was estimated by the Foreign Agricultural Service of the U.S. Department of Agriculture at 68,658,000 bags (of 132.3 pounds each). This production would represent an increase of about 14% over the previous record of 60,039,000 bags in 1958–59, and of nearly two thirds over the 1950–55 average output of 41,015,000 bags.

Exportable production for the 1959–60 marketing season was estimated at 58,636,000 bags, or more than 7 million bags over 1958–59 and 78% above the 1950–55 average of 32,589,000 bags.

WORLD PRODUCTION OF GREEN COFFEE
(1,000 bags)

Country	Annual Average, 1950–55	1958–59	1959–60
Brazil	18,964	30,000	36,000
Colombia	6,330	7,700	8,000
French West Africa[1]	1,342	2,350	2,500
Uganda	754	1,440	1,540
Angola	990	1,455	1,525
Belgian Congo and Ruanda Urundi	613	1,285	1,435
Mexico	1,373	1,600	2,150
El Salvador	1,216	1,500	1,475
Guatemala	1,129	1,400	1,500
Indonesia	985	1,165	1,200
World	41,015	60,039	68,655

[1] In 1959, consisting of the new republics of Dahomey, Ivory Coast, Mauritania, Niger, Senegal, Soudan, and Upper Volta.

The biggest rise in production was in Brazil, where a crop of 36 million bags was forecast, including a record 31 million for export. Colombia, the world's second largest producer of coffee, also anticipated a record crop. (See also INTER-AMERICAN AFFAIRS; ORGANIZATION OF AMERICAN STATES.)

Africa, ranking second in coffee production only to South America, expected a 1959–60 crop of 10,753,000 bags, of which 10,216,000 would be exportable. The output would constitute a record for Africa and an increase of about 5% above 1958–59.

The United States continues to rank as the world's largest coffee consumer. Per capita consumption of coffee by United States civilians declined from 19.8 pounds in 1946 to 14.7 pounds in 1954, but an upturn begun in 1955 continued through 1959. Per capita consumption was estimated by the Agricultural Marketing Service of the U.S. Department of Agriculture at 16.3 pounds in 1959, compared with 15.9 in 1958.

C. J. ENZLER,
Information Specialist, Office of Information, U.S. Department of Agriculture.

COINAGE. See MINT ESTABLISHMENT, U.S.

COKE. World production of coke in 1958 totaled 280.2 million short tons, of which the United States produced 19%, compared with 293.8 short tons in 1957, of which the United States produced 26%. (See MINERAL PRODUCTION for output of major countries.)

In 1958, production of coke in the United States decreased to 53,604,000 short tons, from 75,951,000 tons in 1957. The 1958 output comprised 53,005,730 tons of oven coke and 598,372 tons of beehive coke, compared with 73,860,692 tons of oven coke and 2,090,029 tons of beehive coke in 1957. In addition, 3,714,706 tons of coke breeze was produced in 1958, compared with 4,913,123 tons in 1957.

As demand for all grades of coke declined in 1958, producer stocks reached the highest total since 1932. Of the total output in 1958, shipments to blast furnaces constituted 90% of all coke deliveries, 4% went to iron foundries, 1% to producer-gas and water-gas plants, 4% to other industrial plants, and 1% to the residential heating trade. Potential maximum annual oven-coke capacity reached an all-time high of nearly 82.5 million tons in 1958. In the first nine months of 1959, coke output was 41,704,109 tons, compared with 37,709,300 tons in the same period of 1958.

COLD, Common. See RESPIRATORY DISEASES.

COLLEGES AND UNIVERSITIES. A selected list of the major colleges and universities in the United States, Guam, Puerto Rico, and Canada appears on the following pages. Statistics, unless otherwise indicated, are for the full 1958–59 academic year. All information concerning these institutions has been supplied by the head or registrar of each. (See also EDUCATION; and for a more complete list of institutions of higher education in the United States, consult the *Education Directory*, Part 3, "Higher Education," published annually by the Office of Education, Department of Health, Education, and Welfare, Washington, D.C.)

COLOMBIA. Astride the northwest shoulder of the South American continent (with 1,000 miles of Caribbean and 813 miles of Pacific coastline), the Republic of Colombia has a population of 13,522,000 (1958 est.). Its 439,829 square-mile area is larger than Texas and California combined. Bogotá, the capital, situated on a cool, central plateau (elevation over 8,500 feet) is a modern metropolis of 944,290 with suburbs totaling another 120,000 (1958 est.). Other principal cities (1954 est.) are: Medellín, 431,380; Cali, 365,800; and Barranquilla, 324,700.

Government.—A formal truce between the traditional party groupings (Liberals and Conservatives) provides for alternation of the presidency between the two and an equal division of administrative and congressional posts. This "National Front," which is to operate until 1974, must secure a two-thirds majority in order for its legislation to pass the Congress. President Alberto Lleras Camargo (Lib-

[1] Full time faculty only. [2] Most instructors are part-time. [3] Locally sponsored and operated as part of the program of the State University of New York. [4] Campuses are located at Berkeley, Davis, La Jolla, Los Angeles, Riverside, San Francisco, and Santa Barbara. [5] The 6 campuses, all in Chicago, are: Amundsen, Crane, Fenger, Southeast, Wilson, and Wright. [6] Other campuses at Teaneck and Madison, N.J. [7] Part of the University of Hartford. [8] The Colleges of the Seneca is the corporate name of Hobart (for men) and William Smith (for women) colleges, coordinated with the faculty and enrollment shown here for both. [9] The faculty of Harvard University is also that of Radcliffe College. [10] Branches are located at Galveston, Houston, El Paso, and Dallas. [11] All instructors are part-time. [12] Includes Milwaukee and 8 other campuses.

(COLOMBIA—*Continued from page 159*)
eral) was inaugurated Aug. 7, 1958, for a 4-year term under this system. In spite of the majority position of the Liberal Party, half of the 148 seats in the Chamber of Deputies (2-year term) and of the 80 in the Senate (4-year term) are held by various factions of the Conservative Party. For the first time, the 1958 election allowed women to vote and to run for office, resulting in the election of 1 female senator and 8 deputies. The Supreme Court has 16 members, divided into 3 chambers (general, civil, and criminal); it has the express power of "judicial review." A career Civil Service program was initiated in 1959.

Religion and Education.—A concordat with the Vatican grants a privileged position to the Roman Catholic Church. Crisanto Cardinal Luque, Colombia's first cardinal, died on May 7, 1959; he had at first supported the dictatorship of Lt. Gen. Gustavo Rojas Pinilla but was instrumental in the general's ouster in 1957. The church's Faith and Morals Commission in 1959 adopted a program to promote observance of the constitutional guarantee of religious freedom (other forms must not be "contrary to Christian morals or to the law"), but stonings and other acts of intolerance by laymen and, occasionally, by priests continued in rural areas where police refuse to take action in defense of Protestants.

In 1956, kindergartens had 45,234 in attendance; primary schools (free but not compulsory) and secondary schools had 1,418,552; there were 28 separate institutions of higher learning (13,284 students) besides many technical and special schools. Literacy extends to some 63% of a population which now is increasing more rapidly than are facilities for schooling.

Finance.—Gold and foreign exchange reserves recovered to $210 million by August 1959 (from a low of $109 million reached in mid-1958), in addition to which all but $116.5 million of the country's commercial arrears of $498 million (left by the Rojas Pinilla regime) had been paid off. Nonetheless, about one quarter (some $125 million) of Colombia's 1959 foreign exchange earnings had to go for foreign debt service. The money supply (962 million pesos in 1950) had risen to 3,263 million pesos by the end of 1958, and to 3,503 million by June 1959. The peso regained strength, exchanging freely at 7.84 to the U.S. dollar in August 1959 (December 1958, 8.23); the principal official rate, established in May 1959, was 6.40 pesos to the dollar. The cost-of-living index (1953 = 100) stood at 162 by July 1959 (end of 1958, 155).

The 1959 budget (resulting in a deficit of over 60 million pesos) totaled 1.5 billion pesos, 8% more than the previous year's. Public works received nearly 25% (a major increase over 1958's 19%); armed forces and police, 20%; Ministry of Education, 10%; public debt, 15%. The proposed 1960 budget programed 1.66 billion pesos with a substantial increase for maintenance of public order.

Transportation and Communications.—Rail routes, mostly 3-foot gauge, cover a total of 1,893 miles; freight traffic increased but slightly in 1958, to 705.6 million ton-kilometers. Colombia's international ocean traffic showed 4.7 million metric tons of goods loaded in 1958 (up slightly from 1957, but down from 4.85 million in 1956). Goods unloaded in 1958 totaled 1.02 million tons (1957, 1.35 million; 1956, 1.61 million). The Grancolombiana fleet operates (jointly with Ecuador) 27 ships with a total capacity of 130,000 tons. The airlines, principally government-controlled AVIANCA, carried 631.8 million passenger-km. and 51.7 million ton-km. of cargo in 1958. There are 16,577 miles of vehicular roads in operation, including the Colombian portion of the Simón Bolívar Highway from Guayaquil, Ecuador, to Caracas, Venezuela.

Agriculture.—Colombia is progressing agriculturally in spite of severe mountain barriers and limited tillable land area. Agricultural products provide 40% of the national income; industry is being expanded, but not at the expense of agriculture. Coffee is the basis of the Colombian economy. The 1958–59 crop, although affected by drought, amounted to 7.3 million bags (of 132 pounds each), 6.7 million of which were available for export (1957–58 crop, 7.0 million bags). The 1959–60 output is estimated at 7.8 million bags. The removal of marginal plantations from coffee production and the cultivation of other crops are being encouraged by means of high price supports and special credits to farmers (90 million pesos were released by the Central Bank in 1959).

The farm outlook is generally bright. Colombia now produces nearly 95% of her food needs; foodstuffs still amount to 15% of the total import bill. Since 1951, output of domestic cooking oils has increased 175%; in 10 years the rice harvest has more than doubled, allowing exportation to Canada and Venezuela (1959 crop estimate, 400,000 tons, worth $40 million). In 1959 the barley harvest (estimated at 105,000 tons) was expected to surpass that of 1958 by 40%; wheat production was running 28% above 1958. Production of sugar for 1959 totaled 280,000 metric tons, 11% above the 1958 figure; the cotton crop (an estimated 135,000 bales of 500 pounds each) was expected to exceed the 1958 yield by 40% but remained some 40,000 bales short of the rising domestic requirements. Bananas yielded an estimated 30 million stems (28 million in 1958).

Industry.—Industrial activity, slowed by the crisis period of readjustment after the fall of the dictatorship, showed modest gains during the final months of 1958 and in 1959. The new petrochemical industry is an example of the basic optimism of Colombia's long-run economic position (under construction or planned are polyvinyl chloride, synthetic resins, plastics, and lampblack plants). Petroleum production in the first half of 1959 was 3.6 million metric tons, running more than 10% ahead of 1958; production in 1958 totaled 6.5 million tons. In 1959 Cities Service struck oil in the El Carare area, and Shell Oil, in western Antioquía. Gold production of 371,714 troy ounces brought $13 million in 1958 (325,113 troy ounces worth $11.4 million were produced in 1957). Cement produced in 1958 totaled 1.2 million tons, slightly less than the 1957 figure. Electrical energy output came to 1.5 billion kilowatt-hours for 1958 (1957, 1.4 billion). Paz del Río, Colombia's iron and steel center employing 7,000, saved the country $37 million in imports in 1958; the country's 32 cotton mills produced more than 1 million yards of cloth daily in 1958.

Foreign Trade.—Again the restriction and close policing of imports brought Colombia a favorable balance of payments in 1958. Exports totaled $460.7 million (down from $511.1 million in 1957), and imports were valued at about $400 million. Although volume went up 13%, coffee receipts brought $354.8 million ($390.1 in 1957) because the New York price fell during the year from approximately 57 cents to 46 cents per pound for Manizales, Colombia's mild type (August 1959 price, 45.1 cents; low in June 1959, 44.3 cents; 1954 price, 80 cents). Petroleum receipts were $64.4 million ($72.4 in 1957).

In 1959, import authorizations threatened to get out of hand; so on July 10 the administration increased the import deposit from 100% to 130% and extended from 60 to 90 days the time the deposit must remain after clearance through customs of the imported merchandise. In May a new tariff was put into effect. Essential goods, such as motor vehicles and parts and certain hydrocarbon fuels, have lower duties; some 700 new items became dutiable; the duty on items available from national production (including many agricultural products) was increased; and the duty was removed from machinery, rubber, and fertilizers. Since 1957 all exports have been subject to a 2% export tax except coffee, bananas, raw hides, and precious metals, which pay 15%.

In exchange for coffee, Colombia will take ships, chemicals, machinery, tractors, and other industrial products from Israel, Rumania, the USSR, England, Spain, Sweden, and Denmark, with which barter agreements were concluded in 1959 in a drive to create new markets. Coffee exports during the first half of 1959 (2.9 million bags) brought $164 million, 18% in excess of the first half of 1958, but volume was up 29%.

Principal Events, 1959.—A special session of Congress, convened in January, conducted the "delayed impeachment" of ex-president Rojas Pinilla. The Senate sat as jury to hear charges that Rojas had violated the constitution, abused his authority, and acquired great wealth improperly. Rojas and his attorney protested the illegality of the proceedings but went on to implicate others in wrongdoing, particularly the Conservative Party leader and ex-president, Laureano Gómez. On March 18 the trial was concluded; Rojas was found guilty on two charges by votes of 62 to 4 and 65 to 1, and on April 2 he was deprived of all honors, titles, political rights, and the pension given former presidents. He was then turned over to the Supreme Court for actual criminal prosecution.

On January 12 the state of siege was lifted except for Caldas, Cauca, Huila, Tolima and Valle del Cauca departments where considerable banditry and terrorism persisted. By midyear, incidents were again occurring at an alarming rate. During the second half of 1959, drastic measures were

instituted to curb the violence that had plagued the country since the bitter guerrilla warfare began in the rural regions in 1949; 359 convictions were secured for the month of July in Valle del Cauca Department alone. Nevertheless, 50 lives were lost during violence in August. Urban dwellers were roused from complacency by raids in cities and by a "Crusade for Peace" speech by the new archbishop, Msgr. Luis Concha Córdoba. A new island prison, Gorgona (surrounded by shark-infested waters), was made ready to receive hundreds of prisoners from the general crackdown.

The high cost of living, aggravated by government authorizations for increases in the prices of gasoline, meat, bus fares, and utilities, contributed to a general discontent, especially on the part of labor groups. In the face of riots and agitation the government returned bus fares to 15 centavos (2 cents) and took other steps regarded by the business community as dangerous appeasement.

A flourishing contraband trade has grown up with Colombia's neighbors. With Ecuador, wheat and cacao are exchanged for manufactured goods; oil-rich Venezuelans pay as much as $150 per head (twice the domestic price) for Colombian cattle. Border towns do a booming business with Venezuelan "tourists" looking for coffee, clothing, and manufactured items. Contraband coffee involves some 300,000 bags annually.

On September 24, Colombia signed the International Coffee Agreement at Washington, D.C., accepting a quota of 5.9 million bags, 10% under the export figure for the best year (1953) in the last ten.

ROBERT D. HAYTON,
Assistant Professor of Political Science, Hunter College.

COLOMBO PLAN. See COMMONWEALTH OF NATIONS.

COLORADO. Western state, United States; admitted to the Union, Aug. 1, 1876. The "Centennial State" ranks 8th in area and, in 1958, 33d in population among the 50 states.

Area and Population.—Area: 104,247 square miles (land, 103,922; inland water, 325), divided into 63 counties. Population: (1950) 1,325,089; (est., July 1, 1959) 1,775,625. Places with 1950 populations above 10,000:

Aurora	11,421	Fort Collins	14,937
Boulder	19,999	Grand Junction	14,504
Colorado Springs	45,472	Greeley	20,354
Denver (*capital*)	535,000[1]	Pueblo	63,685
Englewood	16,869	Trinidad	12,204

[1] 1959 est. by Colorado State Planning Division.

Executive.—Chief state officers in 1959:
Governor: Stephen L. R. McNichols (Democrat)
Lieutenant Governor: Robert L. Knous
Secretary of State: George J. Baker
Treasurer: Tim Armstrong
Auditor: Homer F. Bedford
Attorney General: Duke W. Dunbar
Commissioner of Education: H. Grant Vest (resigned effective Nov. 15, 1959; succeeded by John Swenson)

Constitution and Judiciary.—The present constitution went into effect in 1876. The Supreme Court comprises 7 justices; chief justice in 1959 was Francis J. Knauss.

Legislature.—The General Assembly (Senate, 35 members; House of Representatives, 65) meets annually commencing the first Wednesday after the first Tuesday in January—for regular sessions in odd-numbered years and for budget sessions in even-numbered years.

The 1959 regular session (January 7–April 21) approved a General Fund appropriation of $71.1 million for the 1959–60 fiscal year and raised basic school support to $25.2 million, including a $1.2 million increase for institutions of higher learning to be used primarily for salary increases. Principal concern, however, lay in changes in the tax structure to meet not only higher general expenditures but to finance a capital construction budget which would be placed under the jurisdiction of a newly formed Joint Budget Committee. Major revisions included an increase from 1% to 3% in the minimum personal income tax bracket and a slight drop from 10% to 9% in the maximum bracket; an increase from 4% to 6% in the withholding rate on lower and middle incomes; and an increase in corporation income taxes by the discontinuance of allowances for federal payments. Liquor taxes were raised; commercial lodgings were taxed; and insurance premium taxes went up to 2¼% on out-of-state firms and 1% on those doing more than one half of their business within the state.

Other legislation created a Department of Rehabilitation; approved the Western Interstate Corrections Compact; and authorized the director of state institutions to select and propose 7 sites for homes for the aged and the state to participate in the 1961 White House Conference on the Aging. Discrimination in the sale or lease of housing because of race, color, creed, or sex, except by individual homeowners or their agents, was prohibited. A point system was established for traffic violators; cities and towns were permitted to build and operate public parking facilities with general taxes or revenue bonds; and the distribution of highway user funds was revised to increase the share received by Colorado cities. In addition, the commissioner of mines was made director of a newly activated Department of Natural Resources; regulations were adopted for the registration and handling of small boats; bingo and raffles were regulated; and businesses issuing checks, drafts, and money orders were required to be bonded and licensed by the bank commissioner.

Finance.—State revenue of $386,744,512.13 for the 1958–59 fiscal year comprised $174,106,116.41 from state tax sources, $96,241,542.64 from the federal government, and $116,396,853.08 from all other sources. Of the tax revenue, $44,390,469.55 was derived from a 2% general sales tax, $49,288,310.64 from individual and corporate income taxes, $39,373,852.65 from motor fuel taxes, $13,623,004.29 from licensing, and the remainder from all other state tax sources. Expenditures of $384,567,760.86 included $61,190,912.73 for education, $141,165,158.97 for health, welfare, and safety, and $90,626,240.58 for highways.

Banking.—On June 30, 1959, Colorado's 84 state banks had assets of $577,514,473.94, demand deposits of $269,397,643.92, and time deposits of $158,972,652.07. The 73 national banks had (Jan. 1, 1959) deposits of $1,866,263,243. There were also (June 30, 1959) 35 state-chartered savings and loan associations with assets of $298,174,546 and 21 that were federally chartered, with assets of $383,328,171.

Education.—School attendance is compulsory between the ages of 6 and 16, inclusive. State and federal aid for public education during the 1959–60 school year amounted to $41,671,002, with the state contributing $33,645,002 ($2,070,002 from special sources) and the federal government, $8,026,000. For the 1958–59 school year, the school-age population (6 to 21) totaled 434,355, with registered students numbering 356,738 on Oct. 1, 1959. There were 13,939 public school teachers, whose salaries averaged $4,669 (high school, $4,834; elementary, $4,546).

Social Welfare.—Public assistance expenditures (excluding operational costs) from county, state, and federal funds in the 1958–59 fiscal year totaled $79,466,781.41, including $61,688,267.01 for the aged, $10,307,998.12 for dependent children, and $4,150,292.01 for the permanently and totally disabled. A monthly average of 73,058 persons received public assistance. The state spent $4,478,063.99 for the operation of penal and correctional institutions.

Labor Force.—The state's employed labor force averaged 535,630 between Jan. 1 and Sept. 1, 1959. In June, employment comprised 565,485 nonagricultural workers and 103,595 agricultural workers; average unemployment for the month was 26,025, or approximately 4% of the total labor

MAJOR COLORADO MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.[1] (thousands of dollars)
All manufactures	77,219	$359,407	$680,983
Food and kindred products	17,861	73,218	177,429
Primary metal industries	9,283[2]	49,706[2]	95,689[2]
Transportation equipment	6,212	37,043	59,832
Chemicals and products	3,866	20,156	58,947
Printing and publishing	6,386	26,675	46,210
Nonelectrical machinery	5,109	24,787	45,614
Stone, clay, glass products	3,128	13,113	28,681

[2] 1956. (Source: *Annual Survey of Manufactures: 1957.*)

force, compared with 4.8% a year earlier. Insured unemployment in June 1959 stood at 3,563, down appreciably from the 7,330 for the previous April.

Manufacturing.—The University of Colorado Bureau of Research estimated that there were 2,265 manufacturing establishments in the state operating full time in 1958. They added $710 million in value through manufacture and paid $243,300,000 in wages and salaries. Expenditures for new plant and equipment in 1957 amounted to $52,808,000.

Mining.—In 1958, Colorado mineral output was valued at $313,965,710. The state ranked first among the states in the production of molybdenum and third in uranium. There were 14,748 persons employed in the state's mineral industries.

COLORADO MINERAL PRODUCTION, 1958

Mineral	Quantity	Value
Crude oil (bbl.)	48,736,367	$144,747,010
Uranium (lb. U_3O_8)	4,634,490	44,769,173
Molybdenum (lb.)	25,079,851	30,472,019
Cement (bbl.)	5,469,417	19,142,962
Gas (Mcf.)	134,208,520	17,424,409

Vanadium (lb.)	6,739,248	12,019,557
Zinc (lb.)	96,586,922	9,948,453
Other minerals	...	21,160,112

(Source: Colorado Bureau of Mines.)

Agriculture.—Cash farm income for the first seven months of 1959 totaled $265,862,000, compared with $261,296,000 for the same period of 1958. For the full year 1958, income comprised $341,151,000 from livestock and livestock products, $227,354,000 from crops, and $20,470,000 from government payments. Principal income sources in 1958 were: cattle, $252,280,000; wheat, $96,308,000; and dairy products, $31,649,000.

In 1958 the state's 42,100 farms had an acreage of 37,541,268 (7,500,000 acres in harvested cropland). Livestock on farms (Jan. 1, 1959) included 2,159,000 cattle, 1,302,000 sheep, and 1,876,000 chickens (excluding commercial broilers). During the week of Oct. 19–25, 1958, there were 88,000 family and hired workers engaged in farming.

COLORADO CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,262	1,520	1,000
Barley (1,000 bu.)	11,474	12,900	14,534
Beans, dry (1,000 bags)	1,864	1,820	1,603
Broomcorn (tons)	7,570	5,600	7,800
Corn (1,000 bu.)	15,511	26,471	24,672
Hay (1,000 tons)	2,352	2,628	2,431
Oats (1,000 bu.)	5,000	4,582	540
Peaches (1,000 bu.)	1,682	1,820	1,850
Pears (1,000 bu.)	188	225	215
Potatoes (1,000 cwt.)	10,387	13,505	11,225
Sorghum grain (1,000 bu.)	4,450	12,454	10,800
Sugar beets (1,000 short tons)	1,881	2,389	2,397
Wheat (1,000 bu.)	37,031	70,236	57,113

Tourism.—Tourist travel in Colorado constitutes the fourth largest industry in the state. As of Oct. 7, 1959, estimates from the University of Colorado Bureau of Business Research indicated an all-time high of more than 4,300,000 visitors in the state during 1959, spending a total of $350 million. Since the end of World War II, the number of Colorado visitors has increased by an average of 11% each year. (See also below, *Principal Events, 1959.*)

Transportation and Communications.—The year 1958 was the greatest highway construction year in the history of Colorado, with a total expenditure of $116,037,815 by the state, the counties, and the cities for improvements to state and county highway systems and city streets. State and federal expenditures for highways in the 1958 calendar year amounted to $78,322,645, and 643 miles of new construction were completed by the state Department of Highways.

Highways and roads on Jan. 1, 1959, totaled 75,680 miles (12,367 surfaced). Registered *motor vehicles* numbered 844,070 on the same date, including 651,931 passenger cars. There were 12 *railroads* operating a total of 4,171.9 miles, and 7 regularly scheduled *airlines* and 73 civil *airfields.*

Communications media in 1959 included 59 AM and 9 FM *radio stations,* 10 *television stations,* and 25 daily and 122 weekly *newspapers.* There were (January 1) 219,000 business and 478,800 residential *telephones.*

Principal Events, 1959.—Colorado's colorful scenery, varied fishing, hunting, and skiing activities, and many places of historical interest have rapidly brought the state forward as one of the nation's most important tourist centers. Each new skiing season alone attracts 50,000 more visitors than in the previous year, and in 1959 an unprecedentedly early snowstorm in September brought skiers to the state six weeks in advance of the usual season. Seven new lakes will be built in the next two years as part of a $1 million fishing improvement program approved by the Colorado Game and Fish Commission.

Of special interest to visitors in 1959 were events associated with the "Rush to the Rockies" centennial celebration. The festivities included the holding of a Federal Fair, near Denver; opera presentations at the Red Rocks Theatre (also near Denver) and at Colorado State College; performance of plays, musicals, and symphonic and chamber music at the University of Colorado and Denver University and at the Aspen music festival and the Rocky Ridge Music Center.

Construction activity in Denver paralleled population growth in the capital city. A new $22.5 million Denver-Hilton Hotel was scheduled to open in March 1960. Also planned or under construction were a $2 million, 16-story apartment house and an $8 million, 12-story office building for the Public Service Company, which had authorized a multimillion dollar expansion of its generating capacity. In another power development, the federal government completed its 4,500-kilowatt hydroelectric plant at the mouth of the Big Thompson Canyon as the final unit in the multimillion dollar Colorado–Big Thompson Reclamation Project.

In October the federal government released 623 acres of land from the Army arsenal installations to Stapleton Field, the Denver municipal airport. This expansion, together with the 252 acres released previously, will enable city authorities to proceed with the construction of a $21 million jet runway.

Denver was politically in the news in 1959 with the election on June 16 of Richard Y. Batterton (Republican) as its new mayor.

The state took pride in the graduation of the first class from the U.S. Air Force Academy at Colorado Springs on June 3. All except two of the 207-man graduating class were commissioned as second lieutenants in the Air Force.

[1] Includes Northern Ireland, Channel Islands, and Isle of Man. [2] Scheduled to become an independent republic during 1960. [3] Includes former British Togoland. [4] Excludes dependencies. [5] Not an integral part of the Commonwealth. [6] Excludes Jammu and Kashmir; includes Sikkim. [7] Includes insular territories.

India, Malaya, New Zealand, Pakistan, and South Africa) and their dependencies, linked through recognition of Queen Elizabeth II as head of the Commonwealth, although India and Pakistan are republics and Malaya is an elective monarchy. While no federal authority over the group exists, similar legal and constitutional backgrounds make for a similar approach to foreign and domestic affairs. Preferential tariffs encourage inter-Commonwealth trade. The fluid structure of the Commonwealth enables it to change as dependent members grow to independence. Each nation defines citizenship for its own people; all are British and Commonwealth citizens. Component parts of the British Commonwealth appear in Table 1.

The Commonwealth Relations Office in London and the departments of external affairs in the self-governing nations are responsible for relations within the group. High commissioners, with ambassadorial rank, are exchanged among Commonwealth members. Governors general represent the crown in nations recognizing royal sovereignty; in dependent territories such representation lies with a governor. The Commonwealth Relations Office and the Foreign Office keep close contact on foreign affairs.

International Relations.—All the independent members belong to the United Nations and the International Labor Organization (ILO), and all except New Zealand are members of the International Bank for Reconstruction and Development (IBRD) and the International Monetary Fund (IMF). The North Atlantic Treaty Organization (NATO) includes Great Britain and Canada, and Great Britain, Australia, New Zealand, and Pakistan belong to the Southeast Asia Treaty Organization (SEATO). Australia and New Zealand are members of the Pacific (ANZUS) Council and, with Great Britain, of the South Pacific Commission. Pakistan and Great Britain belong to the Central Treaty Organization (CENTO; Baghdad Pact), and Great Britain is a member of the Western European Union and the Caribbean Commission. All the independent countries and the Federation of Rhodesia and Nyasaland are contracting parties to the General Agreement on Tariffs and Trade (GATT).

Colombo Plan.—A series of coordinated devel-

opment plans drawn up by the member countries themselves, the Colombo Plan for Cooperative Economic Development in South and Southeast Asia came into operation in 1951. The plan originally called for an estimated expenditure of $5,288.4 million over the period 1951–57, but in 1955 the period was extended to 1961, and a further five-year extension, to 1966, was announced on Nov. 13, 1959.

Members of the plan, with the dates they joined, are Australia (1950), Burma (1952), Cambodia (1951), Canada (1950), Ceylon (1950), Great Britain (1950), India (1950), Indonesia (1953), Japan (1954), Laos (1951), Malaya (1950), Nepal (1952), New Zealand (1950), North Borneo (1950), Pakistan (1950), the Philippines (1954), Sarawak (1950), Singapore (1950), South Vietnam (1951), Thailand (1954), and the United States (1951). Liaison is maintained with the IBRD, the U.N. Economic Commission for Asia and the Far East (ECAFE), and the U.N. Technical Assistance Board (TAB). The Consultative Committee, consisting of representatives of all member countries, held its 11th meeting at Djokjakarta, Indonesia, on Nov. 11–14, 1959. The meeting drew attention to the continuing need for capital and the necessity to encourage private investment, the presence of inflationary pressures, and the problems of rising populations. External assistance had amounted to $5,880 million by June 30, 1959. By that date, 1,194 experts and 8,603 training places had been provided under the Technical Cooperation Scheme, at a cost of £14,300,000, of which £3,190,000 was expended in 1958–59.

Commonwealth Relations.—With the exception of Canada, all Commonwealth countries belong to the sterling area, as do Burma, Iceland, Ireland, Jordan, Libya, and the British protected states in the Persian Gulf. Iraq left the sterling area on June 23, 1959. Commonwealth organizations, such as the Commonwealth Parliamentary Association, Agricultural Bureaux, Scientific Offices, Air Transport Council, Shipping Committee, Telecommunications Board, and Economic Committee, have been established.

Meetings of officials, ministers, and nongovernmental organizations demonstrate Commonwealth cooperation. For example, a Commonwealth Economic Consultative Council met in London on Sept. 22–23, 1959; a survey officers' conference took place at Cambridge on August 17–26; and an education conference was held at Oxford on July 15–29.

A royal tour to Ghana by Queen Elizabeth and the Duke of Edinburgh, planned for November 1959, was postponed on August 7 because the queen was expecting her third child early in 1960, but the duke visited Ghana alone on November 23–28.

Commonwealth External Trade.—A general contraction in world trade in 1958 was reflected in declines of 7% in sterling area exports and of 6% in sterling area imports. This trend continued into 1959, and sterling area exports during the first quarter of the year were 2% below the first quarter of 1958, but by the end of June there was a slight increase compared with the previous year. Changes ranged from a decline of 32% in Pakistan's exports to an increase of 27% in those of Nigeria. Imports into the sterling area fell by 5% during the first quarter of 1959 compared with the first quarter of 1958, changes varying from a decline of about 20% for New Zealand, Rhodesia and Nyasaland, South Africa, and Pakistan to an increase of 23% for Ghana. Statistics for the second quarter indicated a slight rise. Trade figures for the Commonwealth are shown in Table 2.

Table 2—COMMONWEALTH TRADE
(£ million)

	Imports (c.i.f.)		Exports (f.o.b.)	
	1958	1st half 1959	1958	1st half 1959

BRITISH INFORMATION SERVICE

Iain Macleod (left) replaced Alan Lennox-Boyd (right) as colonial secretary in Prime Minister Harold Macmillan's new cabinet after the British general elections in October.

Dependent Territories.—Expenditure under the Colonial Development and Welfare Acts (1945, 1950, 1955) during 1958–59 amounted to nearly £19 million, making a total of £174,988,967 over the 13-year period since 1946–47. A new act, which became law on April 30, 1959, extended the previous acts to March 31, 1964, and made a further £95 million available. About £8 million in loans was raised on the London market in 1958–59 by colonial governments, and a Jamaican loan of $12.5 million was floated on the New York market on Feb. 26, 1959. Local loans, aggregating nearly £7 million, were raised by Aden, Fiji, Sierra Leone, Kenya, and Tanganyika.

The Colonial Development Corporation had 77 projects in operation at the end of 1958, and a profit of £1,174,720 was made on the year's working. Total approved capital expenditure since 1948 amounted to £81,717,000, of which £56,166,000 had been spent. Capital expenditure approved during 1958 amounted to £3 million.

The Commonwealth Development Finance Company had invested £15.5 million by March 31, 1959. On March 5, it announced that it was doubling its authorized capital, to £30 million.

In 1958 the value of colonial exports (see Table 3) fell by £46 million, due largely to declines of £40 million in Singapore's entrepôt trade and of £9 million in sugar exports. The total for

British Chancellor of the Exchequer Derick Heathcoat Amory (r.), with Nigerian Finance Minister Festus Okotie-Eboh, at Commonwealth economic meeting in London, September 22.

WIDE WORLD

the year was £1,256 million. Imports, at £1,554 million, were about £80 million lower than in 1957. The United Kingdom's share of both imports and exports decreased slightly, while that of the United States, Canada, western Europe, and Japan increased. The current account deficit of the colonial territories fell to £74 million in 1958. Total public revenue amounted to £478,007,000, and expenditure to £530,636,000.

Table 3—MAJOR COLONIAL EXPORTS

Commodity	1957	1958
	(thousand long tons)	
Bauxite	6,970	7,382
Calcium phosphate	293	300
Coal	102	98
Copper	441	444
Diamonds (thousand carats)	1,264	2,037
Gold (thousand fine ounces)	147	154
Iron ore	1,445	1,363
Manganese ore	27	22
Petroleum products	13,037	12,885

Sisal	222	241
Pyrethrum extract	77	172
Rubber (raw)	102	102
Timber (million cubic feet)	46	52
Wattle bark extract	26	19

Students at colleges and universities in the territories numbered 3,783 in 1958–59, and at the end of 1958 there were 11,193 colonial students in the United Kingdom and in Ireland.

Following elections in Singapore on May 30, 1959, a new constitution, giving the territory full internal self-government, came into effect on June 3. The elections resulted in a victory for the People's Action Party under Lee Kuan Yew. Discussions between the sultan of Brunei and Colonial Secretary Alan Lennox-Boyd took place in London on March 23–April 6, and a new constitution, coupled with separation from Sarawak, was announced on September 29. (See also BORNEO; SINGAPORE.)

A new constitution giving Jamaica internal self-government came into effect on July 4, and separate governments were set up for the Cayman Islands and the Turks and Caicos Islands. Elections held in Jamaica on July 28 resulted in Norman W. Manley of the People's National Party becoming the island's first prime minister. The cabinet system of government was also introduced into Trinidad on July 20. A Colonial Office statement of January 5 said that it was impossible at present to set up a system of representative government in Malta and announced that the British government would contribute £29 million over a five-year period toward the colony's economic development. An agreement on independence for Cyprus was signed in London on February 19. In the Western Aden Protectorate a Federation of the Arab Emirates of the South was inaugurated on February 11, and Lahej joined it on October 5. (See also ADEN; CYPRUS; MALTA; WEST INDIES FEDERATION.)

The declaration of a state of emergency in Nyasaland and the detention of Dr. Hastings K. Banda and other leaders of the Nyasaland African National Congress led to the appointment on March 24 of a commission of inquiry under Sir Patrick Devlin. The commission's report, published on July 23, justified the declaration of the emergency but found that the charges against Dr. Banda were not entirely proved. Plans for constitutional progress in Nyasaland were suspended during the emergency, but increased African representation on the Executive and Legislative councils was announced on August 24. Elections in Northern Rhodesia, under a constitution of January 1959, took place on March 20. Of 20 seats contested, the United Federal Party won 13. An advisory commission in connection with the 1960 review of the federal constitution was announced on July 21, 1959. (See also RHODESIA AND NYASALAND, FEDERATION OF.)

A new Council of Ministers, including 3 Africans, 1 Asian, and 1 European, was established in Tanganyika on July 1. Political unrest in Buganda, leading to a boycott of non-African trade, led to the proscription of the Uganda National Movement on May 22. In a policy statement on Kenya on April 22, the colonial secretary announced that a constitutional conference would be held in advance of the 1960 Kenya elections. The appointment of Professor W. J. M. Mackenzie as constitutional adviser to the conference was announced on August 20. An inquiry into the deaths on March 3 and later of 11 Mau Mau detainees at the Hola camp led to the appointment of a committee, which found (July 18) deficiencies in the administration of detainee camps. A new land policy designed to open the White Highlands to farmers of all races was presented to the Legislative Council on October 13, and plans to end the emergency resulting from the Mau Mau were announced on November 10. (See also BRITISH EAST AFRICA.)

Self-government came to the Northern Region of Nigeria on March 15. A plebiscite held in the Northern Cameroons on November 7 resulted in a decision to continue under trusteeship rather than become a part of Nigeria when the latter attained independence in October 1960. Elections to the federal House of Representatives of Nigeria were held on December 12. A statement made by the colonial secretary at Hargeisa on February 9 announced acceleration of constitutional development in the Somaliland Protectorate to bring it in line as soon as possible with the trust territory of Somaliland. (See also BRITISH CAMEROONS; BRITISH WEST AFRICA; SOMALILAND PROTECTORATE.)

RICHARD E. WEBB,
Director, Reference and Library Division, British Information Services.

COMMUNICATIONS. See Index entry.

COMMUNISM. During 1959, Moscow-aligned Communist governments ruled 16 countries: the Soviet Union, Estonia, Latvia, Lithuania, Poland, the German Democratic Republic (East Germany), Czechoslovakia, Rumania, Hungary, Bulgaria, Albania, the Mongolian People's Republic (Outer Mongolia), the Chinese People's Republic, the Korean Democratic Republic (North Korea), Tibet, and North Vietnam. In addition, Yugoslavia was governed by Communists independent of Moscow's control. Altogether, approximately one third of the world's population lived under Communist rule in 1959.

World Communist Strength.—In 1959 the Soviet press claimed that the Communist and Communist-front labor parties of the world had a total membership of 33 million. Of this total, about 28 million lived within the Soviet orbit. The largest Communist party was the Chinese, with 12,720,000 members. The second largest was the Communist Party of the Soviet Union, with 8,239,000 members. The Soviet satellites of eastern Europe

contained over 5 million Communists. Outside of Communist China, the Communist countries of the Far East had almost 2 million party members.

The accompanying table shows the numerical strength of Communist parties in major countries.

WORLD COMMUNIST STRENGTH, 1959

Country	Membership
Africa	
Algeria	10,000
Morocco	1,500
Sudan	750
Tunisia	500
Union of South Africa	2,000
Europe	
Albania[1]	50,000
Austria	50,000
Belgium	12,000
Bulgaria	484,000
Czechoslovakia	1,422,200
Denmark	11,000
Finland	30,000
France	430,000
Germany, East[2]	1,200,000
Germany, West	50,000
Greece	20,000
Hungary[3]	410,000
Iceland[4]	1,000
Italy	1,700,000
Luxembourg	500
Netherlands	15,000
Norway	5,000
Poland[5]	1,052,800
Portugal	9,000
Rumania	720,000
Spain	5,000
Sweden	24,000
Switzerland[6]	6,000
USSR	8,239,000
United Kingdom	27,000
Yugoslavia[7]	899,300
Far East	
Australia	5,500
Burma	10,000
Cambodia	1,000
Ceylon	4,000
China, Communist	12,720,000
India	250,000
Indonesia	1,000,000
Japan	80,000
Korea, North[8]	1,164,200
Laos	4,000
Malaya	5,000
Mongolian People's Republic[9]	36,300
Nepal	3,500
New Zealand	400
Pakistan	3,500
Philippines	1,500
Thailand	5,000
Vietnam, North[10]	620,000
Vietnam, South	2,000
Middle East	
Cyprus	6,000
Iran[11]	2,000
Iraq	1,000
Israel	2,000
Jordan	250
Lebanon	4,000
Turkey	3,000
United Arab Republic	8,000
North America	
Canada	6,000
Costa Rica[12]	300
Cuba[13]	12,000
El Salvador	500
Guadeloupe	3,000
Guatemala[14]	1,000

[7] League of Communists. [8] Korean Workers' Party. [9] Mongolian People's Revolutionary Party. [10] Lao Dong (Workers) Party. [11] Tudeh Party. [12] People's Vanguard Party. [13] People's Socialist Party. [14] Guatemalan Labor Party. [15] Nicaraguan Socialist Party. [16] People's Progressive Party. (Source: table compiled by the author from numerous sources.)

Communist Dissension.—During 1959 there was evidence of some dissension among Communist-ruled nations. The quarrel between the Yugoslav League of Communists and the Soviet Union continued. On January 27, at the opening session of the 21st congress of the Soviet Communist Party, the first secretary of the party's Central Committee, Nikita S. Khrushchev, severely criticized Yugoslavia for permitting the existence of private farms, imprisoning pro-Soviet Communists, revising Marxism, allying itself with Turkey and Greece, and aiding the North Atlantic Treaty Organization (NATO). The Chinese Communist press also accused the Yugoslavs of attempting to create a rift between the USSR and Communist China.

Meanwhile, within the Soviet bloc itself, various nations were following contradictory policies. Poland permitted large-scale private farming, while neighboring Rumania and Hungary were engaged in campaigns to collectivize all agriculture. The USSR was relaxing some state controls over collective farms and farmers, while Communist China was forcing its peasants into communes where daily life was almost as severely regimented as in a prison camp. In January the East German Communist press declared that communes were suitable for China, but should not be introduced in other nations of the Soviet bloc.

Europe.—The largest concentration of Communists in the free world in 1959 was in Europe, where almost 2½ million party members resided. However a general decline in the strength of European Communist parties was apparent. The party was illegal in Cyprus, Greece, Ireland, Portugal, Spain, and West Germany.

In general, European Communists opposed NATO, the European Economic Community, West German rearmament, the De Gaulle government in France, the presence of United States troops in Europe, and the stationing of United States missiles in European countries. Communists demanded more European trade with the USSR, and, in south Europe, the return of Cyprus to Greece.

Communist parties were unable to elect a single candidate to office in the parliamentary elections held in Austria in May and Great Britain in October, and Iceland's United Labor (Communist) Party lost about 25% of its popular vote in the June elections. In April elections, Communists won only 14 of the total 255 seats in the French Senate, but much greater Communist strength was displayed in the French municipal elections in March.

Far East.—There were more than 1,375,000 Communists in the free countries of the Far East in 1959, with party membership tending to increase. The main goal of Asian Communists was to ally with Socialists and seize control of their respective countries by parliamentary means. Communist parties were illegal in Afghanistan, Burma, Malaya, Pakistan, the Philippines, South Korea, South Vietnam, Taiwan and Thailand.

Communist propaganda in the Far East was aimed mainly at weakening American and western European influence. The Japanese Communists demanded more Japanese trade with Communist China, rupture of the United States–Japanese military alliance, withdrawal of American troops from Japan, and the complete disarmament and neutralization of the Japanese nation. The Indonesian Communist Party urged the nationalization of all Dutch commercial, industrial, and agricultural enterprises in Indonesia. However, the same party opposed some aspects of the new program of "guided democracy" of the Indonesian government.

Small Communist guerrilla bands continued to fight the established governments in Burma, Malaya, and the Philippines. Much more serious was the large-scale Pathet Lao (Communist) uprising which began in Laos during May and continued sporadically throughout the year.

After widespread anti-Communist demonstrations in the Indian state of Kerala during June and July, the Indian federal government dissolved the Communist-led state government of Kerala. Indian Communists led extensive food riots in Calcutta in early September. The Chinese Communist invasion of the frontier zone in northern India caused a split in the Indian Communist Party, some of whose members wanted India to repel the invasion.

In Nepal's first parliamentary elections in February, Communist candidates won only 4 of the total 109 seats in the lower house of the Nepalese parliament. (See also FAR EAST.)

Middle East and Africa.—The Communist parties of the Middle East generally pursued pro-Arab, anti-Israel, and anti-Western policies in 1959. Their main goal was to destroy Anglo-American influence in the Middle East. Communists opposed the Central Treaty Organization and United States military aid to Turkey and Iran. Communist in-

fluence was very strong in Iraq, where in June the National Democratic, United Kurd Democratic, and Communist parties joined together to form a National United Front.

Communist parties were illegal in Iran, Jordan, Lebanon, Saudi Arabia, Turkey, the United Arab Republic, and Yemen. During January and March about 1,000 Communists were arrested in Egypt and Syria on charges of conspiracy to overthrow the government of the United Arab Republic. In May, Lebanon deported approximately 50 foreign Communists.

Africa had perhaps 50,000 Communists in 1959. In North Africa, Communists demanded Algerian independence and the removal of United States airbases from Algeria and Morocco. South of the Sahara, Communists agitated for colonial freedom, especially in the Belgian Congo. Communist parties were illegal in Algeria, the Sudan, and the Union of South Africa. In September, Morocco ordered its Communist Party to cease political activity. (See also AFRICA; MIDDLE EAST.)

Latin America.—Latin America contained about 240,000 Communists in 1959, with party membership tending to increase. Communist parties were illegal in Brazil, Costa Rica, the Dominican Republic, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, Panama, Paraguay, and Peru. The Argentine government banned Communist political activity in April and initiated court action in October to disfranchise the Communist Party.

As before, Latin American Communists in 1959 devoted most of their activity to combating United States political, economic, and military influence in their respective countries. Communist parties opposed the Organization of American States and called for increased Latin American trade with the Soviet bloc of nations. The Cuban People's Socialist (Communist) Party supported Fidel Castro's seizure of power in Cuba, and Communist propaganda described Castro as the best example of Latin American "progressive bourgeoisie," with which Communist parties should cooperate. On September 2, Dionisio Encina, the secretary general of the Mexican Communist Party, was arrested by the Mexican government on charges of possessing subversive propaganda. (See also INTER-AMERICAN AFFAIRS.)

Canada.—On Oct. 11, 1959, the Canadian Labour-Progressive Party renamed itself the Communist Party of Canada, thus resuming the name it had used before World War II. The party in 1959 had a membership of about 6,000, which represented a great decline from the 1956 membership of 16,000. It is an almost entirely urban organization consisting of industrial workers, white-collar employees, and college students. One fourth of the total membership resides in or near the city of Toronto. Though small in numbers, the party is active in the trade unions of the electronics, mining, smelting, and shipbuilding industries. Party slogans in 1959 called for Canadian disarmament, recognition of Communist China, more trade with Communist countries, and an end to the Canadian military alliance with the United States.

United States.—During 1959 the membership of the Communist Party of the United States remained at the low level of about 7,000, a great decline from the 1955 membership of 22,700. This decline resulted from a mass wave of resignations, due either to members' disillusionment with communism or to their fear of losing jobs in business, education, or government. However, in its annual report issued in March 1959, the Un-American Activities Committee of the House of Representatives warned that many persons who resigned because of fear still actively support the Communist cause, even though they no longer possess party membership cards. The United States Communist Party is primarily urban, with its greatest concentration of members in New York City and southern California. (See also FEDERAL BUREAU OF INVESTIGATION.)

Party slogans in 1959 called for United States recognition of Communist China, admission of China to the United Nations, withdrawal of United States armed forces from Taiwan, cessation of American military aid to the free nations of Europe and Asia, and expansion of trade with the USSR. A major change in internal party policy in 1959 was the abandonment of the previous demand for the creation of an autonomous Negro republic within the United States. Instead, the party now stands for Negro and white integration.

After a third investigation, the Subversive Activities Control Board of the United States government declared on Feb. 9, 1959, that the United States Communist Party is dominated by Moscow, and asked the U.S. Court of Appeals, Washington, D.C., to order the party to register with the Department of Justice as a Communist-action association. Accordingly, on July 30, the court ordered the party to register its income, expenditures, and the names and addresses of its members. The party refused and appealed the case to the Supreme Court.

On April 15 the U.S. Court of Appeals, Denver, Colo., resentenced 6 local Communist Party leaders to prison terms of 2½ to 5 years and fines of $1,500 to $5,000, for conspiracy to overthrow the United States government. The Communists—Arthur Barry, Mrs. Patricia Blau, Anna Correa, Joseph Scherrer, Maia Scherrer, and Harold Zepelin—had appealed a previous conviction on the same charge.

On June 29 the Supreme Court decided that defense industry workers in private plants have the right to cross-examine their accusers before being dismissed on charges of being Communists or security risks.

At the International Youth Festival (a Communist-front gathering) in Vienna, July 26 to August 4, the 400-man United States delegation split into the pro-Communist New York group, headed by Marvin Markman, and the independent Chicago group, which was discriminated against by the festival authorities.

The 17th national convention of the Communist Party of the United States (held December 10–14 in New York City) elected Gus Hall as the party's general secretary, Eugene Dennis as chairman, and Benjamin J. Davis as national secretary.

ELLSWORTH RAYMOND,
USSR Area Specialist, and Associate Professor of Government, New York University.

COMMUNITY CHESTS. See UNITED FUNDS AND COMMUNITY CHESTS.

COMMUNITY TRUSTS. Aggregate assets of community trusts in the United States and Canada rose to $282,111,434 at the beginning of 1959, from $227,191,098 a year earlier. Among the larger community foundations and their holdings are: Cleveland Foundation, $36,009,930; New York Community Trust, $32,818,699; Chicago Community Trust, $28,911,238; Boston Permanent Charity Fund, $25,108,574; and Kalamazoo (Mich.) Foundation, $21,086,979.

Philanthropic grants by these organizations aggregated $10,005,634 in 1958, compared with $8,-

777,996 in 1957. Community trusts making the largest disbursements were those in New York City, with $1,400,346; Chicago, $1,188,400; Cleveland, $1,016,606; and Boston, $730,815. Funds newly received by community trusts during 1958 totaled: in Chicago, $5,662,389; in Cleveland, $1,240,913; in Oshkosh (Wis.), $916,096; in Pittsburgh (Pa.), $804,344; and in Hartford (Conn.), $769,934.

A total of 1,608 separate funds were under community trust administration in 1958, compared with 1,526 a year earlier. Winnipeg (Manitoba) had 150 of these; Rochester (N.Y.), 142; and New York City, 129. Upward of 89% of the reported resources are already in hand, the remainder being deferred pending the completion of preceding "life uses."

RALPH HAYES,
Director, The New York Community Trust.

COMORO ISLANDS. A French overseas territory comprising four main islands (Grande Comore, Mayotte, Anjouan, and Mohéli) and several islets, situated between Africa and the island of Madagascar. Area, 838 square miles (of which Grande Comore comprises 444); pop. (est. 1958), 182,000, including about 1,000 nonindigenous persons, mainly French. The natives are Moslems of mixed Arab and Malagasy descent. Dzaoudzi (est. 3,000), on Mayotte, is the capital.

In the referendum of Sept. 28, 1958, the Comoro Islands voted approval of the new French Constitution, and on Dec. 11, 1958, chose to retain the status of a French overseas territory with representation in the French Parliament and administrative autonomy. French President Charles de Gaulle visited the territory on July 9, 1959. The Territorial Assembly is elected on the basis of a single electoral college. The assembly choses a Government Council which has executive powers. The ordinary budget for 1958 totaled 289 million francs CFA; the extraordinary budget, 25 million. In 1958 there were 35 elementary schools (2,743 pupils) and 1 secondary school (117).

Food crops include rice, cassava, and sugar cane. Chief cash crops and 1958 exports (in metric tons) were: vanilla, 53; essential oils 33; copra, 2,611; and sisal, 484. Industries include a sawmill, coconut oil and sugar refineries, an essence distillery, and a soap factory. Exports in 1958 totaled 565.2 million francs CFA; imports, 711.2 million. Trade is mainly with France and the Malgache Republic.

CONFECTIONERY. According to the U.S. Bureau of the Census, sales of confectionery and competitive chocolate products were valued at $1,120 million in 1958, more than 5½% above the 1957 figure of $1,060 million. Data in the accompanying table represent approximately 93% of manufacturers' total sales.

CONFECTIONERY AND CHOCOLATE PRODUCTS: SALES BY TYPE OF PRODUCT, 1958[1]

Type of product	Pounds (1,000)	Value ($1,000)
Package goods:		
$1.00 or more per lb.	112,928	111,715
$0.50 to $0.99 per lb.	215,462	106,665
Less than $0.50 per lb.	607,950	173,767

[1] Not including manufacturer-retailers' sales.

Sales through September 1959, estimated at $800,176,000, were 4% above the 1958 level.

CONGO. The Republic of Congo is an autonomous republic of the French Community (q.v.), situated in west-central Africa. Estimated area, 134,750 square miles; pop. (est. mid-1958) 780,000, including (in 1956) 10,429 nonindigenous persons, mainly French. Chief cities are Brazzaville, the capital (est. pop., 99,144), and Pointe-Noire (37,376), the chief port.

Government.—The Republic of Congo was formerly the French overseas territory of Middle Congo, included within the federation of French Equatorial Africa. On Nov. 28, 1958, the territory chose the status of a member state of the French Community. As an autonomous republic, Congo has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic materials, and certain other matters. The republic adopted its constitution on Feb. 23, 1959. The Legislative Assembly consists of 61 members elected by universal suffrage for a five-year term. The assembly chooses a premier, who forms his ministry. On July 4, 1959, Fulbert Youlou, leader of the Democratic Union for the Defense of African Interests, formed a government which included two members of the opposition African Socialist Movement and three Europeans.

Education and Religion.—In 1958 there were 517 schools with a total of 82,221 pupils (72.1% of the school-age population, the highest proportion of the French African territories). Expenditure on education totaled 1,205.3 million metropolitan francs, or 26.2% of the budget. The natives are mostly animists, although there are a few predominantly Christian areas.

Transportation.—The Congo-Ocean Railroad, the republic's only railway, extends 318 miles from Brazzaville to Pointe-Noire. Roads and trails total about 5,000 miles (1956), including 238 miles of hard-surfaced roads and 4,099 of all-weather trails. The chief airports are at Brazzaville (of international class) and Pointe-Noire.

Production and Trade.—Economic development has thus far been confined mainly to the south. Agriculture is the chief occupation and an important source of exports. Industries are mainly local and include vegetable-oil refineries, soap factories, and small smelting works and foundries. Lumber from the tropical forests constitutes the leading export. Lead ore, zinc ore, and gold are mined on a small scale. A dam is under construction on the Kouilou River north of Pointe-Noire. Exports in 1958 totaled 7.8 billion metropolitan francs; imports, 22 billion. Chief exports are lumber (189,000 metric tons in 1958), palm oil, palm kernels, peanuts, lead ore, and tobacco.

Principal Events, 1959.—On February 16, riots broke out in Brazzaville between supporters of Jacques Opangault, leader of the oppositionist African Socialist Movement (MSA), and supporters of Premier Fulbert Youlou. The rioting took on the character of tribal warfare, with the M'Bochis of the north favoring Opangault, and the Balalis supporting Youlou. The disorders lasted for several days, left a reported 120 persons dead, and were finally put down by the intervention of French troops at the request of Premier Youlou. Elections took place on June 14, with Youlou's party (the local branch of the pro-French African Democratic Rally) winning 51 seats in the Legislative Assembly, to 10 for the MSA. Following the elections, Opangault was released from prison, where he had been held on charges of sedition in connection with the February rioting, and Youlou formed a new government on July 4 which included two members of the MSA.

CONGO, Belgian. See BELGIAN CONGO.

CONGREGATIONAL CHRISTIAN CHURCHES. The union between these churches and the Evangelical and Reformed Church under the name of United Church of Christ was advanced toward consummation in 1959 by the second meeting of the General Synod of the United Church. Progress was reported there in bringing together the men's, women's, and young people's organizations of the two denominations, in uniting the benevolent boards, in forming a united Council for Christian Social Action, and in publishing the *United Church Her-*

ald. A Statement of Faith to serve as a testimony, not a test, and a Call to Christian Action in Society were adopted. The vital step toward consummating the union by adopting a constitution was forwarded by receiving with satisfaction as to its main features the report of the Committee on Constitution and referring it to the churches and synods for study and suggestion of desirable changes. These suggestions are to be considered by the committee, and a revised report will be made to an adjourned meeting of the General Synod in July 1960. This will make possible the submission of the constitution to the churches and synods for ratification and, if ratified, its final adoption at the General Synod to be held in Philadelphia in 1961.

Representatives of other church groups have participated in an advisory capacity in the framing of this constitution, the Basis of Union provision having expressed the hope that the name "United Church of Christ" might lead other bodies to come into the union and thus form "a more inclusive United Church."

That the Congregational Christian churches intend to go into this union strengthened in a highly important area of their work is shown by the effort begun in 1959 to raise a fund of $7,500,000 for higher education.

Statistics for the Congregational Christian Churches (as of Jan. 1, 1959): number of churches, 5,506; church membership, 1,401,565; church school membership, 768,940; ministers in full standing (including 3,429 pastors), 6,041; legacies (575 churches reporting), $3,065,022; home expenses (4,832 churches reporting), $57,533,522; benevolences (4,905 churches reporting), $10,155,582; value of church property (5,163 churches reporting), $606,294,174.

CONNECTICUT. New England state, United States; one of the original 13 states. The "Nutmeg State" or "Constitution State" ranks 48th in area and 26th in population among the 50 states.

Area and Population.—Area: 5,009 square miles (land, 4,899; inland water, 110), divided into 8 counties. Population: (1950) 2,007,280; (est., July 1, 1958) 2,363,000. Towns (defining civil divisions), cities, and boroughs with populations above 15,000 (as estimated by the State Department of Health for July 1, 1959) are:

Ansonia	20,100	New London	31,900
Bridgeport	169,300	Norwalk	65,600
Bristol	46,900	Norwich	39,400
Danbury town	42,700	Shelton	17,100
Darien town	15,900	Southington town	17,500
East Hartford town	37,500	Stamford	89,300
East Haven town	19,000	Stonington town	17,400
Enfield town	24,800	Stratford town	44,600
Fairfield town	42,400	Torrington	30,300
Greenwich town	52,900	Trumbull town	15,900
Groton town	27,100	Vernon town	17,700
Hamden town	39,200	Wallingford town	27,200
Hartford (*capital*)	185,600	Waterbury	114,800
Manchester town	40,200	Waterford town	15,700
Meriden	51,900	West Hartford town	58,500
Middletown	31,600	West Haven town	38,000
Milford town	39,500	Westport town	17,200
Naugatuck	19,600	Wethersfield town	18,000
New Britain	88,100	Windham town	18,500
New Haven	168,500	Windsor town	17,100

Executive.—Chief state officers in 1959:
Governor: Abraham Ribicoff (Democrat)
Lieutenant Governor: John N. Dempsey
Secretary of State: Ella T. Grasso
Treasurer: John A. Speziale
Attorney General: Albert L. Coles
Commissioner of Education: William J. Sanders

Constitution and Judiciary.—The present constitution went into effect in 1818. The highest tribunal, the Supreme Court of Errors, comprises five justices; chief justice, Raymond E. Baldwin.

Legislature.—The General Assembly (Senate, 36 members, House of Representatives, 279) convened in its regular biennial session on January 7, and adjourned June 3, 1959.

Of the near-record 3,333 bills introduced, 1,237 became law and 31 were vetoed. The more important enactments included the abolition of county government, effective Oct. 1, 1960; the creation of a circuit court system consisting of 44 full-time judges to replace in 1961 the present trial justice and municipal courts; adoption of an operating budget of $541 million without any new taxes; and the approval of a $346 million, four-year, bond-financed highway building program. Other important measures provided for an increase in unemployment compensation benefits from $40 to $45 per week; a major change in the legislators' biennial salary from $600 to $2,000, effective with the 1961 session; the authorization of a $57 million bond issue for capital improvements; a merger of the Office of Civil Defense with the Military Department; the creation of a new Department of Consumer Protection (the first of its kind in the United States), which consolidated several inspection agencies, with the Food and Drug Commission as the nucleus; the prohibition of discrimination in the sale or rental of housing consisting of five or more units; the transfer of the responsibility for the Merritt Parkway from an abolished commission to the state Highway Department; and a major governmental reorganization in which, among others, a Department of Agriculture, Conservation and Natural Resources was created and the Health Department was considerably enlarged to include public health, mental retardation, and tuberculosis control and care.

Finance.—In the 1958–59 fiscal year, state revenue of $377,792,075.24 comprised $229,175,698.98 from state tax sources, $54,031,968.02 from the federal government, and $94,584,408.24 from all other sources. Tax revenue included $71,917,375.39 from a 3% general sales tax, $27,301,368.91 from corporate income taxes, $45,475,879.68 from motor fuel taxes, and $16,779,989.40 from licensing. Expenditures of $509,877,334.91 consisted of $97,480,805.34 for education, $246,117,601.47 for health, welfare, and safety, $127,745,822.74 for highways, and $38,533,105.36 for all other purposes. State long-term indebtedness on June 30, 1959, amounted to $574,263,000, of which $429,881,000 was self-liquidating.

Banking.—As of June 10, 1959, the state's 26 national banks had $1,179,685,000 in assets, $773,593,000 in demand deposits, and $266,872,000 in time deposits. The 121 state banks (Dec. 31, 1958) had assets of $3,804,641,600, demand deposits of $852,215,000, and time deposits of $2,568,626,000.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $145,702,207 ($333.81 per pupil), including $104,023,914 from local school districts, $39,808,130 from the state, and $1,870,163 from the federal government. Outlays for construction and improvements amounted to $41,065,809.37, and teachers' salaries averaged $5,117 (high school, $5,361; elementary, $4,977).

CONNECTICUT SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (k-6; k-8)	759	10,367	312,884
Public junior high (7–9)	53	1,733	35,647
Public senior high (10–12)	108	4,206	93,296
Private and parochial elementary and secondary	264	3,245	87,319
Public vocational	14	357	5,696
Junior colleges	4	...	855
Teachers colleges	4	...	3,583
Colleges and universities	18	...	17,880
Other higher institutions	4	...	872

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $40,255,879.20, including $19,747,749 for the aged, $13,425,717 for dependent children, and $3,321,005 for the permanently and totally disabled. A

monthly average of 24,468 persons received public assistance. The state spent $28,251,183 for all mental health activities, including 2 hospitals for the mentally deficient and epileptic (average population, 3,486) and 5 hospitals for the mentally ill (8,856). Correctional and penal programs cost $5,263,079 and included 2 training schools for delinquents (405), 1 reformatory (422), and 2 prisons (1,139).

Labor Force.—The state's labor force totaled 1,076,800 in June 1959, including 25,900 agricultural workers. Nonagricultural employment was up to 892,700 from 869,300 in the previous June and also above the 867,690 average for 1958. Manufacturing accounted for 44.9% of the nonfarm total; trade, 17.5%; and service industries, 11.2%. With the economy on the rebound, unemployment dropped to 60,500 in June 1959 from the previous June's total of 107,300. Unemployment compensation payments for the fiscal year 1958–59, reflecting the earlier high unemployment figure, amounted to $78,759,114.

Manufacturing.—The state's 4,529 manufacturing plants in 1958 employed an average of 387,700 persons who received $1,974,232,144 in wages. Value added by manufacture (1957) totaled $3,601,861,000, and outlays for new plant and equipment amounted to $224,518,000. Production workers in manufacturing averaged $92.70 for an average workweek of 41.2 hours in August 1959.

MAJOR CONNECTICUT MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.[1] (thousands of dollars)
Nonelectrical machinery	76,005	$391,454	$697,302
Transportation equipment	79,766	434,004	690,670
Electrical machinery	35,674	158,594	329,425
Fabricated metal products	43,901	201,806	324,744
Primary metal industries	27,822	142,784	248,764
Chemicals and products	11,709	60,570	165,294
Food and kindred products	11,855	54,561	137,825
Textile mill products	24,081	94,137	134,897
Printing and publishing	15,414	78,630	133,745
Rubber products	12,752	61,170	115,065

[1] For definition, see text footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—Connecticut ranked 45th among the states in the value of its mineral output in 1958, with 0.08% of the national total. Sand, gravel, and stone yielded 94% of the state's total value of mineral production.

CONNECTICUT MINERAL PRODUCTION, 1958

Mineral	Quantity	Value
Clays	198,831	$ 299,000
Lime	28,996	464,000
Peat	1,764	11,000
Sand and gravel	5,019,000	5,479,000
Stone	4,223,000	6,863,000
Other minerals	...	92,000
Total	...	$13,128,000*

* Total adjusted to eliminate duplication in the value of clay and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $112,750,000 from $124,239,000 for the same period in 1958. For the full year 1958, income comprised $111,221,000 from livestock and livestock products, $55,487,000 from crops, and $2,243,000 from government payments. Principal income sources in 1958 included: dairy products, $44,544,000; eggs, $32,141,000; broilers, $20,436,000; and tobacco, $20,170,000. Forest, greenhouse, and nursery products yielded $20,171,000.

The state's 13,700 farms (1958) had a total acreage (1954) of 1,138,000 (286,000 acres in harvested cropland). Livestock on farms (Jan. 1, 1959) included 155,000 cattle and 4,106,000 chickens (excluding commercial broilers). Farming engaged 20,496 hired workers in 1959.

CONNECTICUT CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,309	1,040	1,350
Corn (1,000 bu.)	1,802	2,120	2,132
Hay (1,000 tons)	403	419	381
Potatoes (1,000 cwt.)	1,361[1]	1,374	1,311
Tobacco (1,000 lb.)	22,686	11,750	13,940

[1] 9-year average, 1949–57. (Source: U.S. Department of Agriculture.)

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $75,174,000, and 191.6 miles of new construction were completed.

Highways and roads on Dec. 31, 1958, totaled 16,148 miles (14,661 surfaced). Registered *motor vehicles* numbered 1,029,656 on July 31, 1959, including 854,369 passenger cars. There were (1958) 3 *railroads* operating 824.63 line miles, and (1959) 6 regularly scheduled *airlines* and 56 *airports and airfields* (3 state, 5 municipal, 16 commercial, and 32 private) in addition to 15 heliports and 6 private and 4 commercial seaplane bases.

Communications media (1959) included 29 AM and 8 FM *radio stations;* 2 VHF and 2 UHF *television stations;* 25 daily *newspapers* (circulation, 762,896) and 157 other newspapers and magazines; and (January 1) 326,000 business and 865,800 residential *telephones.*

Principal Events, 1959.—Political history was made during the 1959 General Assembly when, for the first time in 82 years, both houses were controlled by the Democrats, who also held all elective state executive offices. All major proposals of the Ribicoff administration were enacted. Two far-reaching changes will abolish two systems which have existed since colonial times—county government and the minor courts. Present county functions will be assumed by the state government, and the minor courts will be replaced by a circuit court system consisting of 44 full-time judges. (See also above, *Legislature.*)

In keeping the campaign promise of no new taxes, the Democrats introduced several financing procedures which were unusual to Connecticut. These included the use of motor vehicle fee income for financing educational grants to towns, the curtailment of both state agency expansion and any increase in the operations of state institutions, and the approval to issue bonds to finance state grants for school buildings.

The House of Representatives passed several resolutions as the first step necessary to amend the state constitution. Among these were one requiring a three-fifths majority vote in the General Assembly to override a governor's veto; another to require that the governor and lieutenant governor

be paired in each election to avoid the election of members of different parties; and another to retain for six months the privilege of a citizen to vote after moving from one town to another in the state.

The economy of Connecticut improved mildly in the first nine months of 1959. Total nonagricultural employment in September 1959 was 2.7% higher than a year earlier. The State Tax Department reported a substantial increase in returns for the first three months of the fiscal year beginning in July 1959, as contrasted with the same period the year before. Connecticut continued in 1958 to lead the nation with a per capita personal income of $2,817. This was 47.6% higher than the 1950 figure for the state.

In connection with the elimination by the legislature of the Greater Hartford Bridge Authority, two of the five bridges in the Hartford area were made toll-free on Oct. 1, 1959. Construction in Hartford's first redevelopment area was scheduled to begin early in 1960, and Vincent B. Coffin, first chancellor of the University of Hartford, launched an $8 million building campaign for the institution's new 150-acre campus in West Hartford. At nearby Bradley Field, the state's major commercial airport, enlarged runway facilities were dedicated on October 3 in preparation for jet plane service.

In New Haven, where major redevelopment activities continued throughout the year, a 16-story skyscraper, University Towers, was expected to be completed in 1960. At Groton the largest antibiotic plant in the world was scheduled for completion by the start of 1960, and the world's largest atomic submarine, the *Triton*, was commissioned by the U.S. Navy on Nov. 10, 1959. In July the town of Norwich celebrated the tercentenary of its founding with a week-long series of events.

On July 20, 1959, Chief Justice Edward J. Daly of the Supreme Court of Errors died, and Raymond E. Baldwin was appointed to succeed him. When Baldwin was sworn in a week later, he became the only person in the history of Connecticut to have filled the state's three top posts—governor, U.S. senator, and chief justice.

CONSUMER CREDIT. During the first three quarters of 1959 consumer credit in the United States increased approximately $3.8 billion. In the same period a year earlier it decreased $1.6 billion. This shift reflected a substantial improvement in economic conditions, and particularly a sharp increase in demand for consumer durable goods (for example, new passenger cars and household equipment). All of the increase in consumer credit was in the form of expanded installment credit.[1] In the first two months of 1959 consumer credit declined appreciably from the high level at the end of December 1958. This decline was largely the result of a seasonal reduction in the use of noninstallment credit, particularly charge accounts at stores. Thereafter, the rapid expansion of installment credit raised the total of consumer credit to a record level of $49.4 billion at the end of the third quarter. Although this expansion was rapid and substantial, it was probably restrained in part by the restrictive credit policy of the Federal Reserve System (see BANKING).

The increase of installment credit in the first three quarters approached the expansion of 1955 when the record increase of total consumer credit for the year was $6.4 billion, of which $5.4 billion was installment credit (mainly for automobile purchases). However, the amount of consumer credit outstanding at the end of the third quarter was not excessive relative to other changes in the economy as compared with previous years. For instance, in the two years prior to 1942, consumer credit was about 11% of disposable personal income. This percentage rose slightly after World War II, and since 1954 has varied from 13% to 14%. The new, higher level of consumer credit developed largely because of the use of such credit by more middle-income families rather than because of an increase in consumer debt relative to the incomes of credit-using families. At the end of the third quarter in 1959 the ratio of consumer credit to disposable personal income continued to be within the range of 13% to 14%. Moreover, there was no indication of a repetition of the distorted consumer credit pattern of 1955, when a too-rapid extension of installment credit and relaxation of terms (minimum down payments and maximum repayment periods) contributed to a bunching of sales, particularly of automobiles, and a decline in the following year. Only a moderate expansion of consumer credit was expected in the fourth quarter of 1959 because of restrictive banking policies, and the prolonged steel strike (see IRON AND STEEL), which checked appreciably the rising trends in employment, income, and output of consumer durable goods.

Status of Consumer Credit, December 1958—At the end of December 1958 the major portion of the $45.6 billion of consumer credit was installment credit totaling $34.1 billion. It included $14.2 billion of installment sale credit on automobiles provided by sales finance companies, commercial banks, and automobile dealers. Installment credit for other consumer goods, secured by the items purchased, amounted to $8.9 billion, and was provided by commercial banks, department stores, mail-order houses, furniture stores, and other retail outlets. Repair and modernization installment loans for owner-occupied dwellings totaled $2.4 billion, extended mainly by commercial banks. Other personal loans of an installment type amounted to $8.6 billion, granted mainly by commercial banks and other financial institutions.

The minor portion of the $45.6 billion of consumer credit was noninstallment credit of $11.5 billion. It consisted of $3.6 billion of single-payment loans extended mainly by commercial banks. Charge accounts at stores amounted to $5.1 billion. Service credit, the amount owed by individuals to professional practitioners and service establishments which includes the use of credit cards, totaled $2.8 billion.

Trends in Consumer Credit, 1959.—At the end of September 1959, consumer credit was $3.3 billion, or approximately 8% above the level at the end of 1958, and about 13% above the level of the previous September. Installment credit was almost 12% above the year-end level, and 14% above the level of September 1958; noninstallment credit was 1% below the year-end level, but approximately 9% above the September 1958 level. Automobile credit, the largest component in installment credit, increased almost 16% in the first three quarters of 1959; other durable goods credit increased about 5%; and both repair and modernization loans and personal loans increased approximately 10%. Suppliers of the increase in installment credit were almost exclusively financial institutions. They showed

[1] The consumer credit statistics published in the monthly *Federal Reserve Bulletin* include short and intermediate credit extended to consumers through regular business channels—commercial banks, other financial institutions, retail stores and service establishments. Although the consumer credit concept logically includes real estate mortgage credit on owner-occupied houses, this kind of credit is usually long-term and traditionally has been excluded from consumer credit. Statistics of this kind of credit are also published in the *Federal Reserve Bulletin*.

an installment-credit expansion of slightly more than $3.8 billion, half of which came from commercial banks. Sales finance companies supplied about $1.2 billion of the increase in such credit, and the remainder was accounted for by credit unions, consumer finance companies, and other financial institutions. Retail outlets as a group showed a very slight expansion of installment credit at the end of the third quarter. Automobile dealers increased such credit about $80 million, and department stores, about $25 million. Furniture and household appliance stores and other retail outlets reduced their installment credit about $80 million.

Of the three components constituting noninstallment credit, charge accounts at stores declined about $0.7 billion during the first three quarters of 1959; single-payment loans, supplied mainly by commercial banks, increased $0.4 billion; and service credit expanded slightly (about $0.1 billion). The latter increased from $2.8 billion at the end of the year to a peak of $3.0 billion in April, and then declined gradually to $2.9 billion at the end of September. Part of this increase probably reflected a growing use of credit cards for such expenses as travel, meals, and hotel accommodations.

COOPERATIVES. United States.—Farm supply cooperatives, while improving their services, are lagging behind city consumer groups in the rate of increase in sales. During 1959, consumer cooperative sales advanced about 12%; farm supply cooperative sales, about 3%. New consumer cooperative stores are being built in Virginia, Maryland, Wisconsin, California, and Pennsylvania.

MAJOR TYPES OF COOPERATIVES IN THE U.S.

Type of Cooperative	Number	Membership (in millions)	Annual business volume
Credit unions	19,000	10.7	$3,100[1]
Cooperatively-oriented mutual insurance companies	10	11.0	375[2]
Cooperative and other group health plans	30	1.4	60
Farm supply rural consumer cooperatives	3,371	3.49	2,100[3]
Rural electric cooperatives	1,000	4.5	563
Rural telephone cooperatives	3,630	0.5	24
Farm marketing cooperatives	6,267	4.12	8,000[3]
Production credit associations	500	0.48	1,900
Consumer stores, fuel cooperatives, etc.	1,050	0.75	180
Cooperative housing associations	200	0.078	40[4]
Student cooperatives	500	0.05	11
Funeral cooperatives	50	0.05	0.6
Retailer-owned wholesales	500	...	...

[1] Loans. [2] Premium income. [3] Figures adjusted to eliminate cooperative-to-cooperative trade. [4] Estimated annual payments by members for housing. (Source: Cooperative League of the USA.)

The biggest problem facing rural cooperatives is that of keeping money within the cooperative framework. To accomplish this end, cooperatives are extending their interests beyond the scope of their original endeavors. For example, a large federation of farm cooperatives, which has begun to process phosphate in southern Idaho, also purchased a substantial interest in a large potash company. Another federation bought a factory in Alliance, Ohio, for the manufacture of fence controllers and poultry equipment. In a third instance of integration among cooperatives, a large regional farm supply group bought a packing plant for the processing and marketing of hogs, a steel grain storage bin factory, and 24 acres of land in Kansas City, Mo., for the campus of a proposed cooperative college. By affiliating with eight small cooperatives, an eastern farm supply cooperative added poultry and egg marketing to its operations. A number of dairy cooperatives are buying processing plants and expanding their consumer services.

In the United States, more than 95% of the farms are supplied with electricity, and, because of increased consumption, electric rates are the lowest in history. A federation of Indiana rural electric cooperatives is seeking a $53 million loan from the Rural Electrification Administration (REA) in order to build a power station and transmission lines supplying 17 cooperatives with 17,500 members. (In this regard, it should be noted that the Eisenhower administration has recommended an increase in interest rates on government REA loans to rural electric cooperatives. Such a move has been opposed by leaders in Congress.)

In 1959 there were two important developments in the cooperative health field. First, labor health plans merged with cooperative health plans to form the Group Health Association of America. Second, the American Medical Association, at its annual meeting, recognized for the first time that cooperative medical groups are, by and large, performing an outstanding service for their 5.5 million members.

Canada.—Canadian cooperatives marked their 50th anniversary in 1959. During 1958–59, marketing cooperatives handled $895 million worth of farm products, 9½% more than in 1956–57. Sales by farm supply cooperatives, numbering over 2,000, with more than 1 million members, increased by 4½%, to $296 million. Farm cooperatives marketed about 33% of all agricultural products. The United Cooperatives of Ontario opened province-wide facilities for processing milk, cheese, butter, eggs, and poultry.

Great Britain.—According to the government Registrar of Friendly Societies, retail cooperative societies in Great Britain numbered 1,000 at the end of 1958. Membership totaled 12,420,000, an increase of almost 300,000 (or 2.2%) since 1957; assets were valued at about £458 million. Retail sales of all societies increased by 2.3% to £974 million in 1958. In the United Kingdom at the end of 1958 there were some 400 agricultural cooperative societies which provide their members (over 310,000) with goods and services or market their products. The yearly turnover of these societies is about £170 million. Nine new cooperative housing societies have registered, bringing the total to 156.

Cooperative League of the USA.

COPPER. Table 1 shows the production of copper (smelter output) in the world and in the United States in thousands of metric tons, according to the U.S. Bureau of Mines.

Table 1—PRODUCTION OF SMELTER COPPER
(In thousands of metric tons)

Year	World	U.S.	% in U.S.	Year	World	U.S.	% in U.S.
1949	2,360	779.8	33.0	1954	2,970	858.1	28.9
1950	2,645	914.9	34.6	1955	3,300	1,003.8	30.4
1951	2,800	940.4	33.6	1956	3,430	1,003.5	29.3
1952	2,820	929.3	33.0	1957	3,510	985.3	28.1
1953	2,970	950.6	32.0	1958	3,566	870.1	27.0

United States.—In 1958 mine production of recoverable copper totaled 927,329 short tons, compared with 1,086,859 tons in 1957. In the first nine months of 1959, mine output totaled 747,180 tons, compared with 698,551 tons in the comparable 1958 period. Smelter output in the 1959 period was 741,263 tons, compared with 702,024 in the corresponding period of 1958. Refinery output was 1,352,500 tons in 1958, against 1,454,200 in 1957. Secondary recovery from old scrap was 411,400 tons in 1958, as against 444,500 tons in 1957.

Table 2 shows the domestic mine production of copper by states, in thousands of short tons.

Apparent consumption of primary copper, which includes deliveries to the national strategic stockpile, decreased 7% in 1958 and was the smallest on record since 1949. Actual consumption of refined copper likewise was the smallest since 1949, based on reports from consumers of quan-

Table 2—MINE PRODUCTION OF COPPER BY STATES
(In thousands of tons)

State	1955	1956	1957	1958
Arizona	454.1	505.9	515.9	485.8
California	0.6	0.9	0.9	0.7
Colorado	4.3	4.2	5.1	4.2

Total	998.6	1,104.2	1,086.9	979.3

[1] In 1958 only 52 tons. (Source: U.S. Bureau of Mines.)

tities entering processing. Producers' stocks of refined and unrefined copper declined 20% in 1958; at the beginning of the year, stocks were the highest since the end of 1945, but they declined by the year's end.

Reports from copper-selling agencies indicate that 1,227,000 tons of domestic refined copper was delivered to purchasers at an average price of 26.3 cents a pound. The average price of foreign copper delivered in the United States was 25.0 cents a pound. Imports of unmanufactured copper were 594,032 tons in 1957 and 496,309 tons in 1958. Imports of refined copper were 162,309 tons in 1957 and 128,464 in 1958.

(See MINERAL PRODUCTION for output of major countries.)

COPYRIGHTS. July 1, 1959, marked the 50th anniversary of the United States copyright law. Although the law has been amended 21 times, there is considerable belief that its provisions have not kept pace with technological advancement in the fields of communication to which copyrights apply. Consequently, with congressional authorization, the U.S. Copyright Office has been engaged for the past few years in studying the principal problems that would be involved in writing a new law. In 1959 some two dozen study papers had been completed, thus clearing the way for an attempt at revision of the present copyright law.

The most controversial copyright question of recent years is the proposed elimination of a statutory provision which exempts juke-box operators from the payment of performance royalties. A bill to effect such a change (H.R. 5921) was introduced by Congressman Emanuel Celler of New York, but no final action was taken.

There is a growing opinion that a need exists for the protection under copyright principles of the ornamental designs of useful objects. A bill with this intent was introduced by Sen. Joseph O'Mahoney of Wyoming. Although Congress did not act on this measure, future hearings were planned.

In regard to the problem of design copyrights, an international committee of copyright experts met at The Hague, Sept. 28–Oct. 10, 1959, to consider a revision of The Hague Arrangement covering the international deposit and registration of designs. The meeting was held in preparation for a diplomatic conference scheduled for 1960 to revise the text of the arrangement, with the aim of producing a simple, effective procedure for the international protection of designs by means of a single international registration. In addition, the fourth annual session of the Intergovernmental Copyright Committee of the Universal Copyright Convention,[1] meeting in Munich, Oct. 12–17, 1959, also considered the problem of the international protection of works of applied art.

During the 1959 fiscal year, registrations (including renewals) by the U.S. Copyright Office were as follows:

Books:	
(a) Printed in the United States:	
Books, pamphlets, leaflets, etc.	103,670
Contributions to newspapers and periodicals	3,042
Total	106,712
(b) Printed abroad in a foreign language	6,262
(c) English books registered for ad interim copyright	822
Total books	113,796
Periodicals (numbers)	124,425
Lectures, sermons, addresses	829
Dramatic or dramatico-musical compositions	3,125
Musical compositions	88,833
Maps	3,728
Works of art, models or designs	7,775
Reproductions of works of art	2,258
Drawings or plastic works of a scientific or technical character	946
Photographs	1,183
Prints, labels, and pictorial illustrations	23,939
Motion-picture photoplays	5,502
Motion pictures not photoplays	1,657
Total	377,997

GEORGE D. CARY,
General Counsel, U.S. Copyright Office.

CORN. See AGRICULTURE; GRAINS.

CORSICA. A Mediterranean island forming a department of France. Area, 3,367 square miles; pop. (1954), 246,995. Ajaccio (32,997) is the capital. Corsicans speak an Italian dialect. Wine, olive oil, timber, and asbestos are exported. On Feb. 19, 1959, Corsica was visited by Moroccan King Mohamed V.

COSMETICS, PERFUME, AND TOILET PREPARATIONS. Cosmetic and toiletry purchases by the American public reached an all-time high of almost $3 billion at retail in 1958. As reported by *Drug Topics* magazine, retail sales by cosmetic and toiletry categories in 1958, as compared with 1957, are shown in the following table:

Category	1958	1957
Oral hygiene items	$ 380,950,000	$ 351,790,000
Hair products	633,350,000	613,710,000
Shaving preparations	414,180,000	410,940,000
Hand preparations	112,350,000	110,240,000
Cosmetic items	445,230,000	420,590,000
Other toiletries*	992,990,000	932,110,000
Total	$2,979,050,000	$2,839,380,000

*Comprising (1958 retail values): fragrances, $120,890,000; paper products, $481,770,000; toilet soaps and deodorants, $324,340,000; and toilet accessories, $64,990,000.

Increases occurred in every major category, with cosmetics showing a $25 million rise over 1957. Fragrances and make-up preparations accounted for most of the rise in cosmetics, as women's purchases of aerosol colognes and more expensive lipsticks showed marked increases. The use of eye make-up products has also grown sharply, with such items as mascara and eye shadow revealing a rapid growth pattern over the past two years. On the other hand, certain cosmetic categories, such as loose face powder, bath salts, cake make-up, and manicuring implements have shown little growth from year to year.

In men's toiletries, sales of electric shavers decreased in 1958, dropping in retail volume from

[1] Following the ratification during 1959 of the Universal Copyright Convention by Lebanon, Czechoslovakia, and Brazil, the number of adherents rose to 34; they were: Andorra, Argentina, Austria, Brazil, Cambodia, Chile, Costa Rica, Cuba, Czechoslovakia, Ecuador, France, German Federal Republic, Great Britain, Haiti, Iceland, India, Ireland, Israel, Italy, Japan, Laos, Lebanon, Liberia, Liechtenstein, Luxembourg, Mexico, Monaco, Pakistan, Philippines, Portugal, Spain, Switzerland, United States, and the Vatican.

$133,140,000 in 1957 to $124,870,000, the lowest point in the past three years. Sales of razor blades and shaving cream, however, reached all-time peaks in 1958.

Sales of oral hygiene products in 1958 showed a $30 million increase over the preceding year, with large-scale gains noted particularly among such items as toilet soaps, tooth paste, and mouthwashes. Home permanents, for the third consecutive year, showed a sharp decline, dropping from over $86 million in 1956 to $74 million in 1958. On the other hand, hair coloring preparations have shown an opposite trend, growing from $28 million in 1956 to $37 million in 1958. Shampoos have continued to increase in retail volume, particularly in the category of medicated hair cleansers designed to combat dandruff.

President, Richard Hudnut–DuBarry Division, Warner-Lambert Corporation.

COSMIC RAYS. See Index entry.

COST OF LIVING. The general level of prices in the United States increased slightly in 1959, as it did in the previous year. In the first three quarters of 1959 the cost of living, as measured by certain retail prices, rose 1.2%. The level of wholesale prices increased only 0.4%. All of the rise in the cost of living occurred after the first quarter. Food prices on the average showed some fluctuations but were at the same level in September 1959 as in December 1958, and were appreciably lower than in September 1958. All other major groups of cost of living items showed price increases during the same period. Only fractional fluctuations occurred in the level of wholesale prices, but its relative stability was the result of offsetting price changes. Prices of farm products and processed foods decreased on the average during the first three quarters, while the average of industrial prices increased. Both consumer and wholesale prices reached an all-time high in 1959.

Demand for practically all consumer items increased appreciably during the first three quarters of the year, a period of continued economic improvement. This was true particularly of durable goods (mainly new passenger cars and major items of household equipment) for which a substantial decline in demand had occurred in the previous year. The sharp rise in consumer spending for durable goods reflected a higher level of personal income and a greater use of credit (see CONSUMER CREDIT) than in the previous year. Although personal income declined slightly in the third quarter because of the steel strike (see IRON AND STEEL; LABOR), total consumer expenditures showed no tendency to decline. The moderate increase in consumer expenditures in the third quarter was the result of increased use of credit and a substantial reduction in the rate of personal savings.

Government expenditures (federal, state, and local), which increased appreciably in 1959, contributed to the maintenance and expansion of demand for many goods and services. This effect was particularly important for materials used in the construction of highways, other state and local improvements, and various kinds of equipment. On the other hand, the federal government's bolstering of demand for farm products was lessened slightly. Basic farm products acquired by the government at relatively high support prices and in part exported at much lower prices failed by a slight percentage to maintain the average price of such products in the first three quarters of the year at the level of 1958.

The substantial increase in business investments (see BUSINESS DATA), particularly expenditures for residential construction, producers' durable equipment, and for inventories, raised appreciably the demand for many industrial raw materials, machinery, and construction products. This source of increased demand showed some tendency to expand at a slower rate in the third quarter of 1959, partly because of the huge increase in inventories of steel products in the previous quarter in anticipation of a steel strike. In general, business investments, which showed a heavy decline in 1958 and accounted in part for some lower industrial prices, were expected to make an important contribution to aggregate demand in 1959.

On the supply side of markets, there was no lack of capacity to make goods and services available. Agricultural output (see AGRICULTURE) nearly reached the all-time high of the previous year. In industry, private investment in plant and equipment, particularly the latter, provided adequate additional capacity for a greatly expanded output. The only shortages which appeared in the second half of the year resulted mainly from the strike in the steel industry.

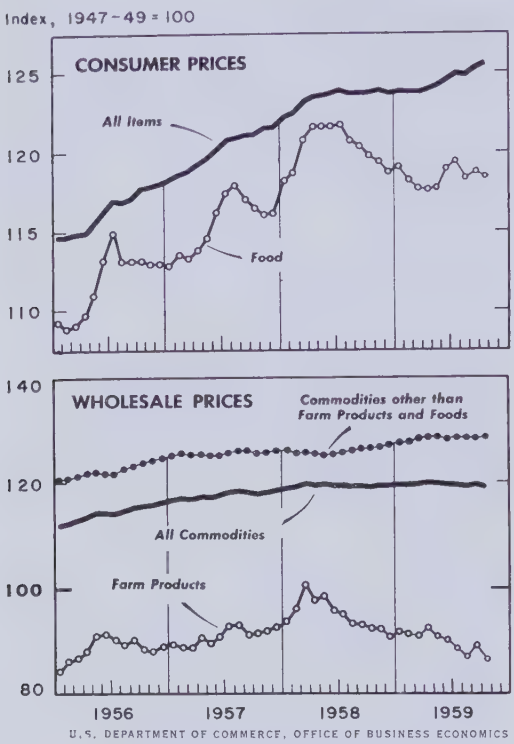
There were in general no labor shortages, with unemployment ranging from 4.7 million workers in the early part of the year to 3.2 million in September. Moreover, the very moderate increases in wage rates during the first three quarters were probably offset in many instances by improvements in production, so that unit costs and supply prices were not affected.

The average level of prices was expected to remain relatively stable in the last quarter of 1959. However, the nature of settlements of the steel strike and of strikes in nonferrous metals industries injected an element of uncertainty into future price trends.

The federal government sought in 1959 to prevent the economy from re-entering another period of creeping inflation such as occurred in 1956–57, when the price level rose about 6%. This policy was indicated by its efforts to balance the budget, to shift some of its borrowing to a longer term basis at higher interest rates, and its approval of the Federal Reserve System's restraint on the expansion of credit (see BANKING). The effectiveness of the policy in maintaining a relatively stable price level, or in confining any increase approximately to 1% or less in 1960 was also difficult to estimate.

Consumer Price Index and Retail Prices.—The Consumer Price Index indicated a slight rise in the cost of living in the United States in 1959.[1] It remained approximately at 123.7, the level of December 1958, until April, when it showed a tendency to rise, and reached an all-time high of 125.2 in Sep-

[1] The index is published by the U.S. Bureau of Labor Statistics. It shows average changes in retail prices of selected goods and services (about 300 items: 87 foods; 78 articles of apparel; 70 housing items, including rent, fuel, and house furnishings; and 61 other items, mainly services) which are important in the purchases of city wage-earner and clerical-worker families. Since these moderate-income families spend more, for example, on food than on apparel, a change in the price of food is of greater importance or weight in the cost of living than an equal change in the price of apparel. Consequently, based on their importance in 1952-expenditures, the 87 foods of the index have about 30% of total weight, and the 78 apparel items about 10% (housing items, 32%, and other items, about 28%). An average price change on foods, therefore, has about three times as much influence in the index as an equal change on apparel items. The moderate-income families, for which the 300 consumer items constitute important expenditures, represent about 64% of all people living in urban areas and about 40% of the total population. Hence, changes in the index do not accurately reflect changes in the cost of living of families at the lowest and highest extremes of the income scale. The average level of prices of the 300 items, weighted as indicated above, for the three years 1947–49 is called the base period and is designated as 100. Averages of prices for other periods can then be related proportionately to the base period of 100.



tember. Lower food prices in February and March offset increases for most other groups of goods and services, and the index remained stable. A slight decline in food prices in April did not offset the higher prices for transportation, medical care, recreation, and personal care, and the index rose to 123.9—the previous record level attained in the second half of 1958. Thereafter, practically all groups of goods and services showed monthly price increases. In August, however, lower food prices more than offset price increases of other items, and the index declined from 124.9 to 124.8. In September the peak index of 125.2 was 25.2% above the base period of 1947–49 and 8.5% above the record (115.4) of October 1953 which preceded the period of relative retail price stability ending in May 1956.

In September 1959 the Consumer Price Index was 1.2% higher than in the previous September. The food component of the index was 1.3% lower. Retail prices of meats, poultry, and fish were substantially lower than a year earlier; cereals, bakery products, and dairy products were slightly higher; and fruits and vegetables were appreciably higher. The housing component of the index, which was 1.4% higher than in the previous September, reflected appreciable increases for rent, gas and electricity, and household operations. Apparel prices were 1.8% higher for the year, largely because of a substantial increase in the prices of footwear. In the same period the remaining components of the index (transportation, medical and personal care, reading and recreation, and miscellaneous items) showed an increase ranging from 2.6% for personal care and reading and recreation, to 3.9% for medical care.

Consumer Price Indexes for Ten Large Cities.—Prices of items included in the cost of living index are collected in 46 cities which are representative of urban areas in the United States. Separate indexes are calculated for each of the 20 largest cities. Figures for ten of these, having indexes available in August, are presented in the accompanying table. Comparison of city indexes shows that prices in one place may have changed more or less than in another. They do not measure differences in the cost of living between cities. Among the ten cities represented in the table, the greatest increase in the cost of living between 1947–49 and August 1959 occurred in Seattle (28.9%); the smallest increase, in Scranton (21.2%). During this period the national Consumer Price Index increased 24.8%. From August 1958 to August 1959, the greatest increase in the cost of living occurred in Seattle (2.1%) and the smallest increase in Detroit (0.0%). During the same period the national Consumer Price Index rose 0.9%.

CONSUMER PRICE INDEX FOR TEN LARGE CITIES
AUGUST 1959 AND 1958 (1947–49 = 100)

City	August 1959	August 1958	Per cent change 1958 to 1959
Chicago	128.3	126.9	1.1
Cleveland	125.8	125.1	0.6
Detroit	123.7	123.7	0.0
Houston	124.8	124.0	0.6
Los Angeles	127.5	125.5	1.6
New York	123.0	121.1	1.6
Philadelphia	124.4	123.4	0.8
Scranton	121.2	120.4	0.7
Seattle	128.9	126.3	2.1
Wash., D.C.	122.0	121.2	0.7

(Source: U.S. Department of Labor, Bureau of Labor Statistics.)

Wholesale Commodity Prices.—The monthly wholesale price index of the U.S. Bureau of Labor Statistics showed a fractional increase of 0.4% in the first three quarters of 1959.[2] It rose from 119.2 in December 1958 to 120 in April 1959—an all-time high exceeding the previous record of 119.7 in March 1958. Later, the index fell to 119.1 in August and then rose to 119.7 in September. Increases in the early part of the year were the result primarily of higher prices of farm products (particularly fresh vegetables) and secondarily of industrial products (particularly hides and leather, and lumber and wood products). Prices of processed foods declined. In the May–September period prices of processed foods increased slightly, those of farm products declined (particularly livestock and live poultry), and those of industrial products remained relatively stable. During the three quarters the combined index for farm products and processed foods decreased about 1.3% and the index of industrial prices increased about 1.0%—partially offsetting changes which resulted in only a fractional increase in the all-commodities index.

The wholesale index of 119.7 in September 1959 represented an increase of 0.5% over September 1958. All of the increase resulted from an average increase of 1.7% in the prices of industrial products. Prices of hides, skins, leather, and leather products; of lumber and wood products; and of tobacco manufactures and bottled beverages were substantially higher. Also, appreciable increases occurred in the prices of textile products, metals and metal products, and machinery and motive products; only fractional increases occurred for chemicals, paper and allied products, furniture, and nonmetallic minerals (structural). The other three commodity groups in the wholesale index of industrial products (fuel, power, and lighting material; rubber products; and miscellaneous products) showed appreciable decreases in average prices.

On the other hand, prices of farm products and processed foods were lower in September 1959 by 4.5% and 3.0%, respectively, than a year earlier. Substantially lower prices prevailed for livestock and live poultry, plant and animal fibers, and eggs. The latter reached the lowest price since 1941. Only wholesale prices of fresh vegetables and fruits were appreciably higher. Wholesale prices of the majority of processed foods were appreciably lower (for example, meats, poultry, and fish; canned and frozen fruits and vegetables; packaged beverage materials; and fats and oils). Only prices of cereal, bakery products, and dairy products were slightly higher.

[2] It includes prices of nearly 2,000 basic commodities: that is, prices charged by manufacturers or producers, or prices prevailing on organized commodity exchanges. The monthly index is calculated from prices collected for a single day of the month, usually the Tuesday of the week containing the 15th. Since the different commodities priced are of different importance in relation to total trade, each price is multiplied by a weight determined by its sales in 1954. The average of prices for 1947 through 1949 is used as the base period (100). Since many of these prices are for raw materials, changes in such prices often indicate the future movements of some retail prices and of the cost of living. A few consumer prices, however, particularly rents and charges for many services, have no direct counterpart among wholesale prices.

Canada.—The cost of living in Canada continued to rise moderately in 1959. During the first three quarters the index of consumer prices rose 0.7%, and in September it was 1.2% higher than a year earlier. In these two periods prices of shelter, household operations, and other commodities and services showed a moderate increase. Food prices, however, increased only fractionally in the first three quarters and in September were slightly lower than in the previous September. Prices of clothing, the remaining component of the index, decreased slightly in 1959, but were fractionally higher in September than a year earlier.

The level of wholesale prices showed an increase almost identical with that of the consumer price index. In the first three quarters of 1959 the wholesale index rose 0.7%, and in September was 1.1% higher than a year earlier. Prices of animal products (particularly hides and skins, and leather) increased substantially. In this commodity group only prices of eggs and cured meats decreased. Prices of lumber also increased substantially. Slight increases occurred in the average prices of iron and steel products, nonferrous metals, and chemicals. Prices of vegetables, grain products, fibers, and textiles remained relatively stable. Of the eight commodity groups included in the index, only prices of nonmetallic minerals decreased slightly, particularly prices of petroleum products and asphalt.

United Kingdom.—The price level was highly stable in the United Kingdom in 1959. In the first three quarters of the year the cost of living declined fractionally, but in September was fractionally above the level of the previous September. This trend also appeared in food prices. A substantial decrease occurred in the price of beverages. Prices of fuel and light declined appreciably in 1959, but in September were at about the same level as a year earlier. A slight decrease occurred in the average price of household durable goods. Prices of clothing and tobacco remained practically unchanged. The price of housing, the remaining component of the index, showed a slight increase.

The wholesale price level showed very little change for the 9 or 12 months ending September 1959. Prices of materials used in manufacturing industries increased slightly, but there was a fractional decrease in the price of materials used in building and civil engineering and in house building. The price of raw cotton declined slightly, but prices of other basic commodities, such as raw wool and rubber, increased appreciably. Prices of the products of manufacturing industries decreased slightly. This was particularly true of iron and steel products.

CLIFFORD L. JAMES,
Professor of Economics,
The Ohio State University.

COSTA RICA. This compact Central American country (area, 19,965 square miles) is bounded by Nicaragua on the north and Panama on the southeast. Except for approximately 22,000 Negro plantation workers on the Caribbean coast and some 1,200 Indians, nearly all of Costa Rica's 1,072,000 inhabitants (1958 est.) are of Spanish descent. The central plateau, with its "eternal spring" climate, is set among volcanic peaks ranging over 11,000 feet. Principal cities (with 1957 est. populations) are San José, the capital (133,734); Cartago (23,498); Limón (20,764); and Puntarenas (20,108).

Government.—The constitution of 1949 established a unicameral Legislative Assembly (45 members elected for 4-year terms), a popularly elected president (Mario Echandi Jiménez, inaugurated May 8, 1958, for a 4-year term) who may not succeed himself, and a Supreme Court (17 justices chosen by the assembly for 8-year terms). Following the elections of Feb. 2, 1958, President Echandi's National Union Party held only 10 seats in the assembly; ex-President José Figueres' National Liberation Party had 20; the National Republicans, 11; Civic Union, 1; and independents, 3. Suffrage is extended to men and women at the age of 20, and there are no literacy restrictions.

Education and Religion.—Primary instruction is free and compulsory; 167,846 pupils were enrolled in primary schools in 1957. Secondary education has been free since 1949; there were 20,514 secondary students in 1957. The University of Costa Rica in San José (2,458 students) is setting up the country's first medical school in cooperation with Louisiana State and Tulane Universities; premedical training was to begin in 1959.

Most Costa Ricans profess Roman Catholicism, the state religion (the government contributes to church budgets and controls church patronage), but the strong democratic traditions and the constitution allow individual freedom of worship.

Finance.—The colón remained stable in 1959 at 5.60 to the U.S. dollar for most exports and 5.67 for essential imports (6.65 for other imports). The country's gold and foreign exchange reserves (chiefly U.S. dollars) rose substantially to $24.6 million by July 1959 (end of 1957, $11.75 million; end of 1958, $19.52 million). The cost-of-living index (1953 = 100) declined during 1959 to 112 in July, from 114 in January. The government budget showed a deficit of 77 million colones for 1956, but a surplus of 6 million for 1957.

PLETCHER IN THE SIOUX CITY JOURNAL

"KEEPING UP WITH THE JONESES"

Transportation and Communications.—Reassessment of the cost of completing the missing link of the Inter-American Highway in the mountainous jungle terrain of southern Costa Rica led to a $5 million loan by the Export-Import Bank of Washington in 1959 to finance Costa Rica's share; the United States defrays two thirds of the cost directly, and the U.S. Bureau of Public Works supervises construction. In 1959, Costa Rica ceased its "flag of convenience" practice of registering alien ships; 233 foreign-owned vessels were affected. In 1959, after 60 years of operation, the United Fruit Company discontinued, for lack of business, its freighter service to the east coast (Puerto Limón). San José is connected by rail with Limón and with Puntarenas on the Pacific; a number of short-run railways are also in operation. Principal highway mileage is approximately 350; 22,103 motor vehicles were registered at the end of 1957. San José's modern El Coco airport is served by several international airlines; the national carrier, Líneas Aéreas Costarricenses, provides daily flights from El Coco to the major towns and cities.

Production.—Coffee and bananas are the main cash crops. Production of coffee for export in 1958–59 was estimated at 760,000 bags, or double the 1950–54 annual average and 11% above 1957–58. By international agreement, 20% of this crop is to be retained. Banana shipments declined in 1959 from about 9 million stems in 1958 because of storm damage. Cacao production has been stimulated by favorable market and price conditions; 9,000 metric tons (up 17% over 1957–58) were estimated for 1958–59. To meet the needs of a new slaughterhouse, 40,000 Nicaraguan cattle had to be imported to fulfill 1959 meatpacking requirements. Increased acreage and improved techniques resulted in an exportable surplus of cotton for the first time in 1958–59.

Per capita agricultural output in 1956–57 was 37% above the 1935–39 annual average. As a consequence of modernization (new and improved equipment, fertilizers, weed killers, insecticides,

etc.), productivity has improved markedly in rice, beans, corn, and meat, and the coffee yield is now some 500 pounds per acre (1949–54 annual average, 365 pounds). The continuing weakness of coffee prices caused the government to expand its diversification projects in light industry and agriculture, with the assistance of a World Bank loan (Feb. 11, 1959) of $3.5 million. Dependence on coffee as a foreign exchange earner has been growing sharply in recent years; coffee accounted for 55% of total exports in 1958, compared with 30% in 1948.

The gross national product was 2,287 million colones in 1957 (2,122 million in 1956). Business in general in 1958 prospered, but in recent years precipitation on the central plateau (rainy season, May to December) has been subnormal, with the result that a major water and power shortage has developed.

Foreign Trade.—Exports in 1958 continued to expand and totaled $91,900,000 (1957, $83,030,000). Coffee exports accounted for $50,560,000 (1957, $40,620,000), as the greater volume more than made up for the drop in price; bananas, $26,450,000 (1957, $32,200,000); and cacao, $5,850,000 (1957, $3,990,000). Other exports include lumber, abacá, live cattle, seafood, and insecticides. Beef should soon replace cacao as the nation's third export; in 1957–58, 17,000 head were shipped (1956–57, 3,700 head). Imports in 1958 were valued at $99,320,000 ($102,780,000 in 1957), and consisted chiefly of manufactures and foodstuffs. Exports to West Germany (mainly, coffee) have soared from 1.7% of the total in 1952 to 24.1% in 1957, and imports from West Germany have increased from 5.2% of total imports in 1952 to 9.2% in 1957. Exports to the United States declined in the 1952–57 period from 71.6% of the total to 55.2%; imports from the United States also declined, from 62.9% in 1952 to 55.2% in 1957.

Principal Events, 1959.—President Echandi found it difficult to retain his unpopular policy of neutrality toward political conflicts in the Caribbean area and Central America. The Legislative Assembly approved a resolution in January condemning the dictatorial nature of governments in Nicaragua, Paraguay, and the Dominican Republic; and on March 10 the assembly censured the president for being cordial (during a border ceremony in February) to President Luis Somoza of Nicaragua.

Ex-President José Figueres' falling out with Fidel Castro, after he had pronounced the Cuban executions justified and Castro a great leader, was the most disconcerting development for Costa Ricans. As a guest of the Cuban government in March, Figueres spoke frankly about the Latin tendency to abuse the United States and to underestimate the danger of world war. He was rudely interrupted by David Salvador, Cuban labor leader, who shouted that there could be no friendship between the United States and "oppressed" Cuba. This incident initiated an estrangement and verbal battle between the moderate left-wing, democratic forces in the Caribbean (exemplified by Figueres) and the radical ultranationalist elements of the region (led by the Cuban revolutionaries). Figueres, in Costa Rica, opined that acceptance of Communist support would end in a "dictatorship of the mob." Manuel Mora, Costa Rican Communist leader, returning from a visit to Cuba, denounced Figueres as "a servant of Yankee imperialism."

Revolutionary operations against the Somoza regime in Nicaragua continued to be based in part on Costa Rican soil despite the efforts of the incumbent administration. In June the assembly voted a resolution of support for the rebels. University students also declared their "moral and material" support of the rebels' "noble cause." Two Costa Rican congressmen, Marcial Aguiluz and Frank Marshall, were leaders in the anti-Nicaraguan activities.

ROBERT D. HAYTON,
Assistant Professor of Political Science, Hunter College.

COTTON. Increased acreage boosted the 1959 cotton crop of the United States 3.2 million bales above production in 1958. The crop, estimated by the Agricultural Marketing Service of the U.S. Department of Agriculture at 14,701,000 bales (500 pounds gross weight each), also was above the 1948–57 average of 14,046,000 bales. The 1959 crop included 72,800 bales of American-Egyptian cotton, 10,800 less than was produced in 1958. Yields in 1959 fell just one pound short of the 1958 record of 466 pounds per acre. (Yields have moved sharply upward during most of the postwar period; the 1947–49 average was 287 pounds.)

Farmers planted 15,803,000 acres in 1959, compared with 12,379,000 in 1958. Abandoned land, including acreage removed for compliance with acreage allotments, was estimated at 4% of the planted acreage. In 1959, 15,164,000 acres were harvested, compared with 11,849,000 in 1958. Most of the increase in acreage over 1958 resulted from the termination of the acreage reserve program of the soil bank, in which nearly 5 million acres of cotton allotment land had been placed in the preceding year. Increased acreage also resulted from a new provision of agricultural legislation, which permitted cotton farmers to plant up to 40% more than their acreage allotment, though in doing so they received a lower price support than did farmers who planted within their allotments.

Stocks of cotton on Aug. 1, 1959, the beginning of the 1959–60 marketing year, amounted to 8,899,700 running bales, 163,000 more than a year earlier, but well below the 1956 peak of 14,528,800 bales. The total supply of cotton for 1959–60, including the carry-over, the 1959 crop, and an allowance for imports, was estimated at 23,729,700 running bales. This was above the 1958–59 total of 20,146,500 bales, but considerably short of the record supply of 27,643,900 for the 1956–57 marketing year.

Production of cotton outside the United States in 1959–60 declined for the first time in the postwar period. The Foreign Agricultural Service estimated production at 31,918,000 bales, 785,000 less than in 1958–59, but 7,651,000 above the

WAYNE DEXTER,
Agricultural Marketing Service,
U.S. Department of Agriculture.

COUNCIL OF EUROPE. This 15-nation deliberative and consultative body completed in 1959 the first decade of its existence, the founding statute having been signed in London on May 5, 1949. (For membership of the Council of Europe, see EUROPEAN ORGANIZATIONS.)

The oldest and most broadly-based of the many European organizations, the Council of Europe may be said to have two general functions. First, it constitutes an open European forum in which viewpoints are explained and defended. Secondly, it maintains a constant and informed watch on the activities of the purely "functional" organizations, and in so doing promotes technical cooperation in specific fields. The council continued throughout 1959 to fulfill (within the basic limitations on its powers) this dual role.

The council's Consultative Assembly (its quasi-parliamentary body) met three times at Strasbourg in 1959. The third part of the Tenth Ordinary Session was held on January 19–22; there was also a special ceremonial sitting of the Assembly on April 20 to mark the council's tenth anniversary. The first part of the Eleventh Ordinary Session met on April 21–27, and the second part on September 14–18. The Committee of Ministers (the foreign ministers of the member countries) met on April 20 and December 14–15.

The highlight of the year was the inauguration of the European Court of Human Rights, based on the European Convention for the Protection of Fundamental Rights and Human Freedoms, whose ratification was completed in 1958. The court has 15 judges, but they will act in an individual capacity, and not as national representatives. On Jan. 21, 1959, the court was elected from a list of 43 candidates presented to the Assembly by the Committee of Ministers. The court held its first meeting on February 23–28. It set up a working party to draw up draft rules of procedure. The work was completed in September when Lord McNair (United Kingdom) was elected president of the court and René Cassin (France), vice president.

At the end of the January session of the Assembly, Senator Fernand Dehousse (Belgium) announced he would not seek re-election as president. At the opening of the April session, John Edwards, British Labour M.P., was elected president, thus becoming the Assembly's fifth president and the first from England. He died suddenly on Nov. 23, 1959, at Strasbourg, France.

Two themes were prominent in the Assembly's debates during the year. One was the danger of an economic division of Europe; the other was the need for the rationalization of European institutions. On the first point, the topic was given urgency by the first tariff reductions within the six-power European Economic Community (q.v.). In both April and September the Assembly called for a multilateral European trade organization. On the second point, it was suggested that the social and cultural activities of the Western European Union (q.v.) should be transferred to the council.

Among other proceedings of interest were resolutions strongly affirming the need to maintain the freedom of West Berlin (January 19 and April 23). In the legal field, the council made considerable progress toward the simplification of frontier formalities in Europe.

COUNTERFEITING. See SECRET SERVICE, U.S.
COURTS OF LAW. See LAW.

COUVE DE MURVILLE, Maurice, French minister of foreign affairs: b. Reims, France, Jan. 24, 1907. Appointed minister of foreign affairs in Premier de Gaulle's cabinet in June 1958, he continued in that post when Michel Debré became the first premier of the Fifth Republic on Jan. 8, 1959.

A career diplomat, he came to the Quai d'Orsay by way of the Ministry of Finance. An "inspector of finance" at 23, after graduating first in his class from the École des Sciences Politiques, he remained in the Ministry of Finance until he was dismissed from the Vichy government in 1943. He fled to North Africa where he served in a variety of advisory capacities, first with General Giraud and then with General de Gaulle. He entered the Ministry of Foreign Affairs with the establishment of the Fourth Republic, and thereafter held the posts of director general of political affairs (1945–50), ambassador to Egypt (1950), France's permanent representative to NATO (1954), and ambassador to the United States (1955–56) and to West Germany until entering de Gaulle's cabinet.

Although authoritative statements on French foreign policy generally came from President de Gaulle during 1959, it was Foreign Minister Couve de Murville who in March defended France's abrogation of part of her naval agreement with NATO, who announced in October France's willingness to negotiate a cease-fire with the Algerian National Liberation Front (FLN), and who sought Britain's approval in November of France's intention of strengthening the political and economic bonds between the major continental and Benelux countries. CRETE. A mountainous Mediterranean island southeast of Greece, forming (with adjacent islands) a Greek prefecture. Area (of prefecture), 3,235 square miles; pop. (1951), 462,124. Canea (33,211) is the capital, and the port of Candia (51,144) is the chief city. Farming, sheep and goat raising, and light manufacturing are the chief occupations. Exports include citrus fruit, wine, olive oil, cheese, and almonds.

CRIME. Highlights of the year in crime incidence, and in juvenile delinquency and crime prevention, are reviewed below in two sections: (1) U.S. Crime Statistics; and (2) Delinquency and Crime Prevention. For additional information, see CHILD WELFARE; FEDERAL BUREAU OF INVESTIGATION; LAW; NARCOTICS; POLICE; PRISONS.

U.S. Crime Statistics

Figures compiled by the Federal Bureau of Investigation for 1958 (under its new Crime Index) indicate that crime in the United States is again on the increase. The estimated number of serious offenses committed during 1958 was 1,553,922, an increase of 131,637, or 9.3%, over 1957. From 1957 to 1958 the estimated population in the United States increased 1.7%; therefore the percentage increase in the Crime Index was five times as great as the growth in population.

Crime Trends.—In determining the volume of crime as measured by the new Crime Index, it should be noted that the offenses of negligent manslaughter, minor larcenies, and statutory rape are no longer considered. The overall increase of 9.3% in crime is, however, supported by increases in each of the seven crime classifications which form the basis for the Crime Index.

Forcible rape, which increased 13.0%, was followed closely by robbery and burglary, which were up 12.7%, and 12.6%, respectively. Larceny over $50 rose 10.3%. The remaining Crime Index offenses showed lesser increases as follows: aggravated assault, up 2.6%; auto theft, 2.2%; and murder, 1.9%.

Although crimes of all types occur throughout the year, certain rather definite seasonal patterns emerge when crime data are arranged by months. Aggravated assaults and forcible rapes, for example, occurred at the greatest rate during the warmer months of 1958. On the other hand, negligent manslaughters tended to rise during the last quarter of the year, and robberies and burglaries were also more prevalent during the darker and colder months.

Each day during 1958, an estimated 22 people were feloniously slain, 40 forcible rapes occurred, and 311 other felonious assaults were committed; 1,073 larcenies over $50 were committed; 742 cars were stolen; and 206 robberies and 1,862 burglaries were perpetrated. A further breakdown of these figures indicates that three Crime Index offenses occurred every minute; 177 such serious offenses were committed each hour; and 4,257 occurred each day.

Persons Arrested.—The following data concerning the age, sex, and race of persons arrested are from annual reports prepared by city police. The figures include persons arrested and later released, as well as those held for prosecution under a formal charge, and are for arrests during the year 1958 in 1,586 cities, covering a total population of 52,329,497.

Sex.—Over eight times as many men as women were arrested in 1958, about the same proportion as in previous years. Of the 2,340,004 persons arrested in 1,586 cities during 1958, 248,439 were females and 2,091,565 were males.

Age.—Of the 2,340,004 persons arrested in 1,586 reporting cities during 1958, 284,215 (or 12.1%) were under the age of 18. Of those persons under 18 arrested in 1958, 37.6% (or 106,892) were not yet 15 years of age. Juveniles (under 18) represented 64.1% of all persons arrested for auto theft and 49.9% of those arrested for burglary. Similarly, 48.5% of the arrests for larceny and 22.8% of the arrests for robbery were of young persons who had not reached their 18th birthday.

Of the 2,340,004 persons arrested in 1958, 685,654 (or 29.3%) were under 25 years of age. Of the remaining arrests, 260,117 involved persons who were 25 to 29 years of age. The age group 30 to 34 accounted for 279,461 of the arrests; the age group 35 to 39, for 275,803; the age group 40 to 44, for 239,538; and the age group 45 to 49, for 211,998. Persons who were 50 or older accounted for 387,049 arrests, and the age of persons involved in 384 arrests was not known.

Race.—Of the total 2,340,004 arrests in 1,586 reporting cities, 97.4% were members of the white and Negro races. Arrests of members of the white race totaled 1,583,070 (67.7%) of all arrests in the reporting cities, while 696,209 (29.8%) were of members of the Negro race. The remaining arrests, totaling 60,725, were made up of 43,126 Indians, 1,252 Chinese, 296 Japanese, and 16,051 others.

Offenses Cleared by Arrest[1].—During 1958, police continued the relatively high clearances of crimes by arrest. In an average group of 100 crimes against the person, the police made 69 arrests and through these arrests solved 79 crimes in 1958. For each 100 crimes of all types as a group, the arrest of 21 persons cleared up 26 offenses on the average.

J. EDGAR HOOVER,
Director, Federal Bureau of Investigation.

Delinquency and Crime Prevention

Delinquency Areas.—Some insight into the nature of the juvenile delinquency problem is provided by a look at the sociological conditions in a specific neighborhood near the center of a Midwest metropolis.

This community, less than a square mile in size, had a population of approximately 20,000 in 1950; by 1958 the population had doubled. The increase in population, however, was not accompanied by a comparable increase in housing facilities. Residential property was subdivided and left without repair. In addition, there was an almost complete change in the type of resident families. The former home-owning and apartment-owning residents moved out in the face of an overwhelming influx of migrant workers, who were attracted by the prospects (often vague) of industrial employment. Housing is now so inadequate that even the newcomers move out as soon as their income permits; indeed, the neighborhood has a nearly complete population turnover every two years.

Families newly arriving in this community from rural areas and smaller cities do not bring with them the formal social organizations, such as religious or national solidarity, which characterized previous immigrations. The temporary nature of their moves makes these people singularly uninterested in trying to develop community spirit, which is important to the welfare of families in a new environment. There is, seemingly, no one to care what happens to youthful newcomers, no one to challenge the viciousness of the older youths who dominate the streets by ganging together.

In the process of investigating reported crimes,

[1] The term "cleared by arrest" is used in those instances in which one or more of the offenders responsible for the commision of a particular offense were arrested and subsequently made available for prosecution.

the police of this community have identified 40 street corner groups which engage in delinquent acts. Many youths find themselves coerced into lining up with one gang or another for their own safety. These gangs are indeed a new terrorizing development on the American scene; and depreciated areas of large cities, formerly described as slums, now often may be better characterized as gangland jungles.

While large cities account for the big statistics on crime increase, other locations, formerly presumed to be practically immune to youth crimes, are also faced with spreading delinquency. Metropolitan suburbs, with their above-average standard of living and their high proportion of business executives whose promotion depends on a willingness to move their families from one city to another at frequent intervals, are also faced with increasing youth problems.

Delinquency Statistics.—There is a tendency to interpret year-to-year fluctuations in the number of delinquent youth commitments to correctional agencies as indicating a trend in regard to an increase or decrease in delinquency. Such short-range figures are misleading. Commitment data, therefore, must be based on the average of a period of several years if they are to be reliable as indicators of significant trends.

The Illinois Youth Commission, in an attempt to provide a valid yardstick by which to measure delinquency trends, annually issues a report which shows commitment averages over a five-year period, computed for the current and preceding four years. The following table shows the actual number of commitments to the Illinois Youth Commission in each fiscal year from 1955 to 1959, and the 5-year average commitment rate per 1,000 population in the 10–17 age group:

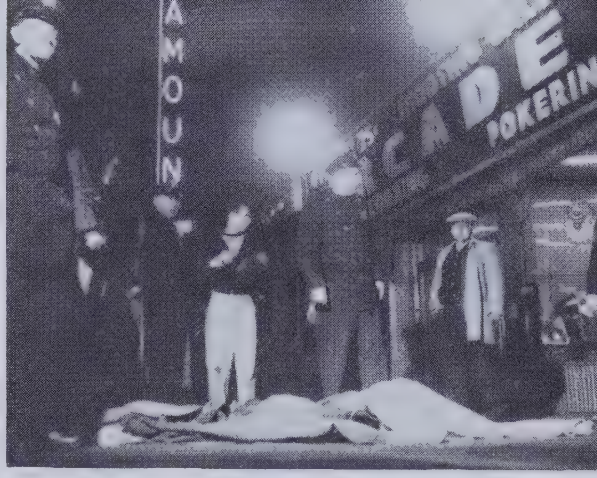
Commitments		Commitment Rate	
Fiscal year (ending June 30)	No. of commitments	5-year period	Rate per 1,000 pop. (ages 10–17)*
1955	1,157	1951–55	4.94
1956	1,318	1952–56	5.67
1957	1,555	1953–57	6.52
1958	1,944	1954–58	7.75
1959	1,881	1955–59	8.63

*Rate for each period based on 1950 census population, uncorrected for subsequent population growth.

The number of commitments to state facilities indicates an increasing tendency for counties to call on state services for help with delinquency problems. Also, the upward trend in the commitment rate reflects the fact that the courts, finding that more and more delinquent youth come from neighborhoods where rehabilitation under probation or other forms of supervision is highly improbable, are turning over an increasing number of delinquents to the Youth Commission.

New York Antidelinquency Drive.—The alarming increase in juvenile delinquency in New York City (q.v.) resulted in a set of proposals by Gov. Nelson Rockefeller to meet the youth crime problem. The governor's program, announced on Sept. 8, 1959, contained the following items: (1) the establishment of work camps for potential delinquents and for the rehabilitation of youths convicted of minor crimes[1]; (2) the acceleration of additional detention facilities to avoid overcrowding; (3) the augmentation of probation and parole services; (4) the review of youth and work laws; (5) the overhaul of the continuation school program; and (6) cooperation with management and trade unions in regard to part-time employment for youth, and a more effective apprenticeship training program.

[1] The federal government, as well as the states, is recognizing the potential value of work camps as a deterrent to juvenile delinquency. (Already, 11 states have launched forest work camps for delinquents.) A bill pending in Congress provides for a system of camps (probably to be known as the Youth Conservation Corps) which aims at preventing possible delinquency among youths "of good character." Two other bills, also due for consideration in 1960, provide for federal-state work camps for youths who have committed delinquent acts.



UPI

Police stand beside the covered body of a teen-ager killed in a gang fight in downtown Brooklyn on Feb. 23, 1959.

Senate Investigation.—The Senate Subcommittee to Investigate Juvenile Delinquency continued its work in 1959. During the year, the committee held hearings in New York City and Chicago regarding the effectiveness of the juvenile court system. The problems given major attention included: (1) the increase in the number of juvenile cases, which in some instances may overload court facilities to a point where services become ineffectual, or break down entirely; (2) the proper selection of cases referred to juvenile courts; and (3) the preservation of offenders' constitutional rights.[2]

Surveys and Reports.—The National Education Association (NEA) conducted a survey project in 1958–59 on juvenile delinquency. This study, completed in June, was undertaken because of the "concern of the teaching profession with the spiralling problem of juvenile delinquency." Specifically, its aim was to seek ways by which teachers and school administrators might help predelinquent and delinquent youth.

The report of the NEA study has been published in two booklets. The first, *Delinquent Behavior: Culture and the Individual* by Dr. William C. Kvaraceus, offers a working philosophy for dealing with the problem of delinquent

[2] The committee's report, *The Effectiveness of the Juvenile Court System,* has been published in an 87-page booklet by the Government Printing Office. A briefer description of these findings appeared in an article by Sen. Thomas C. Hennings, Jr., subcommittee chairman, in the June 1959 issue of *Federal Probation.* The reader is also referred to the article, "The Dilemma of the Juvenile Court," in the March 1959 issue of *Social Service Review.*

Manual labor is prescribed for juvenile offenders held at the Youth Rehabilitation Facility, North Pharsalia, N.Y.

THE NEW YORK TIMES

behavior. Also, for planning and evaluating school practices designed to deal with behavior problems, the booklet provides a knowledge of their underlying causes. This document, the work of a team which drew on current developments in anthropology, sociology, criminology, psychology, psychiatry, and pediatrics, aims at presenting a theory which is consistent with the various aspects of the problem of delinquency and yet does not contain the conflicts that so often are found among the various sciences involved. As indicated by the title, the document points toward environment as the cause of the development of many personality traits and as the area where control of much behavior can be achieved.

The second NEA publication, *Delinquent Behavior: Principles and Practices*, also by Dr. Kvaraceus, deals with desirable school practices for the prevention and control of delinquency. It covers the principal areas in which the school should deal with young offenders—early identification of potential delinquents, school curriculum, pupil-teacher relationships, adjustment services, and school cooperation with community agencies—and gives specific examples of each.

Another significant contribution to the literature on delinquency prevention is contained in the March 1959 *Annals of the American Academy of Political and Social Science*. This issue, "Prevention of Juvenile Delinquency," is devoted to a series of reports describing various prevention projects conducted by social agencies in major cities. An attempt is made in each report to evaluate the effectiveness of the methods used in these scientifically designed programs, which have been set up to test or demonstrate certain innovations or points of emphasis, such as intensive casework services for offenders, coordination of police and social work services, organization of area projects, city block improvement committees, and the use of work camps. (See also SOCIOLOGY.)

White House Conference, 1960.—About 7,000 selected delegates are scheduled to attend the 1960 White House Conference on Children and Youth, Washington, D.C., March 27–April 2. The organization and management of the conference is an assigned function of the U.S. Children's Bureau. In every state during 1959, volunteer committees of professionals and interested lay workers have been surveying youth needs in preparation for the meeting. The major emphasis will be on social changes of the past ten years and the effect these changes have on the social values of today's youth. (See also CHILD WELFARE.)

CROSS-COUNTRY. See SPORTS, GAMES, AND SHOWS.

CUBA. With an area of 44,218 square miles and a population (1953 census) of 5,829,029 (1959 est., 6,666,000), Cuba is strategically and commercially the most important of the West Indian republics. The beautiful capital, Havana, has a population (est. 1959) of 1,249,000. Other large cities, with urban-area populations (est. 1959) are: Santiago de Cuba, 190,000; Camagüey, 128,000; Santa Clara, 91,000; Guantánamo, 77,000; Matanzas, 71,000; and Holguín, 70,000.

Government.—Dr. Fidel Castro and the 26th of July Movement seized power by force after Gen. Fulgencio Batista y Zaldivar resigned as president on Jan. 1, 1959, and fled the country, first to Ciudad Trujillo, Dominican Republic, and later to Lisbon, Portugal. (Batista established his residence at Madeira in September.) Castro proclaimed Dr. Manuel Urrutia provisional president on January 2, and Dr. José Miró Cardona was appointed premier. On January 6 the president dissolved Congress, abolished the Urgency Court (which had tried Castro rebels), and dismissed all governors, mayors, and councilmen. The revolutionary government also announced on January 6 that it would rule by decree for at least 18 months. Later, Castro declared that democratic elections and the re-establishment of constitutional government would not take place for 4 or 5 years. Castro assumed office as premier on February 16 after a new law was decreed on February 10 which reduced the required age for the presidency from 35 to 30 years in order to permit the 32-year-old Castro to take office. Castro resigned as premier on July 17 in order to be free to attack President Urrutia and force his resignation, but he resumed the premiership on July 26 after the Council of Ministers had appointed Dr. Osvaldo Dorticós Torrado as the new president.

Education and Religion.—Cuba's record in providing public primary and secondary education is among the most distinguished in Latin America. The budget of the Education Ministry for 1958–59 was 74,500,000 pesos, the largest amount for any governmental function. Education is compulsory and free between the ages of 7 and 14, and only about 22% of the population above 15 years of age is illiterate. The average length of primary school enrollment is 4–5 years. The Federation of University Students seized control of the University of Havana on Feb. 4, 1959, and announced the dismissal of all professors who had supported former dictator Batista. They also presented demands for various internal reforms. So many professors resigned during the year that the university had difficulty in maintaining operations.

Although most Cubans are nominally Catholics, the Roman Catholic Church has less social and political influence in Cuba than in most Latin American countries.

Transportation and Communications.—Cuba has about 3,714 miles of public service railways. In addition, there are 7,542 miles of private industrial lines, operated primarily by the large sugar estates. The country has 5,083 miles of all-weather roads, including a major highway extending for a total of 706 miles through the country's 6 provinces, from the cities of Pinar del Río to Santiago de Cuba. Damage to railroads, roads, and telephone lines produced by rebel military operations in 1958 was only partially restored in 1959. Cuba is served by some 30 shipping lines, with the port of Havana handling 65.5% of the traffic. There is also excellent international and domestic air service. Cuba has more television sets than any other Latin American country. There are 6 television channels and 80 radio stations. About 1,042,000 homes have radios and 364,560 have TV sets.

Economic Conditions.—On April 23, 1959, Dr. Rufo López-Fresquet, minister of the treasury, predicted that 1959 would be the most prosperous year in Cuba's history. He declared that on January 7 Cuba had gold and dollar reserves of $373,000,000, with an indebtedness of only $262,000,000, leaving a net of $110,000,000. The minister predicted that with expected collections of $100,000,000 in back taxes and with the benefits of the progressive economic plans of the new government, Cuba would prosper greatly. However, the national income was 2,140,000,000 pesos in 1958, as compared with 2,320,500,000 pesos in 1957—a decline of 7.7%. The gross national product was valued at 2,635,400,000 pesos in 1958, down by 200,100,000 pesos from 1957, or a decline of 7.1%. Real per capita income was $335 in 1958, compared with $368 in 1957.

The policies of the Castro government did not arrest the declines that began in 1958. By Feb. 27, 1959, the government had sealed safety deposit boxes, frozen bank accounts, and imposed currency controls. This had the effect of paralyzing construction. The value of private construction permits issued during July 1959, for example, was only two fifths of those issued during July 1958. Rents were reduced 30–50% in March, which had the effect of curtailing construction of new rental units. A new law was decreed on March 1 which permitted the government to confiscate all properties of Cubans who had collaborated with the Batista government at any time since 1952, and on May 13 the government confiscated the holdings of 117 companies and 18 individuals. Most of these companies were engaged in the construction of public works, but some were engineering firms and investment companies, and others included two hotels and two airlines. The government took over about 100 more concerns for investigation of graft chargès.

On March 4 the government seized control of the Cuban Telephone Company, an affiliate of the International Telephone and Telegraph Company, and decreed a reduction in its rates beginning April 1. On August 20, the government ordered the Cuban Electric Company, an affiliate of the American and Foreign Power Company, to cut rates by 30.5%. Although the government also ordered the company to continue its expansion program, the American and Foreign Power Company canceled $15,000,000 in public financing on August 26.

United States direct investments in Cuba almost ceased during 1959. Unemployment became acute by the end of the year. The government attempted to counteract the economic distress by a

program of public works, including expenditures of $134,000,000 in the second half of the year for new roads and streets, sewage systems, aqueducts, bridges, and similar public works. The government also proposed to spend $10,000,000 in each of the 6 provinces for low-cost public housing. However, increased government spending exerted further pressure on foreign exchange balances through increased demand for imported goods. Desperately short of dollars, the government imposed (on September 24) an ad valorem tax of 30–100% on hundreds of imports and drastically tightened restrictions on foreign exchange. It was hoped that this expedient might save $175,000,000 in dollars and foreign exchange.

Tense labor-management relations and government-decreed wage increases (18–20% for the lowest paid workers, 5–10% in the higher brackets) impeded economic development in other fields. Mining operations, for example, were slow during the year. The government intervened and took over operations of the largest manganese mine. A new petroleum law approved on November 21 reduced the size of petroleum claims to 20,000 acres for each individual or company, and imposed a government royalty of 60% on oil production. Another tax reform law, dated July 14 and made effective October 1, reduced the number of tax classifications from about 150 to about 25. Although designed to yield more revenue, some of the provisions of the new law are especially severe on foreign companies.

Agriculture.—At least 500,000 Cubans depend on the sugar industry for their livelihood, and about two thirds of the national income comes directly or indirectly from sugar. Investments in sugar total about $650,000,000, of which United States investments are about $300,000,000. United States interests control 30 of Cuba's 161 sugar mills. Because Cuba is the world's largest producer of cane sugar, domestic and international controls are used to limit production, allocate markets, and control prices. Cuba sells about half its sugar to the United States, which, under its quota system (the Sugar Act of 1948, as amended and extended to 1960), gives Cuba an average annual quota of 2,960,000 short tons at prices substantially above world market prices. Despite this virtual subsidy, Castro and members of his government repeatedly criticized the United States in 1959 for treating Cuba unfairly in respect to sugar imports.

Sugar production at the end of the 1959 grinding season was estimated at 5,787,823 Spanish long tons, or 12,177 tons below the authorized quota of 5,800,000 Spanish long tons set by the government. As of July 15, 1959, Cuba had exported 2,541,109 Spanish long tons of sugar, as compared with 3,444,469 Spanish long tons in the same period in 1958. Exports of sugar to the world market (excepting the United States) were only 744,393 tons, as compared with 1,470,485 tons for the same period in 1958. However, the sale in September 1959 of 330,000 tons of sugar to the USSR (of which 100,000 tons were scheduled for 1959 delivery) and of 150,000 tons to France (30,000 tons in 1959) helped to reduce Cuba's sugar surplus. Low world prices for sugar, plus a decline in sugar production and in exports, created many of the economic difficulties faced by the Castro government during 1959.

Cuba produces high-quality tobacco, exports of which increased from $39,500,000 in 1951 to $98,325,700 in 1956 but then declined to about $52,000,000 in 1958. Cuba must import about a third of the foodstuffs it requires.

Land Reform.—The heart of Castro's revolution is drastic reform of land tenure and methods of farming. The Agrarian Reform Law, signed on May 17 and promulgated on June 4, 1959, provides that no foreigner can be a shareholder in a Cuban cane stock company, that only Cubans can purchase land in the future, and that no foreigner can inherit land. All land holdings above 995 acres are subject to expropriation by the government, unless such lands are being used for cattle, rice, or sugar production, in which case the maximum is 3,316 acres.

DARCY IN (LONG ISLAND) NEWSDAY

"Babe in the Woods"

The government will pay for the land it expropriates with 20-year, 4½% bonds which are not convertible into dollars. The value of the expropriated lands will be determined by their tax value prior to Oct. 10, 1958. As tax valuations are extremely low in Cuba, this provision permits the government to take the land it wants at a fraction of its market value. The government proposes to divide some of the expropriated land among 200,000 landless Cubans, each receiving 66 acres without cost and with the privilege of forcing the owner to sell more land up to a total of 147 acres. However, the recipient cannot sell or mortgage the land he acquires, and only one person of a family may inherit it.

A National Agrarian Institute (INRA), headed by Castro and directed by leftist Prof. Antonio Núñez Jiménez, was created to administer the law and has absolute power over every aspect of the land-reform program. Each farmer must cultivate the crops INRA tells him to cultivate or forfeit the land. INRA will operate cooperatives and administer public monopolies for the domestic and international sale of various commodities. On June 11, 1959, the United States sent a note to Cuba expressing "serious concern" over the compensation to be paid United States citizens for their property (about 1,663,000 acres) which might be expropriated. Cuba rejected the protest on June 15. The first seizure of land took place on June 25, 1959, and involved 2,357,600 acres of ranch land in Camagüey Province. As much as 8,250,000 acres are subject to expropriation under the law. The largest property expropriated (on November 15) was the 33,500-acre King Ranch,

which was owned largely by United States interests.

Principal Events, 1959.—Military trials of supporters of former President Batista began in the capital almost immediately after Dr. Fidel Castro arrived in Havana on January 8. Many United States congressmen and newspapers protested the summary executions and trials, which proceeded without benefit of due process of law under the Cuban Constitution and legal system. Major Jesús Sosa Blanco was the first to be tried (January 22) in the great sports arena in Havana before 18,000 spectators and before radio and TV audiences. Although 45 witnesses testified against him, he was not permitted adequate legal facilities for his own defense. The major was condemned to death (January 23) in both this and a later trial, but the excesses of this kind of procedure were too great for the administration to bear, and other scheduled trials in the sports stadium were canceled on January 26.

On March 3, Castro denounced the acquittal on the previous day of 43 air force men by a court martial in Santiago de Cuba, and declared that the accused would be tried again. This was done and the men found guilty were sentenced to long prison terms. When questioned as to why due process of law was being denied accused persons, Castro declared that "revolutionary justice" was based not on legal precepts but on the "moral conviction" of the people. On May 11, the government announced that the military trials were to stop and civil courts were to try future cases. However, more than 500 persons met death by firing squads as a result of the military trials. In addition, civil courts were permitted to impose the death sentence and long prison terms for all counter-revolutionary activities. Persons so accused could be refused bail and held until trial. By the end of the year, Cuban jails held many political prisoners. Among them were three United States citizens who had been convicted December 8 for alleged counter-revolutionary activities and sentenced to 25–30 years in prison; two of the three men were pilots, and all denied the government's charges.

As early as April 18 it was charged that revolutionary organizations had been formed in Cuba to invade Panama, the Dominican Republic, Nicaragua, and Haiti. On April 26, armed men landed at Playa Colorado in Panama. Premier Castro denied (on April 28) that Cuba had anything to do with the invasion. The bulk of the invaders capitulated on May 1, and it was found that most of them were Cubans. On June 3, an airborne invasion of Nicaragua took place, for which Nicaragua blamed Cuba. On June 14, armed men landed at the airport at Constanza in the Dominican Republic, and on June 19 an invasion was attempted at Maimon Bay. The Dominican Republic blamed Cuba for the two invasions, although both were repulsed. On August 13, an abortive invasion of Haiti occurred, and the Haitian government charged (on August 24) that officers and soldiers in the Cuban revolutionary army had participated. The inter-American conference of foreign ministers held at Santiago, Chile, in August attempted to deal with tensions in the Caribbean. (See also INTER-AMERICAN AFFAIRS; ORGANIZATION OF AMERICAN STATES.)

Premier Castro visited Venezuela in late January, and the United States, Canada, Argentina, Uruguay, and Brazil in April and May. During his unofficial visit to the United States on April 15–27, he said he sought "good relations and good economic understanding" and declared that the revolution in Cuba had been "misrepresented" abroad.

By April 10, defectors such as Rafael del Piño were claiming that the 26th of July Movement was Communist infiltrated. Many Cubans were arrested on April 14 and April 20 for counter-revolutionary plots, and the government frustrated a plot on June 5. On June 30, Maj. Pedro Luis Díaz Lanz, chief of the air force, resigned and charged that the armed forces were Communist influenced. He escaped in a small boat to Miami, Fla., and later charged before a United States Senate committee that Castro and high officials in the government were Communists. These and similar charges were repeatedly denied by Castro and other Cuban officials throughout the year. Between August 10 and August 12, about 4,500 persons were arrested for allegedly plotting against the government. Late in the year sporadic gunfire and bombings occurred in the capital and subversive pamphlets were dropped from airplanes. The main opposition group seemed to be an organization called the White Rose, which was headed by Dr. Rafael Díaz-Balart, former brother-in-law of Castro who was residing in New York City. On November 10 the White Rose movement named Dr. Domingo Gomez Gimeranez, physiologist at Columbia University, as its choice for provisional president. Maj. Hubert Matos, military chief of Camagüey Province and one of the leaders of the revolution, was arrested after he had resigned his position on October 20 and had charged that Communists had penetrated the government. On December 15 he was sentenced by a military court to 20 years' imprisonment.

On October 21, a plane dropped leaflets over

(*Left*) Cuban revolutionary troops made a triumphal entry into Havana, January 8, after week-long victory march from Santiago. Here, the son of Fidel Castro, revolutionary leader, stands among rebel troops atop a tank during celebration. (*Right*) Fidel Castro (at microphone), shown with his brother Raúl, led insurgent forces that overthrew the Batista regime.

WIDE WORLD

WIDE WORLD

In January, Batista followers accused of "war crimes" faced large public trials, as did Major Jesús Sosa Blanco, who appeared on trial before 18,000 spectators in a Havana sports arena (right photo). Following a courtroom retrial during which he was confronted (left photo) by a woman who accused him of killing her son, Major Sosa Blanco was executed on February 18. Military tribunals (suspended in May but re-established in the fall) ordered over 500 executions in 1959.

Havana and armed men in cars fired at street crowds, reportedly killing 2 persons and wounding 45 others. Two days later, Premier Castro accused the United States of permitting a plane to bomb the capital. At a huge rally held in Havana on October 26, many violent anti-American speeches were made by officials of the government. The United States replied that there was no evidence of any bombing, although the Federal Bureau of Investigation reported that Maj. Pedro Díaz Lanz (who was arrested by United States authorities in Florida on November 4) had admitted piloting a plane which dropped leaflets over Havana on October 21. A United States note delivered on November 9 describing Cuban reports of the so-called bombing incident as "inaccurate, malicious, and misleading" was rejected by Cuba and termed "absolutely false." In early November the Justice Department took steps to prevent unauthorized flights to Cuba from the United States.

During the tenth National Labor Congress held in Havana on November 18–23, the Cuban Confederation of Workers announced its withdrawal from the anti-Communist Inter-American Regional Organization of Labor, which was described in a resolution as an "agency of American imperialism;" and the congress voted to form a confederation of revolutionary workers of Latin America. However, the labor movement refused to elect Communists to its executive committee. Premier Castro addressed two tumultuous sessions of the congress and called for labor's "complete unity" in defending the Cuban revolution.

To what extent the revolutionary government was Communist dominated could not be determined objectively by the end of the year. However, there was no doubt that Castro's government had taken no steps to suppress the Communists as long as they supported the revolution. Castro's campaigns against prostitution, narcotics, corruption, and unregulated gambling undoubtedly benefited the great majority of the Cuban people. Despite his personal popularity, however, opposition to Castro and his government was mounting by the end of 1959.

CUSTOMS, Bureau of. Revenue collected by this bureau for the fiscal year 1959 amounted to nearly $1,304 million. Of this amount, over $954 million was derived from duties and miscellaneous customs collections. The balance comprised internal revenue taxes on imported merchandise. Approximately 40% of all imports into the United States were duty free.

During 1959 more than 41 million vessels, aircraft, automobiles, buses, trains, and other vehicles brought over 143.5 million persons into the United States, and almost 28 million persons walked across the nation's borders, all subject to customs inspection.

Air travel continued to increase, with the arrival of over 169,500 aircraft carrying over 3,750,000 passengers. (See also TOURISM.) Preflight customs clearance for persons departing on direct flights to the United States was in effect at Montreal, Toronto, and Winnipeg, Canada.

During the fiscal year 1959, 1,312,000 formal entries of merchandise were filed involving 2,043,000 invoices covering imported merchandise. Appraisers' personnel examined 1,454,000 packages. Customs laboratories again analyzed over 120,000 samples, a large majority being "import" samples of dutiable merchandise analyzed to develop and report facts needed for tariff classification purposes.

Continuing as major enforcement problems in 1959 were the smuggling into the United States of narcotic drugs, marihuana, psittacine birds, and diamonds, and the smuggling out of arms, ammunition, and implements of war, due to conflicts in Cuba and other Caribbean countries. The use of fraudulently undervalued invoices for filing customs entries for imported merchandise also continued as a major problem.

Seizures of merchandise throughout the country for violations of laws enforced by the Customs Service totaled 13,116, with an appraised value of $10,876,858. This total included 580 automobiles and trucks, 22 aircraft, and 33 boats. There were 1,255 arrests for violations of laws enforced by the Customs Service.

During the fiscal year, 2,580 vessels never before documented were added to the nation's merchant fleet. The newly documented vessels roughly reflected the total number of such vessels of all sizes built. Of the total of 47,157 documented vessels, slightly more than 4,200 were listed as yachts, while nearly 43,000 were authorized through documentation to be used in commercial activities in the foreign, coastal, or fishing trades. There were 1,494 vessels removed from documentation.

The booklet *Customs Information for Exporters*

to the United States, designed to assist American importers and foreign exporters to the United States, was revised to incorporate all recent legislative and procedural changes.

Public Law 86–14, approved April 22, 1959, permits articles imported for exhibition or for use in constructing, installing, or maintaining foreign exhibits at trade fairs to be entered free under bond.

The uniform worn by customs employees has been redesigned and will be the same for all areas throughout the Customs Service. Customs inspectors will now be easily distinguishable from the inspectional force of other government agencies, thereby eliminating confusion in the minds of the public.

RALPH KELLY,
Commissioner of Customs.

CYCLING. See SPORTS, GAMES, AND SHOWS.

CYPRUS. Situated some 40 miles from the coast of Turkey, Cyprus is the third largest island (area, 3,572 square miles) in the Mediterranean Sea. Until 1959 the island had been for 81 years a British crown colony, but it was to become (sometime in 1960) an independent republic under a tripartite agreement signed in London a year earlier between the governments of Great Britain, Greece, and Turkey. The population was estimated in 1958 at 549,000 (80% of Greek origin; nearly 18% are Turkish). The capital and largest town is Nicosia (1956 pop., 81,700, including suburbs); principal ports (with 1956 estimated populations) are Famagusta (26,800), Limassol (36,500), and Larnaca (17,900).

Government.—In 1959, Sir Hugh Foot served (since Dec. 3, 1957) as governor and commander in chief of the crown colony. On Dec. 13, 1959, Archbishop Makarios was elected president of the new republic which is to come into being in 1960; earlier, Dr. Fazil Kutchuk had been chosen as vice president. (Details on the establishment of the new republican form of government are stated below under *Principal Events.*)

Finance.—In 1958, revenue was estimated at £23,328,653; expenditure at £23,719,296. Allocations to the development program totaled £2,449,646.

Education.—As of Oct. 1, 1958, there were 744 primary schools, with 80,000 pupils, and 54 secondary schools (23,600 pupils). Other facilities include a teacher-training college (360 students in 1958), a technical institute, two secondary technical schools, and one preparatory technical school.

Economy.—Predominantly agricultural, production in 1958 consisted chiefly of wheat (78,000 tons, from 197,000 acres), barley (71,900 tons, from 148,000 acres), and grapes (68,700 tons). Livestock comprised sheep (394,000), goats (132,000), and cattle (31,300). Industrial production in 1958 included cement (81,700 tons), and 178 million kw.-hr. of electricity were generated. Copper deposits have been worked since ancient times. Mineral production for export in 1958 consisted chiefly of iron pyrites (820,000 tons) and cupreous pyrites (229,000).

Total imports, valued at £36,700,000 in 1958, were chiefly unworked iron and steel (30,404 tons), metal manufactures (valued at £1,380,000), motor cars (3,251 units), commercial vehicles (410), and nitrogenous fertilizers (26,800 tons). The value of total exports in 1958 was £17,600,000. Besides copper concentrates, exported products included oranges, 73,300,000 pounds; grapefruit, 8,863,000 pounds; lemons, 12,574,000 pounds; cattle hides and skins, 3,120 cwt.; and sheepskins, 2,270 cwt. Cyprus' chief customers are the United Kingdom, West Germany, the Netherlands, and the United States, which in 1958 took exports valued at £1,143,000.

Transportation and Communications.—Seven airlines maintain regular services to Cyprus; 102,223 civilian passengers passed through Nicosia airport in 1957. Regular steamship passenger services are supplied by the Adriatica Line, Hellenic Mediterranean and Nomikos Lines, and the Zim (Israeli) Line. Cyprus' 800 miles of asphalted roads are linked with a network of 2,900 miles of good secondary roads.

Principal Events, 1959.—After four years of guerrilla warfare in mountainous terrain, and of murderous civil strife in the principal towns, agreement on the future of Cyprus was reached with unexpected ease when the prime ministers of Greece and Turkey met in Zurich, Switzerland, early in February. With the assent of the Greek ethnarch of Cyprus, Archbishop Makarios, the demands of Greek Cypriotes for *enosis* (union with Greece) were withdrawn; in turn, the Turkish government no longer insisted that Cyprus be partitioned but agreed instead to a comprehensive plan for an independent republic, with a presidential regime as the basic structure of future government of the island.

British interests affected by the plan were satisfied by provision that military bases would remain under full British sovereignty in two areas at Akrotiri-Episkopi-Paramali and Dhekelia-Pergamos-Ayios-Nikolaos-Xylophagou. Britain would also retain use of facilities at the port of Famagusta and the Nicosia airport. Prime Minister Harold Macmillan accordingly signed on Feb. 19, 1959, a joint memorandum with the heads of the Greek and Turkish governments, in which future political and administrative arrangements were defined as follows:

Not later than a year from the agreement, a republican State of Cyprus was to be formed, with a Greek president and Turkish vice president elected by universal suffrage for 5-year terms by the Greek and Turkish communities, respectively. Sharing authority with the executive will be a Council of Ministers (7 Greek and 3 Turkish members), designated respectively by the president and vice president, who together have final veto powers over the council's decisions. Legislative authority is to be vested in a House of Representatives (a membership of 50 was determined later) elected in the proportions of 70% Greek and 30% Turkish by the chief ethnic communities on the basis of universal suffrage. In addition, each community is to have its own communal chamber, with the right to impose taxes to support local organizations and institutions. Specific areas of authority for the communal chambers include religion, education, sporting and charitable foundations, and producers' and consumers' cooperatives and credit establishments. Separate municipalities are to be created in the five largest towns by the Turkish communities in them.

A High Court of Justice constitutes the chief organ of the judicature, superseding the Supreme Court which, under British administration, had appellate jurisdiction over the decisions of all other courts. Both civil and criminal justice in the republic are on a communal basis, with the High Court determining the composition of mixed tribunals in cases where parties to disputes belong to different communities.

The civil service is to be composed of 70% Greeks and 30% Turks. The same proportions hold good with respect to the 2,000 members of the security forces (gendarmery and police). The regular army of 2,000 men is to consist of 60% Greeks and 40% Turks.

Under the tripartite agreement, Cyprus' foreign relations are governed by a treaty of guarantee, which the contracting parties must register with the Secretariat of the United Nations and which provides that the republic shall not participate in any political or economic union. A further agreement (in effect a treaty of alliance) provides for the setting up in Cyprus of a tripartite military headquarters, in which Greek and Turkish contingents are to number respectively 950 and 650 men of all ranks.

To effect the transfer of authority to the new republic, a joint commission was at once established for the drafting of a constitution. The reorganization of governmental machinery was in the

hands of a transitional committee, while in London there was formed a tripartite committee to deal with questions of nationality, the treatment of liabilities of the existing government, and other financial and economic problems.

The British administration proceeded at once to liquidate the emergency restrictions imposed on Cyprus in 1955, although there was an aftermath of political threats amid occasional incidents of continued terrorism. Amnesty was announced on Feb. 27, 1959, for political prisoners, 83 of whom were immediately released. Major terrorists, including Lt. Gen. George Grivas, head of the outlawed Greek underground organization, EOKA, were assured freedom from arrest and trial if they agreed to leave for Greece or Turkey and not return to Cyprus.

In August a new secret political organization calling itself KEM (Greek initials for Cyprus Enosis Front) declared its intention of renewing the struggle to free Greek Cypriotes "by force if need be." Earlier in the year 5,000 Greek Cypriote delegates attended a congress in Nicosia of EDMA, a right-wing political organization formed by district leaders of the old EOKA movement. Reportedly, arms continued to be smuggled into Cyprus, but interference with the smooth transition to republican independence came principally from the activities in his native Greece of General Grivas. Having at first endorsed the tripartite agreement, he dissociated himself from it on returning to Athens, and, after a split with Archbishop Makarios, attacked the leadership of Greek Premier Constantine Karamanlis in the context of the Cyprus settlement.

The rift with Makarios was reported healed on October 9. On October 17, Governor Sir Hugh Foot, British leader on the transitional committee, left for London to discuss with colonial officials difficulties in the way of setting up an independent Cyprus, including evidence which had come to light of a conspiracy by a new Greek Cypriote movement to overthrow the incoming regime.

The Greek community elected Archbishop Makarios president of the new republic by an overwhelming majority on December 13. Parliamentary elections to choose 35 Greek and 15 Turkish members of the House of Representatives were scheduled to be held in 1960.

Author and Publicist.

WIDE WORLD

Glasses are raised in toast by Prime Ministers Constantine Karamanlis (left) of Greece and Adnan Menderes of Turkey, following agreement in Zurich, February 11, on a plan for the future of Cyprus. Final approval of independence for the British crown colony came in London, February 19.

CZECHOSLOVAKIA. A Soviet-dominated and Communist-ruled people's republic in central Europe, Czechoslovakia is bounded on the north and northeast by Poland, on the east by the USSR, on the south by Hungary and Austria, and on the west and northwest by Germany. It has an area of 49,354 square miles, and its population is estimated (December 1958) at 13,518,000 (9,596,000 in Czech parts of the country and 3,922,000 in Slovakia). The chief cities, with their 1957 census populations, are Prague (Praha), the national capital, 978,049; Brno, 306,662; Ostrava, 221,831; Bratislava, capital of Slovakia, 246,523; Pilsen (Plzeň), 134,188; and Olomuoc, 73,800. Of the total population (1957), 66% are Czechs, 28% are Slovaks, and 3.5% are Magyars. There are also German (163,000), Polish (78,000), and gypsy (120,000) minorities.

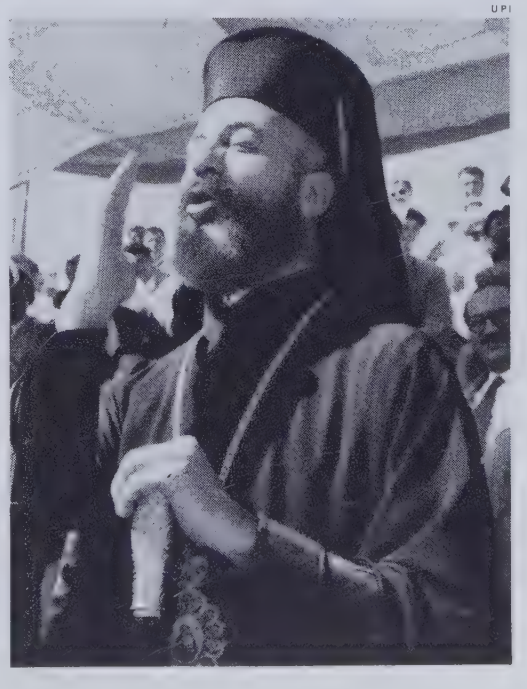
Government.—The constitution of 1948 provides for a unicameral National Assembly, whose 368 deputies are elected for 6-year terms; the Presidium of the National Assembly, the highest legislative body when the assembly is not in session; and the cabinet. The present National Assembly was elected on Nov. 28, 1954. The assembly elects the president of the republic for a term of 7 years; Antonin Novotný, first secretary of the Communist Party, was elected president on Nov. 19, 1957. Vilém Široký, the premier, was elected on March 21, 1953. Slovakia, which is guaranteed a small measure of local autonomy, has its own 100-member National Council and Board of Commissioners. A constitutional amendment of July 1956 granted Slovakia extended powers in matters of economic planning and development.

All power in Czechoslovakia is vested in the Communist Party, which rules the country through its own local and national organizations and through the National Front and its branches. In addition to the Communist Party, the National Front includes splinter groups from the prewar democratic parties. The Communist Party of Czechoslovakia is headed by President Antonin Novotný, first secretary of the Central Committee, and Karel Bacílek, first secretary of the Slovak Communist Party, a subsidiary of the Czechoslovak Communist Party. In 1958 the party had 1,422,199 members; its Slovak subsidiary had 191,690 members (1956).

Education.—The Czechoslovak educational system has been secularized and nationalized. A law of April 24, 1953, established a unified school system. Objectives are to model the school system of the country on that of the Soviet Union; the Soviet-type 11-year schools have been established, and, as in the Soviet Union, a law provides for nine years of obligatory schooling, including part-time work in

Archbishop Makarios, Greek Cypriote leader, who was elected president of Cyprus in balloting on December 13.

UPI



agriculture and industry. Also, a more thorough study of Marxism-Leninism was prescribed in order to give the students an "adequate" preparation for life in a Communist society. In 1956 there were 1,943,638 students in primary and secondary schools, 192,000 students in technical and vocational schools, and 75,000 in universities. In 1959, 1,590 foreign students from 52 countries were enrolled in Czechoslovak universities. There are four universities: Charles University in Prague and the universities of Brno, Bratislava, and Olomuoc. In May 1959 a Czechoslovak Institute was opened in Cairo, the announced purpose of which is to avail Czechoslovak scholars of the opportunity to specialize in Egyptology and Arabic studies.

Religion.—According to a 1951 estimate, the population was distributed as follows: Roman Catholics, 9,600,000; Protestants, 1,000,000; members of the Czechoslovak Church, 950,000; Jews, 15,000 (est. 1959); Eastern Orthodox, 60,000, and persons claiming no religious affiliation, 900,000. A law of Oct. 14, 1949, made the clergy civil servants of the government, and clergymen were obliged to sign an oath of allegiance to the state. A special agency for church affairs handles religious matters. The official policy of the government is to discredit and destroy religion.

Finance.—The Czechoslovak monetary unit is the koruna (crown), with an exchange value of 1.80 koruny to 1 ruble, or 7.20 koruny to U.S.$1 (1 koruna = U.S.-$0.1389; the tourist rate in 1959 was 14.34 koruny to U.S.-$1). The 1959 budget provides for revenues of 96.2 billion koruny (94.7 billion in 1958) and expenditures of 95.9 billion koruny (94.5 billion in 1958). Of the total expenditure, 45.7 billion koruny was allotted to the national economy and 8.8 billion koruny to national defense. In 1959, 23% of the national expenditures will go to social insurance, an increasingly important factor in the Czechoslovak economy. Slovakia's share in the 1959 national budget amounted to 15.7 billion koruny in revenues and 17.5 billion koruny in expenditures.

Transportation and Communications.—Czechoslovakia had 8,182 miles of railways in 1956, and 43,867 miles of roads (1946). The Danube and Vltava (Moldau) rivers are navigable for a total of 281 miles. The state airline service connects Czechoslovakia with 18 foreign countries and serves major cities inside the country. The country had 764,000 telephones and 3,020,000 radio receiver licenses in 1958; there were 450,000 television receivers in 1959. The Czechoslovak merchant fleet consists of eight vessels, three of which were launched in 1959.

Agriculture.—In 1959, Czechoslovakia endeavored to increase its agricultural production, which still represented the weakest sector in the nation's economy. The Second Five-Year Plan (1956–60) provided for a 27% increase in farm production by 1960, but indications are that this target is not being achieved. In 1958 the country imported 1 million tons of grain and 92,000 tons of meat. A plan for the reorganization of collective farms and the transfer to them of the equipment of the Machine Tractor Stations was announced in March 1959. Also, the multiple-price system was abandoned in June and farm prices were increased by 14.7%. Simultaneously, price cuts were effected in farming tools, electricity, and certain other items important in agricultural production. By mid-1959 there were 12,365 collective farms, with a total membership of 912,000 people, controlling 74.7% of the country's arable land. President Novotný, at the Fourth Congress of Collective Farms in Prague on March 19–22, 1959, called for the complete collectivization of Czechoslovakia by 1961.

Production of major agricultural items in 1957 and 1958 was as follows (in thousands of metric tons):

1957		1958	
Wheat	1,525	Meat products	173
Barley	1,362	Sugar beets	6,906
Rye	948	Fats	59
Oats	899	Hops	7
Potatoes	8,756	Milk (million liters)	898

Industry.—The official production figures for 1958 indicate increases over 1957 in the following percentages: industrial production, 11.3%; consumer goods, 10.6%; and the means of production, 11.8%. The Second Five-Year Plan (1956–60), which emphasized the development of heavy industry, was revised in October 1957 to increase gross industrial production by 56% instead of the 50% originally planned. Goals for 1959 (the fourth year of the plan) provided for a 9.3% increase in industrial production and a 12.6% increase in capital construction. An important aspect of the emphasis on rapid industrial growth has been the increase in the number of women in the labor force. In 1958, 2,563,000 women were employed, representing 42.2% of the labor force.

CZECHOSLOVAK INDUSTRIAL PRODUCTION

Product (and unit of production)	1957	1958
Coal, hard (million tons)	24.2	25.8
Coal, brown (million tons)	49.0	54.3
Lignite (million tons)	2.2	2.5
Pig iron (million tons)	3.6	3.8
Crude steel (million tons)	5.2	5.5
Rolled steel (million tons)	3.5	3.8
Sulfuric acid (thousand tons)	445	463
Nitrogenous fertilizer (thousand tons)	...	108
Phosphorous fertilizers (thousand tons)	...	117
Gasoline (thousand tons)	...	355
Synthetic fibers (thousand tons)	...	55
Electric power (billion kw.-hr.)	17.7	19.6
Motor vehicles (units)	50,820	43,000
Motorcycles (units)	138,347	147,000
Radios (units)	254,169	...
Television sets (units)	79,107	...

The midyear report for 1959 indicated that total industrial production increased by 11% above the corresponding period in 1958, and that labor productivity was up 8.5%. (See also IRON AND STEEL.)

Industry's share of the Czechoslovak gross national product in 1955 was 65.2%, compared with 14.3% for agriculture; the Czechoslovak Chamber of Commerce forecast for 1960 a ratio of 67.7% to 11.8%.

Foreign Trade.—In 1958, Czechoslovakia's foreign trade totaled about 21.1 billion koruny, as compared with 20 billion koruny for 1957. Chief exports were industrial equipment and machinery; principal imports were agricultural products and raw materials. Most of the foreign trade of Czechoslovakia is with Communist countries (68% of total trade in 1958), principally with the USSR, East Germany, China, Poland, and Hungary. In 1958 trade with non-Communist countries was dominated by West Germany, Great Britain, Switzerland, and Austria. Trade with China in 1957 climbed to 587.8 million rubles, as compared with 105 million rubles in 1950. United States imports from Czechoslovakia in the first half of 1959 totaled $5.1 million, as compared with $2.7 million in the corresponding period of 1958. In the first half of 1959, total foreign trade was up 7.6% over the comparable period in 1958.

Principal Events, 1959.—The Communist theorists of Czechoslovakia continued in 1959 to insist on ideological purity and the application of policies determined by Moscow. A few governmental changes occurred during the year. In January the minister of foreign trade, Richard Dvořak, became ambassador to the Soviet Union; he was replaced by František Krajcir, former minister of internal trade, who in turn was succeeded by Ladislaw Brabec, first deputy minister of internal trade. In March, Otokar Simunek was appointed deputy premier and chairman of the state planning commission, Rudolf Barak became deputy premier, and Lubomir Strougal replaced Michal Bakula as minister of agriculture and forestry. Josef Tesla, minister without portfolio, resigned. On February 19, Miloslav Ruzek was appointed ambassador to the United States, succeeding Karel Petrzelka.

In February, 175 people were arrested for "stockpiling arms for an antistate plot," and alleged "American intelligence agents" engaged in nefarious Western plots were reported on several occasions. Also in February, six persons were convicted on charges of serving as foreign spies and

agents. The witch hunt of previous years continued although there were fewer officially concocted spy scares.

More important, however, was the continued drive to harness writers, artists, composers, and other intellectuals to unswerving loyalty to the government and the Communist Party. At a conference of the Czech Writers' Union held in March, the hard core of the one-time Stalinist group was elected to the Central Committee of the union. The speakers urged continued struggle against all manifestations of revisionist tendencies. At a meeting in February, the Composers' Union similarly voted loyalty to the party. As the year closed, it appeared that Stalinists were in full command of the political situation.

President Novotný told other Communist leaders on October 24 that the existing territorial administrative units had outlived their usefulness and that the time had come to shift economic responsibility to smaller units closer to the centers of production. This policy is similar to that announced by the Soviet Union in 1957 and by certain other Communist states since then. Accordingly, the number of administrative units will be reduced, and many economic chores will be transferred from national and regional committees to district committees. Novotný also noted that the number of intermediate agencies between factories and stores must be reduced in order to facilitate distribution of goods.

In its foreign relations Czechoslovakia also echoed Soviet pronouncements and followed Soviet actions. Certain developments, however, concerned Czechoslovakia more directly. One of these was Czech shipments of arms and ammunition to certain troubled areas and the Western reaction to this kind of trading. In March and April it was reported that three ships had arrived in Guinea carrying small arms and light artillery pieces, and a number of Czech military advisers. On April 8 a similar shipment of arms bound for Morocco was seized by the French, who charged that the supplies were actually being sent to the Algerian rebels. Both Morocco and Czechoslovakia protested against the French action.

During the year Czechoslovakia protested alleged border violations by United States planes, and was in the forefront of Soviet-bloc press campaigns against West Germany. The most flagrant attack against West Germany came on the anniversary (March 15) of the German occupation of Czechoslovakia. A statement given to diplomatic representatives in Prague drew attention to many similarities between the present Bonn government and Hitler's Germany. The anti-West Germany campaign continued throughout the year as Czechoslovakia protested against the United States supplying West Germany with atomic armaments.

A propaganda campaign against Yugoslavia was carried on intermittently throughout the year. Premier Hoxha of Albania made a state visit to Prague on January 12–18, and the two governments issued a communiqué calling for a vigorous fight against "contemporary revisionism." New attacks against Yugoslavia came in June, and relations between the two countries were strained by the rupture of official talks concerning the extension of time for Yugoslavia to avail itself of Czech credits obtained in 1956.

Czech representatives attended a meeting of foreign ministers of the Warsaw Pact countries at Warsaw on April 27–28, where it was decided to assume a "moderate" position in the approaching East-West foreign ministers talks at Geneva. At the meeting on May 13–16 of the Council for Mutual Economic Assistance at Tiranë (Albania), Czechoslovakia was included in the new electrical grid system which will combine eastern European power networks with those of the Soviet Union in the Ukraine and Kaliningrad. Czechoslovakia was also included in the ten-nation Disarmament Committee which was established in September outside the United Nations by the United States, Great Britain, France, and the Soviet Union (see DISARMAMENT).

The most important state visit in 1959 was that by President Novotný, who visited (September–October) Communist China, North Korea, and the Mongolian People's Republic. Czechoslovakia closely followed Khrushchev's visits to the United States and China in September, and lauded the Soviet leader for his alleged efforts in working for peace.

In the course of the year, two minor diplomats defected from their posts and requested asylum. On May 21, Jan Maier, second secretary of the Czechoslovak embassy at Teheran, was granted asylum by Great Britain, and it was announced on November 4 that Lt. Col. František Tisler, Czechoslovak military attaché in Washington, D.C., had asked asylum for his family and himself.

WAYNE S. VUCINICH,
Professor of History, Stanford University.

DAHOMEY. The Republic of Dahomey is an autonomous republic of the French Community (q.v.), situated in western Africa on the northern coast of the Gulf of Guinea. Estimated area, 44,696 square miles; pop. (est. 1958), 1,725,000, including (in 1956) 2,767 nonindigenous persons, mainly French. The official language is French. Chief cities are Porto-Novo, the capital (est. pop., 30,500), and Cotonou (21,300), an important port.

Government.—A former French overseas territory included within the federation of French West Africa (q.v.), Dahomey chose the status of a member state of the French Community on Dec. 4, 1958. As an autonomous republic, Dahomey has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic minerals, and certain other matters. Dahomey adopted its constitution on Feb. 14, 1959. The Legislative Assembly consists of 70 members elected for a five-year term by universal suffrage. The premier and his ministry are invested by an absolute majority in the assembly. Hubert Maga, leader of the Democratic Rally of Dahomey, is premier of a three-party government formed on May 22, 1959.

Education and Religion.—In 1958 there were 448 schools with a total of 78,224 pupils (29.1% of the school-age population). Expenditure on education amounted to 791.5 million francs CFA, or 24.6% of the budget. The natives are mostly animists, with some Christians in the south and Moslems in the northern interior.

Finance.—The ordinary budget for 1958 amounted to 3,209 million francs CFA; the extraordinary budget 325 million (the franc CFA equals 2 metropolitan francs). In the period 1947–57, funds granted to Dahomey under France's Economic and Social Investment Development Fund (FIDES) were equivalent to $49.9 million.

Transportation.—Railroads total 355 miles; the chief line connects Parakou, in central Dahomey, with the port of Cotonou in the south. Roads and trails aggregate 3,233 miles (1956), including 794 miles of highways. The main airport is at Cotonou. In 1959 an agreement was signed with France for the French financing of 10 billion francs over a 4-year period for the development of the port of Cotonou.

Production.—Agriculture, fishing, and cattle raising are the chief occupations. There is little industry other than handicrafts and local manufactures. Native subsistence crops include corn, cassava, yams, sweet potatoes, plantains, vegetables, and tropical fruits and nuts. Cattle, sheep, and goats are raised in the northern uplands, and fishing is of importance in the southern lagoons. Cash crops include palm kernels and palm oil, peanuts, coffee, and cotton.

Foreign Trade.—Exports in 1958 totaled 3,371 million francs CFA; imports, 4,329 million. Chief exports were palm kernels, 60,044 metric tons (1,665 million francs CFA); shelled peanuts, 15,617 (616 million); and palm oil, 12,178 (602 million). France took 79% of exports and provided 61% of imports.

Principal Events, 1959.—Elections for the 70-member Legislative Assembly took place on April 2. As a result of the gerrymandering of election districts, Premier Sourou Migan Apithy's Republican Party of Dahomey, with 144,000 popular votes, obtained 37 seats; Hubert Maga's Democratic Rally of Dahomey, with 62,000 votes, obtained 22 seats; while Justin Ahomadegbe's opposition Democratic Union of Dahomey, with 172,000 votes, received only 11 seats. Ahomadegbe violently protested the disproportionate seating, and clashes took place on April 3–4 between his supporters and those of Premier Apithy. At Apithy's request, French troops were flown to Cotonou on April 6 to maintain order. A compromise settlement was negotiated whereby Apithy's party obtained 28 seats; Maga's 22; and Ahomadegbe's 20. Maga then headed a new three-party coalition government on May 22.

M. J. G.

DAIRY PRODUCTS. United States milk production in 1959 was about 124.7 billion pounds, according to preliminary estimates of the Agricultural Marketing Service of the U.S. Department of Agriculture. Such production would be slightly less than the 125.2 billion pounds in 1958 and 1% below the 1957 record output of 125.9 billion. Annual milk production per cow rose to 6,430 pounds, compared with 6,330 in 1958 and 5,272 in 1949. The number of milk cows at midyear 1959 was estimated to be 19,320,000, as against 19,799,000 a year earlier and 22,027,000 in 1949. The general trend in milk cow numbers has been downward since 1944, the sole exception being 1953.

The milk equivalent of the Commodity Credit Corporation's purchases for price support was about 30% lower in 1959 than in 1958. Total purchases were about 3,170 million pounds in 1959, compared with about 4,504 million pounds a year earlier. The 1959 purchases were equivalent to about 2.5% of milk production, as against 3.6% the preceding year. Purchases of butter and nonfat dry milk were lower in 1959 than in 1958, but cheese purchases were moderately larger. The corporation's holdings of butter were exhausted in 1959, and uncommitted stocks of dry milk and cheese were reduced to very low levels, partly because of the European drought.

Per capita consumption of dairy products was a little larger in 1959 than in 1958. Consumption of fluid milk and cream was estimated at 348 pounds per person, 3 pounds above 1958 but otherwise one of the lowest levels in recent years.

U.S. PER CAPITA CONSUMPTION OF CERTAIN DAIRY PRODUCTS AND MARGARINE

(In pounds)

	1935–39	1946	1950	1958	1959[1]
Fluid milk and cream	330	389	349	345	348
Evaporated milk	15.1	17.1	18.1	12.4	11.7
Frozen dairy products	24.9	57.9	45.0	48.8	50.3
Cheese	5.6	6.7	7.7	8.2	8.3
Butter	17.0	10.5	10.7	8.4	8.3
Margarine	2.9	3.9	6.1	9.0	9.2

[1] Preliminary.

According to preliminary estimates, milk production in the principal dairying countries decreased about 1% during 1959. Output in Western Europe was down 2% due mainly to droughts in France, Sweden, Ireland, and the United Kingdom. In some other Western European countries, such as Austria, Denmark, West Germany, and Italy, there were moderate increases in production.

MILK PRODUCTION IN PRINCIPAL COUNTRIES

(In million pounds)

	1951–55	1957	1958	1959[1]
Canada	16,026	17,306	18,057	18,005
Mexico	3,806	4,819	5,005	5,539
United States	118,959	125,939	125,236	124,700
Denmark	11,521	11,781	11,292	11,800
Finland	6,147	6,942	7,012	7,025
France	38,045	46,762	46,535	42,040
Germany, West	36,023	38,058	39,392	40,000
Ireland	5,256	6,365	6,139	5,525
Italy	16,663	18,614	19,045	19,425
Netherlands	12,654	13,098	13,759	13,895
Norway	3,554	3,843	3,790	3,870
Sweden	9,829	8,896	8,655	8,240
United Kingdom	23,251	26,481	25,874	24,845
Argentina	10,334	11,350	10,215	10,500
Australia	12,516	13,285	13,414	13,890
New Zealand	11,186	11,270	11,903	11,896

[1] Preliminary.

Compared with the annual average in 1951–55, world milk production was up about 8% in 1959. Sweden was the only major milk producing nation in which 1959 output was less than the 1951–55 average.

(See also AGRICULTURE; CHEESE; and the Index entry, *Dairy Products.*)

C. J. ENZLER,
Information Specialist, Office of Information, U.S. Department of Agriculture.

DAMS. Glen Canyon Dam.—This biggest dam under construction in the United States suffered in 1959 from a construction workers' strike which lasted from July 6 to December 22. It was the third construction year for this major dam in the U.S. Bureau of Reclamation's $760 million Upper Colorado River Project. The 700-foot-high, $108 million concrete structure has been figured as a seven-year project.

Before the strike slowed construction at Glen Canyon—which is in Arizona, 135 miles from Flagstaff and just south of the Utah state line—progress had been made on major diversion and spillway tunnels in the canyon walls. The river was diverted, and the damsite was completely dewatered and ready for the 4,770,000 cubic yards of concrete it will take to complete the massive structure. Spillway tunnels, mined in solid rock, had a 113-foot-wide clear opening, the widest tunnel opening ever spanned by support steel in United States construction history.

Flaming Gorge Dam.—Work proceeded on two other units of the Upper Colorado River Project. Flaming Gorge Dam was one of these. The sec-

ond year of construction began on this $30 million structure on the Green River, a Colorado tributary in northeast Utah. This 490-foot structure will be a relatively thin concrete arch, among the highest of its type.

Navajo Dam.—This is the other unit of the Upper Colorado River Project on which a start has been made. A $23 million project on the San Juan River in northern New Mexico, it will be a 385-foot-high earthfill dam to store water for irrigation of 110,000 acres. Fast progress was made in 1959 on placing and compacting some of the 26 million cubic yards of earth it will take to complete the dam by 1962. As the builders approached a million-yard-a-month rate of production in the summer of 1959, they had a chance to better the planned completion date by a year; the fill could be done by the end of 1961.

Priest Rapids Dam.—This $98 million Columbia River project in the state of Washington made news in 1959 because of its early completion. Its powerhouse began producing power in October, 16 months ahead of schedule. One by one the ten hydroelectric units will be put to work for an ultimate potential of 630,000 kilowatts. It is a local power agency's project.

Wanapum Dam.—Eighteen miles up the Columbia River from Priest Rapids Dam, the same power agency began construction in 1959 of Wanapum Dam, also in Washington. Construction bids taken in May proved the competing contractors to be anxious for the project, as all bids were far below the estimated cost. The low bid of $89 million was more than $48 million under the engineers' estimate. Wanapum will be largely an earthfill dam about 185 feet high from its crest to the bottom of its cut-off wall. Its spillway section and powerhouse section (10 generators to total 831,000 kilowatts) will be of concrete. Five years of construction are scheduled.

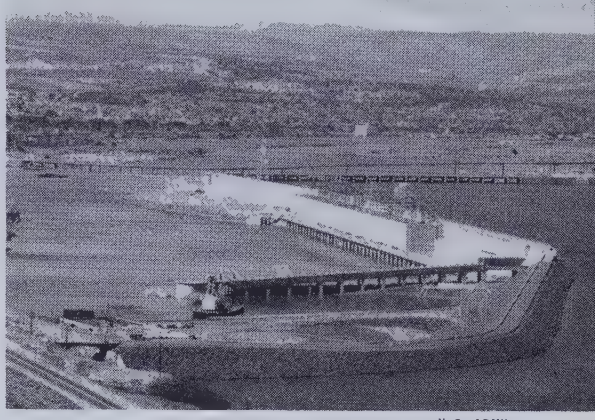
Rocky Reach Dam.—Farther north is another major power dam on the Columbia, Washington's $245 million Rocky Reach Dam which is to provide 775,000 kilowatts. Scheduled for completion in 1962, it was about half finished by the end of 1959.

The Dalles Dam.—Another Columbia River structure, The Dalles Dam in Oregon, was dedicated on October 10 in ceremonies in which Vice President Nixon participated. He pressed a button to start the tenth of 14 generating units which will be in operation by 1960, to produce a total of 1,119,000 kilowatts.

John Day Dam.—Approximately 25 miles upstream from The Dalles Dam, this $350 million structure went into its second year of construction. When finished in 1969, the John Day Dam is to yield a 1.2-million-kilowatt power capacity and provide a navigation lock with a 110-foot lift.

Hebgen Dam.—A very small and relatively old earth dam made news in 1959 as it held back the Madison River west of Yellowstone National Park, when a severe earthquake shook southeastern Montana. The 44-year-old structure suffered severe cracks along its crest, but its concrete corewall did not suffer seriously. The dam held, even though successive waves of water washed over it from its reservoir as the earthquake caused movement along its shore. Downstream from Hebgen Dam a quake-caused slide of 20 million cubic yards of earth and rock blocked the Madison River with a "natural dam," sloping from 200 to 400 feet in height. Engineers quickly had to bulldoze a 250-foot-wide spillway in this earth plug, so that the "lake" which formed behind it would flow over it in a controlled manner as it rose.

Oroville Dam.—This California structure, which at 730 feet will be the tallest dam in the United States and the tallest earthfill dam anywhere, moved nearer to construction with start of a $10 million bridge to relocate rail and road routes past its Feather River site. Oroville Dam is part of California's $1.6 billion Feather River Project, a plan to store water in the north for use all the way to the southern end of the state.



U.S. ARMY

The Dalles Dam, on the Columbia River 88 miles east of Portland, Oreg., was dedicated on October 10 by Vice President Nixon. Snow-capped Mount Hood towers in the background.

Trinity Dam.—Also in northern California is this 537-foot-high earthfill structure which the U.S. Bureau of Reclamation had well under way in 1959. The dam figured in the political news of 1959, when Congress turned down an administration-sponsored "partnership" proposal for the privately owned Pacific Gas & Electric Company to be permitted to develop power at this federal project. Instead, Congress voted $2.4 million to let the Bureau of Reclamation start work on what will be a $60 million powerhouse at the dam.

Snake River Dams.—Ice Harbor Dam on the lower Snake River is a $135 million project which was about half finished in 1959. It will produce power and also provide a 103-foot lift for navigation into the lower Snake. In the Upper Snake in Hells Canyon, Brownlee Dam had reached its capacity power output in January 1959. Oxbow Dam was due to be completed in 1960. These two plus a third scheduled dam to be started in 1961 will supplant a single high dam proposed for construction by the federal government in a long, drawn-out fight between public and private power protagonists over Hells Canyon.

Table Rock Dam.—The White River, between Missouri and Arkansas, is spanned by $66 million Table Rock Dam, completed in 1959. A flood-control and power project, this structure will also yield recreational benefits as it creates a great new lake in the Ozark Mountains.

Oahe Dam.—Work continued in 1959 on this 91-million-cubic-yard earthfill structure which will back the Missouri River up into a 250-mile lake in South Dakota. It is located near Pierre.

Tuttle Creek Dam.—Basically a flood-control structure on the Big Blue River near Manhattan, Kans., this $86 million project was under way in 1959 toward completion in 1962.

Hartwell Dam.—This is a $98 million concrete dam on the Savannah River between South Carolina and Georgia. It is due to be completed in 1963.

St. Lawrence Dams.—All units of the St. Lawrence Seaway and Power Project on the International Rapids section of the river between New York State and Ontario were finished in 1959 (see also SAINT LAWRENCE SEAWAY AND POWER PROJECT).

Europe.—In Italy, Vajont (Vaiont) Dam passed the halfway mark in construction in 1959. When finished it will, at 870 feet, be the world's highest arch dam. Because it will plug a very narrow gorge, its crest length will be only 623 feet. Built for hydroelectric power production, the dam will create a 220,000-kilowatt potential. Grandval Dam, completed in 1959 on the Truyère River in central France, is a novel multiple-arch structure with buttresses supporting the arches on the downstream side. A circular powerhouse nestles in one of the arches, and ski-jump spillways will carry reservoir discharge to either side of the powerhouse. The dam is 262 feet high and extends 1,100 feet across its valley, but required only 220,000 cubic yards of concrete.

In northern Spain, floodgates of the new Yesa Dam on the Aragon River were opened on April 8 to start Europe's largest irrigation project. Approximately 648,000 acres of the Bardeñas and Monegros deserts are expected to be reclaimed.

Asia.—After four years of construction near the Siberian city of Bratsk, the Soviet Union closed off the Angara River in June in a major step toward completion of one of the world's largest hydroelectric developments. The dam has to be raised an additional 300 feet to its expected above-river height of 400 feet. During the year some 100,000 persons were removed from the area expected to be covered by a 350-mile-long reservoir containing a record 145 million acre-feet of water. The project's power plant is expected to produce 3.6 million kilowatts. This capacity is more than that of the Lenin Volga Hydroelectric Station (2.1–2.3 million kilowatts), completed northwest of Kuibyshev in 1958, but less than that of the Krasnoyarsk project (4 million kilowatts), which is under construction on the Yenisei River. The reinforced concrete dams of the Volga project extend almost three miles from bank to bank, creating a body of water known as the Zhiguli Sea, which is 375 miles long and 25 miles wide.

Of the reportedly many hydroelectric, flood-control, and irrigation projects being built in Communist China during 1959, the biggest is on the Yellow River in Honan Province. This is the Sanmen Gorge water storage and hydroelectric project, which includes Chingtung Gorge Dam.

At India's great Bhakra Dam, which at 740 feet will rank behind the 940-foot height of Switzerland's Grand Dixence Dam when they both are finished, there were construction troubles in 1959. A break in a diversion tunnel sent waters of the Sutlej River pouring through access and inspection galleries in completed portions of the dam, bringing work to a standstill. A method of plugging the diversion tunnel must be undertaken, with a resulting delay in the project's completion.

Africa.—Construction continued on the first stage of the Kariba Dam, a great concrete arch structure on the Zambezi River in Rhodesia. The dam was scheduled to produce the first of its initial 600,000 kilowatts of power capacity in 1960. In a second stage, another 900,000 kilowatts will be added. During 1959 the clearing of land and the rounding up and transplanting of wild animals readied the reservoir area as water rose behind the dam. (See also RHODESIA AND NYASALAND.)

Egypt's Aswân High Dam remained in the news in 1959 as the USSR won control of the first stage of its construction through a Soviet loan of $92 million, announced Dec. 28, 1958, and sought control of the second stage as well. Stage one involves cofferdams and diversion of the Nile River; stage two would involve the main dam and powerhouse.

ARTHUR J. FOX, JR.,
Senior Staff Editor, "Engineering News-Record."

DANCE. Ballets: U.S.A.—The United States, long the stronghold of modern or expressional dance, saw a minor swing toward the classic idiom of ballet during the 1958–59 season. Not classic in point of view, but definitely so in basic technique, was Jerome Robbins' *Ballets: U.S.A.*, which had as its major offering, *N.Y. Export, op. Jazz,* an excursion into the pulse, tension, and brusque charm of slum-bred adolescents. A projected nationwide tour of the Robbins company, beginning with a New York City engagement in September and October 1958, had to be curtailed because of poor box office receipts. The dancers temporarily disbanded, then rejoined in the summer of 1959 to appear for a second time at the Festival of Two Worlds in Spoleto, Italy. A summer-into-autumn tour of Europe followed, with foreign audiences heaping acclaim on both choreographer and dancers. A new work, *Moves,* an abstract piece without music, was added for the European journey.

New York City Ballet.—During September 1958, the New York City Ballet presented the first part of a three-part 10th anniversary celebration. Only one new work was offered during this engagement —a *pas de deux* entitled *Waltz-Scherzo* (music by Tchaikovsky) in which choreographer George Balanchine created an array of quicksilver solos and duets for leading dancers Patricia Wilde and André Eglevsky.

Part two of the company's "birthday party" (Nov. 25, 1958–Feb. 1, 1959) was an ambitious midwinter season, which included the American première of *Medea* (Bartók) by Swedish choreographer Birgit Cullberg; the première of *Octet* (Stravinsky) by William Christensen; the première of *Native Dancers* (Rieti) by Balanchine; and the introduction into the repertoire of Balanchine's monumental lyric theater work, *The Seven Deadly Sins,* first produced in Europe in 1933.

The Seven Deadly Sins, using the spare-framed jazz of Kurt Weill and the mordant verse of Bertolt Brecht, as translated for this production by W. H. Auden and Chester Kallman, was a blend of satire and sentimentality. Balanchine reflected this duality with choreography that had a bite and restlessness unusual for him, and the stage designs of Reuben Ter-Arutunian provided a brilliant evocation of the chrome-plated harshness of the post-World War I era. Personifying the central character, a young girl on the make who is both innocent and crafty, dancer Allegra Kent and *diseuse* Lotte Lenya gave sensitive portrayals of the heroine's dual personality.

The third part of the company's anniversary season (May 12–June 14, 1959) saw the première of the provocative *Episodes,* and the first American performance of the Gagaku, the musicians and dancers of the Japanese Imperial Household. *Episodes,* a two-section work set to miscellaneous orchestral selections by Anton von Webern, was a clever reconciliation of the contrasting esthetic viewpoints of Martha Graham and George Balanchine. In the first section Miss Graham, a modern dance choreographer, illumined with sumptuousness and formality the last hours of Mary, Queen of Scots. In the second section Balanchine created his own personal image of elegance—spare, abstract, measuring the music.

American Ballet Theatre.—The season of the American Ballet Theatre consisted of three weeks in the fall of 1958 at the Metropolitan Opera House and a single summer performance in 1959 at the Lewisohn Stadium, both in New York City. The company's most controversial premières were three ballets by Herbert Ross: the exquisitely sensuous *Paean* (Chausson), the romantic *Concerto* (Tchaikovsky), and the licentious *Tristan* (Wagner). The production of Birgit Cullberg's *Miss Julie,* with music by Swedish composer Ture Rangström, as arranged by Hans Grossmann, underscored the dramatic potential of guest star Violette Verdy, a young French dancer who later joined the New York City Ballet.

Regional Ballet Festivals.—In terms of the future, the most promising events in 1959 were two regional ballet festivals—the Southeastern (April 23–25) in Miami, Fla., and the Northeastern (May 21–24) in Scranton and Wilkes-Barre, Pa. Each of these festivals consisted of companies of adolescent dancers, who, while being nonprofessional in that they do not receive salaries for dancing, are, for the most part, highly professional in motivation. The Southeastern Festival consisted of eight offerings by groups from Miami, Birmingham, Memphis, Atlanta, Nashville, and Jacksonville. The Northeastern Festival drew its 18 ballets from companies in Boston, Ottawa, Scranton, Erie, Wilkes-Barre, Bethlehem, Cleveland, Newark,

PHIL BLOOM; S. HUROK

(*Left*) Jacques D'Amboise and Patricia Wilde in the New York City Ballet's première of *Native Dancers*, a feature of the company's 10th anniversary program during the 1958–59 season. (*Center*) Galina Ulanova, the superb prima ballerina of Moscow's Bolshoi Ballet, which thrilled United States audiences in 1959. (*Right*) The Bayanihan dancers from the Philippines, who also visited the United States in 1959, shown in a dance called *Singkil*. Tapping of long poles in background supplies rhythm. Other dancers from abroad who entertained American audiences were troupes from Africa, Japan, Poland, and Israel.

Woonsocket, Detroit, Philadelphia, Toledo, and Dayton.

Bolshoi Ballet.—As has been the case for almost every year since World War II, a foreign dance company made the greatest impression on the American dance scene. This time it was the Bolshoi Ballet from Moscow, which, after completing its stay at New York's Metropolitan Opera House in April and May 1959, toured major American cities. Like the Soviet Union's Moiseyev Dance Company of the previous year, the Bolshoi won countless American admirers for the Slavic dance temperament.

Although the Bolshoi Company exhibited great vitality, the choreography was literal and conventional, and the décors and costumes were a half-century behind the times. Yet, despite these drawbacks, nobody could fail to be captivated by the touching simplicity of the great ballerina, Galina Ulanova, and by the fiery mime of Vladimir Levashev. In addition, audiences were thrilled by the endless charm and physical daring of such dancers as Yuri Zhdanov, Vladimir Vasiliev, Ekaterina Maximova, Marina Kondratieva, Raissa Struchkova, Alexander Lapauri, Stanislav Vlasov, and Liudmila Bogomolova. Also, there were surprising moments of poetry, principally in traditional works like *Giselle* and *Les Sylphides*.

Ballet Rambert.—A more modest foreign visitor was the Ballet Rambert, of London. This company, long identified as the cradle of experiment in British ballet, made its American debut in a 1959 engagement at the Jacob's Pillow Dance Festival in Lee, Mass. Both in dancing and staging, the Rambert group lacked the expected creative *élan*, although a single work, *Two Brothers* (Dohnányi), by a 23-year-old member of the company, Norman Morrice, indicated a bright hope for the future.

Metropolitan Opera Ballet.—In March 1959, during its first season without a resident choreographer, the Metropolitan Opera sponsored an evening made up entirely of ballet. New works by John Butler, Alexandra Danilova, Antony Tudor, and Herbert Ross were presented. The program, although artistically superficial, did mark an additional rung in the Met's climb toward separate performances for its ballet.

Concert Dance.—Concert dance in the United States—both modern and ethnic—had an active season without offering much of lasting value. Among the foreign visitors was the Beryozka Russian Dance Company, which toured the country after its New York debut in November and December 1958. An all-girl ensemble, the Russian group featured an agreeable though innocuous fusion of ballet and folk dances. Les Ballets Africains, directed by Keita Fodeba, Guinea's minister of the interior, began its month-long American tour on Feb. 2, 1959, in Philadelphia, presenting a stylish if somewhat self-conscious collection of dances and dancers from West Africa. The autumn of 1959 brought two groups from the Orient: the Takarazuka all-girl ensemble from Japan, and the Bayanihan dancers from the Philippines. The first combined Oriental and Occidental styles with great precision, but with an utter lack of taste; the second was a beautiful expression of the composite culture of the Philippines. In November the Polish State Folk Ballet presented a three-week season in New York. The company, known as Slask, numbered 100 spirited dancers and singers, performing for most of the time at breakneck speed. Later that month, Inbal, the Dance Theater of Israel, was seen in a two-week engagement in New York. The company's program was essentially different from that presented during its previous visit two years before. However, audiences which had seen both programs felt that the second was as fine as the first.

In the realm of modern dance, the spring season (May 8–12, 1959) of the Juilliard Dance Theater offered only two items of major importance. These were Valerie Bettis' *The Closed Door* (von Webern) and Doris Humphrey's posthumous *Brandenburg Concerto #4 in G Major* (Bach). Choreography for the latter was completed by Ruth Currier, who collaborated with Miss Humphrey before her death in December 1958. The 12th annual American Dance Festival, at Connecticut College, New London, saw only one important new work: José Limon's *The Apostate* (Krěnek).

Dance Films.—Two films made valuable contributions to the modern dance idiom. Peter Glushanok produced Martha Graham's *Appalachian Spring*, with Miss Graham in the leading role. George Jacobson made a motion picture record of Helen Tamiris in *Negro Spirituals*. The latter, a series of solos that Miss Tamiris had first performed more than 30 years ago, were revived with amazing vitality and immediacy.

(For discussions of the year's dance activities in commercial films, television, and the musical

comedy stage, see, respectively, MOTION PICTURES, RADIO AND TELEVISION, and THEATER.)

DATES. See FRUITS.

DEAFNESS. Recent advances have been made not only in the surgical correction of certain types of deafness, but in the medical treatment of ear disease to prevent deafness, the rehabilitation of deaf children and adults, and the reduction of noise in industry to prevent impairment of the hearing of workers.

The most dramatic results have been obtained in the surgical correction of deafness by means of an operation which again permits sound waves to get to the fluids of the inner ear. Some persons are deaf because of a condition known as otosclerosis, which prevents the movement of the tiniest ear bone, the stapes. One operation, to make an opening directly into the ear canal, produces a new window or fenestra through which the sounds enter. Another, known as the "stapes mobilization" operation, may bring hearing close to normal in certain otosclerosis victims. In this operation the surgeon lifts the eardrum from its position; views the tiny ear bones through an operating microscope; mobilizes the stapes, permitting it to transmit sounds again; and replaces the eardrum.

The use of newer antibiotics has permitted more satisfactory control of ear infections, thus preventing the serious after effects and eardrum destruction that in the past often followed colds, scarlet fever, and other childhood diseases. In those persons with chronic ear infections, such as persistent running ears, many new reconstructive surgical operations have been devised to eradicate infection and restore the hearing to a serviceable level.

Not all hearing loss can be treated by an operation. In many cases the new, tiny, lightweight transistor hearing aids provide immeasurable help. Aids are now being used in many children to bring sound to them so they may learn to speak. Some deafness in infants is the result of German measles (rubella) occurring in the mother during the first three months of pregnancy. Prevention of this and other viral infections may provide the answer to many cases of so-called congenital deafness. Children with this type of severe hearing loss require a long period of patient training, amplification of sound, and education in lip reading.

As man moves rapidly into the jet age, he is faced with new types of noise, including that of the jet engine, which exert their potentially damaging effect on the inner ear. Researchers are learning more of the destructive effects of loud noises, particularly when they are present over a long period of time—in many cases for months and years. New tests to determine those individuals whose ears would be harmfully susceptible to noise are being sought in laboratories throughout the world. In the meantime, efforts are being made in industries to reduce noise and to shield workers from it.

Doctors, audiologists, and engineers are working closely together to prevent deafness in children and adults, and to rehabilitate those who have lost their hearing. The surgical treatment of deafness is advancing so rapidly that many operative procedures have been modified several times. All deafness cannot be cured, but almost all deaf patients can be helped.

BURTON J. SOBOROFF,
Associate Professor of Otolaryngology, University of Illinois College of Medicine.

DEATH, Causes of. The estimated number of deaths in the United States in 1958 was 1,647,000. This resulted in a crude death rate of 9.5 per 1,000 population, slightly lower than the rate for 1957 (9.6) and close to the level of mortality that prevailed for the years 1949–53. In the years 1954–56,

DEATHS AND DEATH RATES FOR SELECTED CAUSES: UNITED STATES, 1957 AND 1958

(Includes only deaths occurring within the continental United States and excludes fetal deaths. Rates per 100,000 estimated midyear population residing in area. Numbers after causes of death are category numbers of the Seventh Revision of the International Lists, 1955.)

Cause of death	Category	Number		Rate	
		1958*	1957	1958*	1957
All causes		1,647,000	1,633,128	950.6	959.0
Tuberculosis, all forms	001–019	12,070	13,324	7.0	7.8

Homicide	E964, E980–E985	7,100	7,641	4.1	4.5
All other causes	Residual	111,610	106,878	64.4	62.8

* Estimates based on a 10% sample of death certificates. The sampling error varies with the number of deaths; for example, the sampling error is 25% for the estimate of 140 deaths from diphtheria, 5% for 3,770 deaths from syphilis, and 0.3% for 633,590 deaths from diseases of heart. (Source: National Office of Vital Statistics, U.S. Public Health Service.)

death rates were the lowest on record, owing in part to the absence of any general outbreak of respiratory disease during this period. The mortality rate for 1958 was affected by the epidemic of influenza that was first reflected in increased mortality for October 1957 and continued through April 1958.

The estimated infant mortality rate in 1958 was 26.9 deaths under 1 year of age per 1,000 live births, more than 2 per cent higher than the rate for 1957 and the second increase in the infant mortality rate since 1936. The maternal mortality rate in 1958 was 3.5 maternal deaths per 10,000 live births.

The chief cause of death among the infectious and respiratory diseases is influenza and pneumonia. The death rate for this cause was 33.1 per 100,000 population in 1958, about 8 per cent lower than that for 1957. Tuberculosis, once the leading cause of death in the United States, has dropped to 15th place. The tuberculosis death rate was 7.0 for 1958, about half the rate five years earlier. The death rate for poliomyelitis in 1958 was 0.1 per 100,000 population, the same as in 1957.

The death rate for motor vehicle accidents in 1958 (22.3 per 100,000 population) was about the same as in 1957 (22.7). For all other accidents the rate was 31.4 per 100,000 population. Among persons aged 1 to 34 years, more deaths resulted from accidents than from any other cause. At ages 15–24 years, the death rate for accidents among males exceeds the rate for females for all causes by nearly a half. (See also ACCIDENTS.)

Of all the persons dying in the United States in 1958, 58% were 65 years or older, and about four fifths of these died from the major cardiovascular-renal diseases or malignant neoplasms.

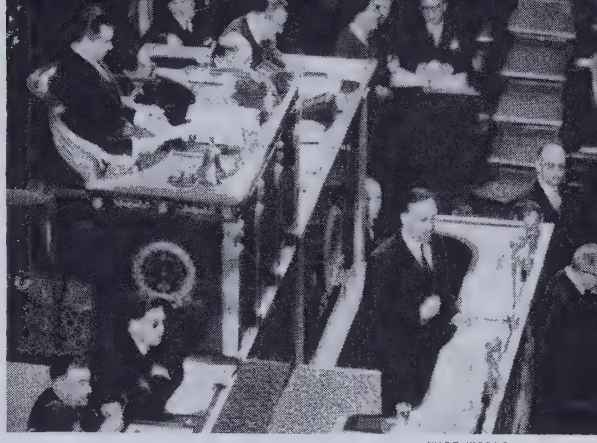
HALBERT L. DUNN,
Chief, National Office of Vital Statistics, U.S. Public Health Service.

DEATHS (OBITUARIES). For a list of prominent persons who died in 1959, see the NECROLOGY at the end of this volume.

DEBRÉ, Michel (Jean Pierre), premier of France: b. Paris, France, Jan. 15, 1912. Brought into Premier de Gaulle's cabinet in June 1958 as minister of justice, Debré was designated first premier of the Fifth Republic on Jan. 8, 1959, when de Gaulle became president.

A lawyer and graduate of the École Libre des Sciences Politiques, he was a deputy delegate to the French Committee of National Liberation during the German occupation of France. After his country's liberation, he held an administrative post in the foreign ministry. He also organized the curriculum of the École Nationale d'Administration, a school for training civil servants and diplomats. In 1948 he was elected to the Council of the Republic (Senate) as a Gaullist.

Though he served as a member of the Council of Europe and of the European Coal and Steel Community, he remained as fervent a nationalist as de Gaulle. He asserted in pamphlets and newspapers, in the Senate, as delegate to the Consultative Assembly of the Council of Europe, and latterly as premier, that France's sovereignty must not be sacrificed to plans for greater European integration. Only a few days after he assumed the premiership, he made it clear that France's participation in various European economic and atomic communities did not presage political integration. Neither he nor President de Gaulle has countenanced outside interference with French policy in Algeria. On June 4 Debré hinted that France might re-examine all of her alliances if there were



WIDE WORLD

French Premier Michel Debré (at rostrum) presents government's program to the National Assembly on January 15.

interference. He and de Gaulle have refused to allow stockpiling of NATO atomic weapons in France. At the same time, they proceeded in 1959 with their plans to hold a nuclear test in the African Sahara as a step toward making France a nuclear power, in spite of a U.N. General Assembly resolution of November 20 requesting France to refrain from making the test.

The Constitution of the Fifth Republic was chiefly the work of Debré, although it is reported that he wanted an even stronger executive. On June 4 the National Assembly upheld the premier's view that it had no right to vote resolutions disapproving government policies unless it was prepared to vote a censure of the government with the intent of forcing it out of office.

(See also FRANCE.)

DEBT, Public and Private. Net public and private debt in the United States totaled $770.2 billion at the end of 1958, a rise of 4.6% during the year, as compared with a 4.1% rise in 1957. (Data for 1958 are preliminary.) The pattern of debt formation in 1958 reflected the business recession and recovery during the year. In the period of downswing early in the year, the cutback in durable goods production and purchases was accompanied by a falling off in corporate and consumer borrowing. In the recovery period, outlays for durable goods advanced, as did the associated forms of debt.

PUBLIC AND PRIVATE DEBT IN THE U.S., END OF CALENDAR YEARS 1957 AND 1958[1]

[1] Data for state and local governments are for June 30 of each year. Components may not add to totals because of rounding. [2] Includes categories of debt not subject to statutory debt limit. [3] Long-term debt is defined as having an original maturity of 1 year or more from date of issue; short-term debt as having an original maturity of less than 1 year. [4] Comprises debt of farmers and farm cooperatives to institutional lenders and federal government lending agencies, and farm mortgage debt owed to individuals and others. [5] Data for noncorporate borrowers only. [6] Comprises debt incurred for commercial (nonfarm), financial, and consumer purposes, including debt owed by farmers for financial and consumer purposes. (Source: *Survey of Current Business*, May 1959, U.S. Department of Commerce.)

In the public sphere, the total net debt of all levels of government rose by $12.4 billion ($3 billion in 1957). The $8.3 billion advance in the federal debt (the largest increase in the postwar period) resulted from a rise in expenditures and a decline in tax receipts. The expenditure rise was mainly in the form of personal transfer payments, agricultural price support, and grants-in-aid under the highway program.

In the private sphere, net corporate debt rose by only $3 billion, as compared with $12.2 billion in 1957. The substantial increase in long-term indebtedness in 1958 was largely a result of the extensive refinancing of short-term bank debt into longer maturities during the period of low interest rates early in the year. The net total of $18.7 billion in new obligations incurred by individuals and unincorporated enterprises was $5 billion more than in 1957. The chief factor in this rise was the expansion in mortgage debt by nearly 10%, reflecting a sharp increase in residential construction and an upsurge in sales of existing homes. DE GAULLE, Charles André Joseph Marie, president of France: b. Lille, France, Nov. 22, 1890. In his first full year as president of the Fifth Republic, de Gaulle succeeded in restoring domestic stability, both political and economic, and in elevating national morale to a postwar high, but he failed to make any appreciable progress toward ending the five-year Algerian rebellion. Under his guidance, the French Community seemed to be evolving into an association of states constructed on the commonwealth pattern, with growing prospects of sovereignty for the individual members. On the international scene, de Gaulle's insistence on a larger role for France in mapping Western strategy, and on reduced integration of French armed forces within the North Atlantic Treaty Organization (q.v.), caused some consternation and embarrassment among Allied governments.

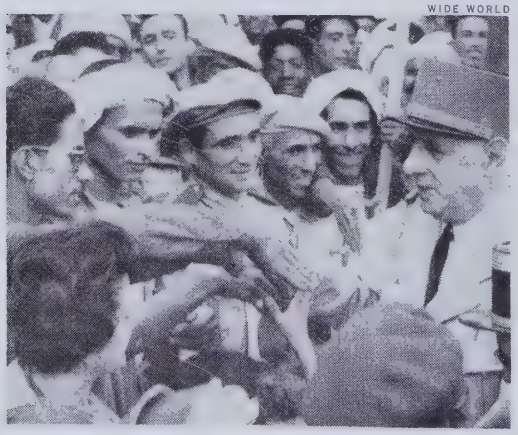
In the decades preceding World War II, de Gaulle became an authority on mechanized warfare, and in June 1940 was appointed undersecretary for war and national defense. After the fall of France, he became leader of the Free French resistance movement, and on June 2, 1943, organized and assumed the direction of the French Committee for National Liberation. When the Allies recaptured Paris, the general returned to the city on Aug. 25, 1944, and five days later he became head of the provisional government of the French Republic. Resigning on Jan. 20, 1946, he remained in the background until the threat of civil war in May 1958 brought his return to power. The National Assembly endorsed him as premier on June 1; his new constitution creating the Fifth Republic was promulgated on October 4; and on December 21 he was formally elected president, succeeding René Coty of the Fourth Republic.

French President de Gaulle, wearing general's uniform, shakes hands with well-wishing villagers in Saida, Algeria, on August 27 as he begins a four-day tour of the country.

WIDE WORLD



Sworn in on Jan. 8, 1959, for a seven-year term, President de Gaulle directed his attention again to finding a solution to the vexatious problem of Algeria. On January 15 he repeated his 1958 peace bid to the Algerian rebel leaders, inviting them to Paris to negotiate a cease-fire, and on September 16, in a radio-television address to France and Algeria, he proposed that the people of Algeria, in free elections, decide their own future. He offered them three choices: (1) independence; (2) integration with France in a full provincial status; and (3) autonomy. The latter, to which de Gaulle gave strong support, would provide for a "government of Algeria by the Algerians," acting in close association with France on such matters as foreign relations, economy, defense, and education. He predicated his plan on one important condition: that the balloting to determine Algeria's future take place only after (but not more than four years after) the cessation of hostilities. (See also ALGERIA.)

De Gaulle's attitude toward the NATO defense system posed a major threat to the continuance of that organization as presently constituted. NATO leaders learned on March 11 that de Gaulle was removing part of France's Mediterranean fleet from unified control in wartime, because, as he said on March 25, the NATO defense perimeter did not include North Africa. In June it was announced that 200 NATO fighter-bombers were being shifted from French airbases as a result of demands by Paris for greater control over nuclear arms on its soil, contrary to United States policy. And on November 3, de Gaulle spoke bluntly on the question of France's military role vis-à-vis unified Western defense, declaring, "The system of integration which prevailed during a certain epoch has had its day." He said that France would administer its own defenses and that it would acquire its own missile and nuclear arsenal. In these moves, observers saw evidence of de Gaulle's determination that France be given full partnership with the United States and Britain in formulating Western military and political policies on a worldwide basis —a view unacceptable to the other allies.

De Gaulle reached close accord with West German Chancellor Adenauer in 1959 on cold war issues, often to the dismay of Britain, which favored a more flexible approach to Berlin and other East-West contentions. In a meeting near Paris on March 4, the French and West German leaders agreed that negotiations with the Soviet Union should involve no revision of the Berlin status; and in discussions with British Prime Minister Macmillan on March 9–10, de Gaulle rejected consideration of a military disengagement in central Europe or of any plan for a neutralized Germany.

De Gaulle met with President Eisenhower in Paris on September 2–3, when they reportedly exchanged frank views on policy differences between the two nations. These conflicts were further discussed at the Western summit meeting in Paris on December 19–21. On the question of a Big Four summit parley, the French president had opposed an early conference (in the fall of 1959), and on this point he prevailed over his two major allies. (See also SUMMIT CONFERENCE.)

De Gaulle's travels abroad in 1959 included a state visit to Italy, on June 23–27, and three visits to Africa: a nine-day tour of French Somaliland

and the Malgache Republic (Madagascar) in July; a tour of Algeria on August 27–30; and another of Senegal, where he presided over a meeting of the Community's Executive Council in Saint-Louis on December 11–12. There and at Dakar, which is to be the capital of the new Mali Federation (q.v.), he made his most specific statements concerning French intentions to aid in the accession to sovereignty of the former possessions.

DELAWARE. Middle Atlantic state, United States; one of the original 13 states. The "Diamond State" ranks 49th in area and 46th in population among the 50 states.

Area and Population.—Area: 2,057 square miles (land, 1,978; inland water, 79), divided into Kent, Sussex, and New Castle counties. Population: (1950) 318,085; (est., July 1, 1958) 444,000. Urban places with 1950 populations above 5,000 are: Dover, *the capital*, 6,223; Elsmere, 5,314; Milford, 5,179; Newark, 6,731; New Castle, 5,396; and Wilmington, 110,356.

Executive.—Chief state officers in 1959:
Governor: J. Caleb Boggs (Republican)
Lieutenant Governor: David P. Buckson
Secretary of State: George J. Schulz
Treasurer: Belle Everett
Attorney General: Januar D. Bove, Jr.
Auditor: Ernest E. Killen
Supt. of Public Instruction: George R. Miller, Jr.

Constitution and Judiciary.—The present constitution went into effect in 1897. The Supreme Court comprises three justices; chief justice in 1959 was Clarence A. Southerland.

Legislature.—The General Assembly (Senate, 17 members; House of Representatives, 35) convenes in odd-numbered years, commencing the first Tuesday in January, but in 1961 a new constitutional amendment requiring annual sessions will go into effect. Sessions in odd-numbered years will begin as before, but in even-numbered years the General Assembly will convene on the first Tuesday in February.

A second constitutional amendment adopted in 1959 raised all assemblymen's annual salaries from $1,000 to $3,000, and many other salaries were raised by statute. After passing supplementary appropriations of over $2.5 million for the fiscal year ending June 30, 1959, the legislature passed an appropriation bill of $66.5 million for the next year and soon supplemented this with funds of more than $15 million, including almost $14 million for road construction to be raised by the sale of bonds. Excepting the Wilmington Board of Education, all local school boards were made elective, although provision was made for the holding of local referenda on the subject wherever a sufficient demand was expressed for appointed school boards. The legislators revised the election departments of Kent and Sussex counties and approved a procedure for the establishment of park districts in the northern end of the state. Wilmington was granted permission to float bonds for city improvements and to move the existing curb markets into a new market house, for which provision was made. Among miscellaneous legislation, a new Boat Registration and Safety Law was passed, and another statute created a Delaware Citizens' Council on Aging.

Finance.—In the 1958–59 fiscal year, state revenue of $173,520,455 comprised $68,112,144 from state tax sources, $23,427,792 from the federal government, and $81,980,519 from all other sources. Tax revenue consisted of $27,509,307 from individual income taxes, $5,162,630 from corporate income taxes, $8,125,175 from motor fuel taxes, $1,846,885 from licensing, and $25,468,147 from all other state tax sources. Expenditures of $181,299,913 comprised $73,581,105 for education, $18,100,697 for health, welfare, and safety, $33,858,045 for highways, and $55,760,066 for all other purposes. State long-term indebtedness on June 30, 1959, amounted to $166,018,000.

Banking.—As of June 10, 1959, the state's 4 national banks had assets of $11,934,000 and, on June 30, 1959, the 20 state banks and their 53 branches had $856,302,602.59 in assets.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $27,842,085 ($436 per pupil), comprising $3,084,336 from local school districts, $24,191,545 from the state, and $566,204 from the federal government. Outlays for construction and improvements amounted to $21,560,153, and teachers' salaries (1958–59) averaged $5,475 (high school, $5,732; elementary, $5,259).

DELAWARE SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (1–8)	146	1,750	43,897
Public junior high (7–9)	43	...[1]	17,523
Public senior high (10–12)	35	1,463	12,131
Private and parochial elementary and secondary	50	...	17,339
Colleges and universities	4	...	6,865

[1] Included in public senior high figure.

Social Welfare.—In the fiscal year 1958–59, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $4,519,709, including $880,678 for the aged, $1,754,705 for dependent children, and $1,415,729 for general relief. A monthly average of 12,590 persons received assistance.

Labor Force.—The state's labor force totaled 190,600 on July 15, 1959, including 15,000 agricultural workers. Nonagricultural employment was up to 153,200 from 149,200 on the previous July 15, and also above the 149,000 average for the intervening 12 months. Of the nonfarm total, 39.6% were employed in manufacturing, 18.3% in trade, and 11.2% in service industries. Unemployment stood at 6,400 on July 15, 1959, well below the 9,600 reported for the previous July 15. The state paid $8,173,848 in unemployment compensation claims during the year ending June 30, 1959.

Manufacturing.—Delaware's 56,643 persons employed in manufacturing in 1957 received $307,424,000 in wages. Value added by manufacture totaled $497,717,000, and outlays for new plant and equipment amounted to $58,976,000. The principal manufacture is that of chemicals and chemical products, which in 1957 employed 5,351 persons who received $29,952,000 in wages, and which added $109,061,000 in value by manufacture. Other important industries are food processing, apparel and related products, and primary metals. Production workers in manufacturing averaged $87.02 for an average workweek of 40.1 hours in August 1959.

Mining.—Delaware had the smallest mineral output of any state in the Union in 1958, representing 0.01% of the national total. The 1958 value was $1,142,000, of which $962,000 was received for 1,090,000 short tons of sand and gravel.

Fisheries.—The commercial fish and shellfish catch in 1958 amounted to 276,538,000 pounds valued at $5,974,000. Principal species were menhaden (269,667,000 pounds valued at $3,776,000) and oysters (2,410,000; $1,717,000).

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $72,290.000 from $83,747,000 for the same period of 1958. For the full year 1958, income comprised $83,789,000 from livestock and livestock products, $31,250,000 from crops, and $1,859,000 from government payments. Principal income sources in 1958 were: broilers, $62,676,000; dairy products, $9,452,000; and corn, $7,742,000.

The 6,200 farms in the state (1958) had a total acreage (1954) of 814,000 (412,000 acres in harvested cropland). Livestock on farms (Jan. 1, 1959) included 65,000 cattle and 773.000 chickens (excluding commercial broilers). There were

DELAWARE CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	322	280	360
Corn (1,000 bu.)	6,760	8,580	9,075
Potatoes (1,000 cwt.)	1,033[1]	2,310	2,400
Soybeans (1,000 bu.)	1,529	3,622	3,442
Wheat (1,000 bu.)	972	714	742

[1] Average, 1949–57. (Source: U.S. Department of Agriculture.)

13,716 family and hired workers engaged in farming during the week of Oct. 24–30, 1954.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $25,629,755, and new construction and improvements completed in the 1958 calendar years aggregated 464.4 miles, including bituminous surfacing of dirt roads.

Highways and roads totaled 4,125.5 miles on July 1, 1959 (3,813.6 miles surfaced). Registered *motor vehicles* numbered 177,471 on the same date, including 125,909 passenger cars. There were (1959) 3 *railroads* operating 841 line miles; 2 regularly scheduled *airlines;* and 13 *airports and airfields* (8 commercial and municipal, 1 military, 3 private, and 1 restricted).

Communications media (1959) included 8 AM and 3 FM *radio stations;* (1958) 3 daily *newspapers* (circulation, 111,186) and 17 other newspapers (45,741); and (Jan. 1, 1959) 57,200 business and 141,200 residential *telephones.*

Principal Events, 1959.—The problem of racial integration in the Delaware public schools approached a peaceful solution in 1959 when U.S. District Court Judge Caleb R. Layton, III, on April 24 approved the State Board of Education plan for gradual desegregation. This plan, which calls for grade-by-grade integration over 12 years, was quietly put into effect in September by the admission of a few Negroes to the first grade in seven hitherto-segregated schools in Kent and Sussex counties, where, except in Dover, no public schools had previously been successfully desegregated. Milford, scene of an anti-integration riot in 1954, was one of the towns where the new plan was peacefully put into operation.

Most Negro students are now in schools that either are entirely integrated racially or are in the process of being desegregated. It was probably with this in mind that the Delaware Civil Rights Advisory Committee reported to the federal Civil Rights Commission that the poor housing available for Negroes is the most obvious of all racial discriminations in Delaware. Of 7,000 dwelling units judged to be dilapidated, approximately 5,500 units were occupied by Negroes. Except for the racially integrated developments opened by the Wilmington Housing Authority, little new housing is available to Negroes. When a Negro family named Rayfield moved into Collins Park, a Wilmington suburb, white neighbors protested vigorously outside the Negro-occupied house and before the home of the realtor who sold the property. Police protected the Rayfield house for a time, but weeks after the mobs disappeared the house was twice damaged by bombings, which occurred when no one was at home. Police seized suspects, but the Rayfields moved back to Wilmington.

Democratic control of the legislature was so strong that excepting bills creating a debt, which require a three-fourths majority, any legislation could be passed on a party vote, even if the Republican governor chose to exercise his veto power. The state constitution was amended to provide for annual sessions of the legislature, and though this provision was not to go into effect until 1961, the legislature departed from past precedent by making appropriations for only one year instead of two. Although appropriations seemed likely to exceed revenue and thereby to increase the already large state debt, and although the total of state and local taxes was very low in proportion to income, no new revenue measures were adopted. (See also above, *Legislature.*)

Economists noted the likelihood that additional satellite factories, like that of the Motor Wheel Corporation at Newark, would be established near the automobile assembly plants and the Tidewater refinery, and that Delaware's strategic location in reference to Eastern population centers would draw more distributing facilities, like the established General Foods and the projected Ginn and Company warehouses. The Pusey and Jones Corporation, an old Wilmington shipbuilding and machine manufacturing firm, closed in November and was placed in the hands of receivers.

DE MILLE, Cecil Blount (77), American motion picture producer and director: b. Ashfield, Mass., Aug. 12, 1881; d. Hollywood, Calif., Jan. 21, 1959. To speak of motion picture extravaganzas—lavish, opulent, costly—is to speak of Cecil B. de Mille, one of the legendary moguls of filmdom. Catering to the public's penchant for spectacular screen fare, de Mille was responsible for a number of Hollywood's most successful films, which, if not always paragons of good taste, were box-office favorites. Among his big money-makers were a number of pictures with Biblical themes: *The Ten Commandments* (1923; remake, 1956), *The King of Kings* (1927), *The Sign of the Cross* (1932), and *Samson and Delilah* (1949).

UPI

Cecil B. de Mille (1881–1959)

Cecil B. de Mille was the son of Henry Churchill de Mille (1853–93), a popular playwright of the last decades of the 19th century; the brother of William Churchill de Mille (1878–1955), also a playwright and, after 1914, a motion picture director; and the uncle of Agnes de Mille, dancer and choreographer. After attending New York's American Academy of Dramatic Arts, from which he was graduated in 1900, he was connected with the Broadway stage, first as an actor and later as a play broker and playwright.

In 1913, joining Jesse L. Lasky (1880–1958) and Samuel Goldfish (later Goldwyn) in founding the Jesse L. Lasky Feature Play Company, he went to Hollywood, where he directed *The Squaw Man,* his first film and one of the pioneer feature-length motion pictures. Between 1914 and 1924, the year he founded his own company, his productions included *The Virginian* (1914), *Rose of the Rancho* (1914), *The Girl of the Golden West* (1914), *The Trail of the Lonesome Pine* (1916), *Male and Female* (1919), and *The Affairs of Anatol* (1921). In 1928 he joined Metro-Goldwyn-Mayer, returning in 1932 to the Lasky organization (by then Paramount Pictures Corporation) as an independent producer. His first sound film, *The Sign of the Cross,* appeared in that year. Later films of note were *Cleopatra* (1934), *The Crusades* (1935), *The Plainsman* (1936), and *Union Pacific* (1939).

During his 45 years as a Hollywood showman, de Mille was responsible for 70 films, a number of which bore the stamp of bigness and were remarkably successful at the box office. For example,

the second version of *The Ten Commandments*, produced for about $13 million and for which 25,000 extras were used in shooting the scene of the Exodus of the Israelites from Egypt, was reported to have grossed $60 million by the fall of 1958. (The total receipts for all his films is estimated at $750 million.) In spite of their vast cost and overwhelming popularity, few de Mille productions were regarded as artistic milestones, and only one, *The Greatest Show on Earth* (1952), received an award of the Academy of Motion Picture Arts and Sciences.

The Autobiography of Cecil B. De Mille, on which he had been working, was posthumously published, as edited by Donald Hayne.

DEMOCRATIC PARTY. Basically united in their desire to prepare for and win the presidential election of 1960, and generally encouraged by political omens from scattered elections in 1959 (see ELECTIONS, U.S.), leaders of the Democratic Party were nevertheless divided over issues of policy and strategy. Differences were deep-rooted between North and South on issues of civil rights and also between moderates and liberals in economic policy.

The heavily Democratic 86th Congress (opening with divisions of 64–34 in the Senate and 283–153 in the House—with Hawaii on July 28 choosing one senator from each major party but electing an additional Democrat to the House) was guided in a relatively moderate program by Senate Majority Leader Lyndon B. Johnson and House Speaker Sam Rayburn, both of Texas. Senator Johnson, summarizing the session on September 14, called it "solid and substantial."

Chairman Paul M. Butler of the Democratic National Committee had urged a more liberal program, supported by a majority of the National Committee, the Democratic Advisory Council, and probably by a majority of state party chairmen. "Let us Democrats not be deterred by threat of presidential veto from providing that positive legislative action so essential to our security and well-being," Butler said on May 24 in opposing administration emphasis on "a balanced fiscal budget." Liberal opinion of the party, in and out of Congress, supported greater national investment in defense, education, housing, slum clearance, health, social security, conservation of natural resources, and aid for the free-world economy. Liberals also advocated policies favoring growth of the national product at a yearly rate of 5%, control of inflation through full employment and competitive pricing, and federal enforcement of civil rights. Senator Johnson held to the position that, with Congress and the presidency divided between the two parties, the choice was one "of doing something or doing nothing—of creating laws or creating issues."

The Democratic Advisory Council, meeting in New York on December 5–7, proposed on the first day that the 1960 party platform contain planks for (1) a National Peace Agency to help solve world problems of disarmament and overpopulation and (2) effective price stabilization and disapproval of high interest rates. On December 6 the council issued a 10,000-word blueprint for a platform indicting the Republican administration for its economic policies and advocating stronger federal programs in such areas as education, civil rights, health, housing, and natural resources, and recommending increases of 30% in social security benefits and a minimum hourly wage of $1.25. Four United States senators were actively receptive candidates for the presidency: John F. Kennedy, Massachusetts; Hubert H. Humphrey, Minnesota; Stuart Symington, Missouri; and Lyndon Johnson (qq.v.) of Texas. Adlai E. Stevenson (q.v.) remained aloof from politics but was much discussed as a candidate. Gov. Edmund G. (Pat) Brown (q.v.) was favored by many Californians as a favorite son.

WIDE WORLD

Adlai Stevenson (right), twice the Democratic presidential nominee, talks to National Chairman Paul M. Butler (left) and former Secretary of State Dean Acheson, at meeting of the Democratic Advisory Council in Washington on June 13.

The National Committee voted 71–35 on February 27 to convene the 1960 Democratic National Convention in Los Angeles on July 11, partly because of a pledge of $350,000 made by leaders from that city. Appeals from Chicago and Philadelphia were rejected. On September 16 the National Committee readopted the 1956 "loyalty rule" requiring delegates from each state to strive for election ballot space for the name of the convention nominee. At the same time, rules for apportioning convention votes were revised to provide that: (1) no state have fewer than in 1956; (2) 2½ votes be assigned every state for each of its seats in either house of Congress, any fraction in the total being raised to the next number; (3) each member of the National Committee be given a half vote, with other individual delegates given full or half votes at state discretion; and (4) one alternate delegate be permitted for each full vote. The total convention vote was therefore to be 1,521, with a majority (761) required for nomination. The new rules made only minor changes in regional voting strength but slightly reduced the proportionate power of large states.

The National, Congressional, and Senatorial committees announced total expenditures of $1,268,734 in 1958 Democratic campaigns, against receipts of $1,239,480. The National Committee had carried a deficit of $750,000 from the 1956 campaign, and in 1959 a 750 Club was organized to pay the debt through $1,000 pledges. By October 6, $354,382.50 had been pledged or paid. The committee was hard pressed for current expenses in 1959. On November 7 Chairman Butler reported that 30 states and territories had paid nothing toward 1959 quotas and declared that 1960 convention delegations would be seated and housed in accordance with state financial performance.

FRANKLIN L. BURDETTE,
Professor and Director, Bureau of Governmental Research, University of Maryland.

DENMARK. The Kingdom of Denmark consists of the peninsula of Jutland (Jylland) and 496 adjacent islands (109 inhabited), of which the largest are Zealand (Sjaelland), Fyn, Lolland, Falster, and Bornholm. The Faeroe (Faroe) Islands, in the At-

lantic between Scotland and Iceland, and Greenland, a former dependency, are integral parts of the kingdom, although both have some political autonomy. Denmark proper borders on Germany to the south and is separated from Norway to the north by the sea channel of the Skagerrak, and from Sweden to the east by the Kattegat and the Øresund. Excluding the Faeroe Islands and Greenland, the area of the kingdom is 16,619 square miles, and the population (est. 1959) is 4,552,200. The principal cities and their 1959 populations are Copenhagen (København), the capital, 942,058 (Greater Copenhagen, 1,246,969); Aarhus, 118,205; Odense, 109,136; and Aalborg, 85,318.

Government.—Denmark is a constitutional monarchy, ruled under a parliamentary system since 1901. King Frederik IX (b. 1899; acceded 1947) is chief of state, acting through a cabinet responsible to the Folketing, which has been a unicameral body since the adoption of a revised constitution in 1953. This same revision permits the king's eldest daughter, Princess Margrethe, to succeed her father. The Folketing elected on May 14, 1957, consists of 70 Social Democrats, 45 Moderate Liberals (Left), 30 Conservatives, 14 Social Liberals (Radical Left), 9 Single Taxers, 5 Communists, 1 member of the Socialist People's Party, 2 representatives each from Greenland and the Faeroe Islands, and 1 from the German minority. Since May 28, 1957, Premier Hans Christian Hansen, a Social Democrat, has headed a coalition government of 9 Social Democrats, 4 Social Liberals, and 3 Single Taxers, giving the government an absolute majority of the Folketing's 179 members.

Religion.—The Evangelical Lutheran Church, of which over 98% of the people are members, is the state church, but other religions (aggregating about 70,000 members) enjoy complete freedom.

Education.—Since 1814 education for all children between the ages of 7 and 14 has been required by law. A school law enacted in 1959 provides for the elimination of one stage in the process, an aptitude examination at the fifth grade, a voluntary continuation of schooling after the seventh grade, and examinations for admission to the upper secondary schools. In January 1959 there were 3,726 primary and secondary schools with 664,240 students, 405 technical schools with 53,445 students, and 29 agricultural schools with 2,928 students. The universities of Copenhagen (founded in 1479) and Aarhus (opened in 1933) had enrollments of 4,783 and 1,878, respectively. The world-famous folk high schools, numbering 62, had a combined enrollment of 6,478.

Social Welfare.—Since the beginning of the 20th century the Danish government has assumed an ever-increasing responsibility for its citizens. Social insurance is obligatory for low-income groups, and payments are made by all employed persons. In addition, subventions are made through private associations. The insurance system covers sickness, old-age pensions, disability, unemployment, and workmen's compensation.

Free medical assistance and hospitalization are provided for 80% of the population, and pensions, starting at the age of 67, are graduated according to individual income resources. Low-income families living in subsidized housing are entitled to allowances of 20 to 75% of the rent. Mothers are given housekeeper services for vacations and illnesses. In 1958–59 public expenditures for health and welfare amounted to more than 1.8 billion kroner (1 krone = U.S.$0.1448).

Finance.—The national budget for the fiscal year 1959–60 anticipated income of 6.02 billion kroner and expenditures of 5.5 billion. The chief sources of revenue were excise and customs taxes (3.4 billion kroner), personal and property taxes (2.1 billion), and corporate income taxes (0.4 billion). The main expenditures were for social and welfare purposes (2.1 billion kroner), other civil purposes (1.8 billion), military and defense purposes (0.9 billion), and investment (0.7 billion). The gross national product in 1958 totaled 33.5 billion kroner, or about 4% more than in 1957. The cost-of-living index (1953 = 100) was 117.

Transportation and Communications.—The Danish merchant marine, which aggregated 2,051,162 gross registered tons at the beginning of 1958, plies all the waters of the world and is a vital source of foreign exchange. During the year, however, income from this source declined by about 250 million kroner. Railroads are still the most important means of domestic transport and are being modernized by the purchase of diesel locomotives, efficient business methods, and improved freight handling. The rail network, including an extensive fleet of train ferries, is 2,880 miles long. For the 550,000 motor vehicles registered in 1959 there were 5,217 miles of main highways and 28,644 miles of byroads. The major airline connecting Denmark with foreign countries is the Scandinavian Airlines System, in which Danish Air Lines is a partner. Kastrup Airport at Copenhagen is now equipped to handle jet flights over the North Pole. As of 1959, Denmark had more than 1,116,000 telephones, 1,290,000 radios, and 280,000 television sets.

Production.—Some 27.1% of the Danish people derive their livelihood from agriculture, 30.7% from industry and handicrafts, 8% from construction and transportation, 13% from commerce and distribution, 9% from the professions and government, and 12% from investments and pensions. Agricultural products account for more than half of Denmark's export earnings. In 1958 the output of milk reached 11,292 million pounds, 8,342 million of which were used to make 348 million pounds of butter (251.8 million pounds exported) and 236 million pounds of cheese (161.1 million pounds exported). Other major exports are eggs (2,456 million produced in 1958) and meat (903.9 million pounds exported). Crop production in 1958, in thousands of bushels, included barley (114,180), oats (44,850), rye (12,000), apples (11,968), and wheat (10,100). In addition, 26,400,000 metric tons of root crops and 194,000 tons of hay and fodder were produced. A smaller harvest because of drought cut agricultural exports in 1959, but higher prices reduced the loss to Danish farmers.

Without natural resources except for clay, stone, and salt, Denmark must import her fuels, metals, and forest raw materials. Decreases in prices of these commodities in 1959 raised the earnings from such manufactures as plywood, furniture, pulp, merchant ships, cement, electric motors, machine tools, and heavy machinery. The industrial production index (1955 = 100) rose from an average of 109 in 1958 to 119.5 by May 1959, with the stone, clay, and glass industries showing the largest increase. In the same month unemployment declined to an all-time low of 2.7% of the insured workers.

In 1958, Denmark produced 3,528 million kw.-hr. of electric power. A new 135,000-kw. plant went into operation at Asnaes in June 1959. Meanwhile, a loan of $40 million for the expansion of power plants and transmission lines was arranged through the International Bank for Reconstruction and Development and the sale of Danish bonds in New York.

The favorable position of the Danish economy has been enhanced by tourist income, which totaled 552 million kroner in 1958 and was expected to exceed this figure in 1959. Growing interest in the Scandinavian countries, combined with improved air transport and hotel facilities, has made tourism a major business in Denmark.

Foreign Trade.—Exports in 1958 totaled 8,596 million kroner, and imports 9,252 million, the imbalance being corrected by loans and earnings on investments. In the first half of 1959 exports amounted to 4,468 million kroner, or 176 million more than in the same period of 1958; imports rose even higher, to 5,166 million, as compared with 4,436 million in the earlier period. Great Britain and West Germany continued to be Denmark's chief customers. As of June 30, 1959, Danish holdings in gold and foreign exchange totaled $255 million.

Principal Events, 1959.—Debate on Danish membership in the proposed free trade area of the Outer Seven continued in the Folketing throughout the year. Inclusion of agricultural goods was the main stumbling block, although Denmark also feared being put in an unfavorable position between Great Britain of the Outer Seven and West Germany of the European Economic Community (q.v.). While the Folketing voted to continue negotiations, 77 members abstained. Eventually, on November 20, the Outer Seven countries initialed a treaty forming the European Free Trade Association (q.v.).

A two-year trade agreement was signed with

the USSR in May, and a visit to Denmark, Norway, and Sweden by Premier Nikita S. Khrushchev was scheduled for August. On July 20, the premier canceled his trip, alleging unfriendliness on the part of the Scandinavian peoples and press. There were no further repercussions, however, and when Nike missiles were delivered to Denmark in August, expected Communist demonstrations did not materialize.

Danish obligations to the North Atlantic Treaty Organization (NATO) came under discussion when the government reduced the term of military service from 16 to 14 months and formulated a defense budget that fell short of NATO standards. Meanwhile, negotiations with West Germany on the joint construction of ammunition depots in Jutland were halted.

Municipal elections showed a decline in Social Democratic strength even while the coalition government's popular support increased. In the Faeroe Islands the Social Democrats gained a slight advantage at the polls. Both the Faeroe and the Danish legislatures ratified a new fishing agreement with Britain.

Premier Hansen visited the United States on March 24–31. In September, Dr. Albert Schweitzer visited Denmark to receive the Sonning Prize for his humanitarian work in Africa.

RAYMOND E. LINDGREN,
Chairman, Department of History, Occidental College.

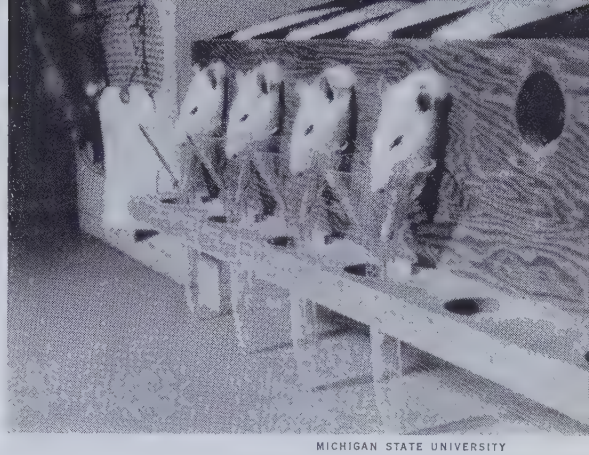
DENTISTRY. Dental Profession.—In August 1959 the dental profession closed its first century of activity as a health service. While dentistry as a branch of the healing arts has been practiced since the dawn of recorded history, its recognition as a truly basic health service was indeed slow. The occasion was marked by a great centennial celebration held in New York City during the week of Sept. 14–18, 1959. The meeting was attended by more than 25,000 dentists, physicians, educators, government representatives, and guests from more than 30 countries.

Most of the scientific programs and exhibits of the New York meeting were held at the Coliseum. A vast number (about 800) of essays, papers, clinics, films, and lectures covering a wide range of dental subjects were presented. The centennial banquet was held in the main ballroom of the Waldorf-Astoria Hotel, despite the fact that the mayor of the city had sought to obtain the ballroom on the same date for a luncheon tendered Premier Nikita Khrushchev of the USSR, who was visiting the United States at that time.

The Post Office Department issued for the first time in 1959 a special commemorative stamp marking the 100th anniversary of the American Dental Association. The association held its first meeting on Aug. 3–4, 1859 at Niagara Falls, N.Y., and its first publication appeared in September 1913. This publication preceded the present *Journal of the American Dental Association*, which in 1958 had a circulation of 100,000.

The first regular dental school in the United States was the Baltimore College of Dental Surgery, established in 1840. In 1959 there were 47 schools of dentistry in the United States, and 34 schools of dental hygiene. As late as 1800 there were only about 100 dentists in the United States. During the next half-century the number increased to about 4,000, and by 1959 the American Dental Association had a membership roll of over 95,000.

Operating Technic.—The recent announcement by a major manufacturer of hospital and medical supplies, that it is developing a new type of pain eliminator, holds promise of a very welcome nature.



MICHIGAN STATE UNIVERSITY

Saliva samples are taken from white rats in a Michigan State University research project into the causes of tooth decay. Saliva is believed to be a contributing factor.

Called an "audio-analgesic," the instrument emits sound waves of a special amplitude which, reaching the patient through a pair of high-fidelity earphones, are capable of blocking out pain. Intended primarily for dental use, it has proved 90% effective in thousands of test cases.

Public Health.—On June 12–13, 1959, the first national conference of the Joint Council to Improve the Health Care of the Aged was held in Washington, D.C. The joint council is sponsored by the American Medical Association, the American Dental Association, and the American Nursing Home Association. Its major purpose is to correlate the efforts of all branches of the healing profession to enable them to cope more adequately with the fast-growing geriatric problem. There are in the United States at the present time over 15 million persons over age 65, and approximately a million more are added every three years. (See OLD AGE.) As the elderly population increases, the dental health problem increases enormously and disproportionately. Dentistry will find itself faced with a gigantic geriatric problem unless researchers can find ways of preventing dental disease and preserving the natural human dentition. These facts point up the urgent need to implement the recommendations which the American Dental Association has recently made to the Senate Subcommittee on Problems of the Aged, and which it hopes to make to the White House Conference on Aging, to be held in January 1961. Research and advance planning are foremost among these recommendations.

The U.S. Public Health Service has recently issued a report which indicates that the water supplies of 1,903 cities and towns in the United States, with a combined population of 7 million, contain 0.7 parts or more per million of fluoride. Eighteen hundred communities now use artificially fluoridated water, reaching a population of approximately 35 million people. The report shows that one out of every three persons consuming water from communal water supplies is now drinking water which is naturally or artificially fluoridated. (See also NUTRITION.)

During the past year the Academy of Dentistry in Toronto, Ontario, has inaugurated and maintained a new dental health service, which it calls "After Hours Emergency Service." Through a listing in the telephone directory and by the use of a telephone answering service, patients in distress are able to receive help daily during the hours of 7 P.M. to 6 A.M. and all day on Sundays and holidays. The academy has a roster of dentists who serve voluntarily on a rotating basis. The fact that as many as a dozen people have been helped in a single night in Toronto, a city of approximately

700,000 people, attests to the need for and the value of the emergency service.

DERMATOLOGY. Griseofulvin.—An antibiotic given by mouth and effective against a wide variety of pathogenic fungi, griseofulvin was made available in the United States in 1959—the outstanding dermatological advance of the year.[1]

Clinical reports by numerous authors, including Harvey Blank and Frank J. Roth, Jr., and Harry M. Robinson, have shown that a dose in adults of not more than 2.0 grams per day eliminates infections with *Microsporum canis, M. gypseum, M. audouini, Epidermophyton floccosum, Trichophyton mentagrophytes, T. tonsurans, T. rubrum,* and some other pathogens, even when an infection has been of long standing. Since these are the organisms causing a large majority of the cases of "ringworm" of the skin, hair, and nails, the value of the drug is apparent. It has revolutionized the treatment of fungus diseases, rendering obsolete X-ray epilation in tinea of the scalp and avulsion of nails in onychomycosis; and it makes possible the ready cure of such stubborn, or hitherto actually incurable, diseases as "black dot ringworm" of the scalp in adults, due to *T. tonsurans,* and *T. rubrum* infections of the nails.

The mode of action of griseofulvin involves its entrance into epidermal tissues after oral administration, rendering the epithelium invulnerable to fungus infection. Since epithelium proliferates while pathogens can no longer invade it, infected epithelium of the skin soon exfoliates and that of the hair or nails grows out and is cast off or removed by simple débridement. The duration of treatment depends on the time necessary for replacement of infected epithelium by uninfected—a few weeks at the most in cases other than those involving the nails, and a few months in nail infections.

The optimum and minimum dosage schedules have not as yet been determined. Doses such as one 250-milligram tablet per day, smaller than those originally recommended, have proved adequate to cure many cases.

The experiments of Harry M. Robinson, who attempted to produce griseofulvin resistance in fungus cultures, indicate that resistance to the drug does not develop. If this proves true in vivo as well as in vitro, the antifungal antibiotic affords conspicuous advantages as compared with the antibacterial, penicillin, which often intoxicates and to which resistance either often develops or, even before treatment, already exists.

[1] Colorless, crystalline, neutral, and thermostable, this substance was isolated from *Penicillium griseo-fulvum Dierckx* by Albert E. Oxford and collaborators in 1939. It was identified by J. F. Grove and J. C. McGowan in 1947 as identical with the "curling factor," isolated from cultures of *Penicillium janczewski* in 1945 by P. W. Brian and collaborators, which causes abnormal growth of hyphae of sensitive fungi. Its chemical structure, $C_{17}H_{17}O_6Cl$, has been established and its usefulness demonstrated against fungus infections in plants, particularly botrytis infection of lettuce and alternaria blight of tomatoes. The cure of fungus infections in human beings by the use of griseofulvin was first exhibited at a meeting of the Austrian Dermatological Association on Nov. 27, 1958, by Gustav Riehl, whose 15 patients included 3 with onychomycosis.

Griseofulvin is of remarkably low toxicity. Nausea, epigastric discomfort, diarrhea, and headache occasionally have been observed, along with a few instances of urticarial drug reaction. The side effects have seldom necessitated withdrawal of the drug. Massive doses given to animals experimentally have caused toxic reactions due to damage of the epithelium of the intestines and testes.

The use of griseofulvin does not eliminate need for measures aimed at promoting exfoliation and removal of infected tissues and for preventing reinfection from original sources and contaminated articles, such as shoes. Unfortunately the drug is not effective against a number of medically highly significant infections, including those due to *Candida (Monilia)* and the deep mycoses due to *Cryptococcus, Sporotrichium, Blastomyces, Phialophora,* and *Histoplasma.* (See also CHEMOTHERAPY.)

Psoriasis.—Valuable adjunctively in the treatment of this annoying, problematic, and common disease is the corticosteroid derivative, triamcinolone, which appears to be the only significantly helpful corticosteroid. Cases of psoriasis respond to its administration promptly with resolution of the inflammatory process, which yields more readily to standard topical therapy when triamcinolone is given. Relapse occurs, however, when the drug is withdrawn, unless combined treatment has eliminated the eruption for the time being. Untoward effects must be watched for; the contraindications are the standard ones when cortisone and related chemicals are used. The drug is "potent and valuable" in psoriasis, as noted by Walter B. Shelly and collaborators, and by Max R. Greenlee and William L. Epstein.

Scleroderma.—Indurative dermatoses in which calcium is bound in collagenous tissues have been found favorably responsive to decalcification by the intravenous administration of a chelating agent, Edathamil. This chemical binds metallic ions so that they are eliminated from the body via the urine. Prior to the discovery of its value in dermatology, it was recognized as highly effective in the treatment of lead poisoning.

Bibliography, 1958–59.—Outstanding among the publications of 1958–59 are the following: Bean, William B., *Vascular Spiders and Related Lesions of the Skin* (Springfield, Ill., 1959); Bluefarb, Samuel M., *Cutaneous Manifestations of the Malignant Lymphomas* (Springfield, Ill., 1959); Cochrane, Robert G., ed., *Leprosy in Theory and Practice* (Baltimore 1959); Duperrat, B., *Le Lupus Érythémateux Disseminé* (Paris 1958); Fiese, Marshall J., *Coccidioidomycosis* (Oxford 1958); Gottron, Heinrich A., and Schönfeld, Walther, eds., *Dermatologie und Venerologie,* vol. 2, parts 1 and 2 (Stuttgart 1958); Lewis, George M., *Practical Dermatology,* 2d ed. (Philadelphia 1959); Montagna, William, and Ellis, Richard A., eds., *The Biology of Hair Growth* (London 1958); Riddell, Roland W., and Stewart, Gordon T., eds., *Fungous Diseases and Their Treatment* (London 1958); Roxburgh, Archibald C., *Common Skin Diseases,* 11th ed. rev. by Peter F. Borrie (London 1959); Sauer, Gordon C., *Manual of Skin Diseases* (Philadelphia 1959).

DETROIT. Fifth most populous city in the United States (1950 census: 1,849,568; 1959 est.: 1,875,000), Detroit, Mich., occupies 139.6 square miles and is the center of a metropolitan area of 1,965 square miles including Wayne, Macomb, and Oakland counties (1950 census: 3,016,197; 1959 est.: 3,890,000). For the second successive year the city's estimated population declined from that of the previous year. The estimated 50,000 increase in the population of the metropolitan area was a smaller gain than in recent years.

The city is governed by Mayor Louis C. Miriani and a 9-member Common Council, all elected in November 1957 for 4-year terms.

Net city tax budget (1959–60 fiscal year): $123,745,178. Gross city budget (actual appropriations): $254,440,477. Total city budget, including self-sustaining agencies: $330,661,233. City tax rate (1959): $25.258 per $1,000 assessed valuation. School tax rate: $15.760. School budget:

$166,563,468.30. Net long-term debt of city and city agencies: $368,706,319, including $263,093,159 behind which the city's credit is pledged. Public school enrollment (Oct. 2, 1959): 283,409.

Imports and exports through the customs district of Michigan in 1958: $1,836,000,000, a decrease of $237,400,000 from 1957. Employment in the metropolitan area in 1958 averaged 471,000 in manufacturing and 521,300 in nonmanufacturing. The sharp decline in employment from 1957 reflected the serious effect of the 1958 recession on the Detroit area.

Retail sales in the metropolitan area in 1958 were estimated at $4,478,650,000. The drop of nearly $500 million from the 1957 estimate was also attributable to the recession. Contracts awarded for new construction totaled $528,175,000. On Sept. 15, 1959, the city cost of living index stood at 124.8, four tenths of a point below the national average. The 1958 city average was 123.4.

In a city whose economy depends heavily on the auto industry, the most important development of 1959 was the industry's recovery from the recession of the previous year. Unemployment declined steadily from its early-year level of slightly over 15% of the labor force, retail sales climbed, and the city's auto manufacturers reported substantial increases in earnings for the first nine months of the year. The optimism of business leaders, which had been reinforced by the favorable reception of 1960 cars, especially the new compact models (see AUTOMOBILES), was dampened by the late-year effects of the prolonged steel strike (see IRON AND STEEL; LABOR).

Detroit's importance as a seaport was heightened in 1959 by the opening of the St. Lawrence Seaway (q.v.). The amount of overseas general cargo handled by the port during the first eight months of the year was 300% greater than the total for the same period in 1958. In addition, terminal operators announced plans for $8 million in expanded port facilities during 1960. This expansion is expected to relieve congestion at the docks, at times a serious problem during the 1959 season.

Progress continued on the city's expanding network of expressways, its Civic Center, the redevelopment of blighted areas for industrial use, and the rehabilitation of middle-aged neighborhoods. The Edsel Ford Expressway was completed to the city limits, the last section of the John C. Lodge Expressway was opened to traffic, and work began on a new superhighway—the north-south Walter P. Chrysler Expressway. The National Bank of Detroit moved into a new $20 million downtown building, and land was cleared for a new 32-story Michigan Consolidated Gas Company office building. In the Northland section the new three-story Reynolds Metals Company building, whose architect was Minoru Yamasaki, featured an eye-catching exterior design (see ALUMINUM).

In April, Detroit voters approved a bond issue and a 3-mill tax increase which will raise $90 million for a five-year school construction program. In September, three new colleges opened in or near the city. They are the University of Michigan's Dearborn Center, whose students alternate classroom study with employment, Michigan State University–Oakland near Rochester, and Monteith College, a division of Wayne State University which emphasizes independent study in the humanities.

DIEFENBAKER, John George, Canadian prime minister: b. Neustadt, Grey County, Ont., Sept. 18, 1895. A leading criminal lawyer, John Diefenbaker was elected to the House of Commons in 1940 as a Progressive Conservative from the traditionally Liberal and Socialist province of Saskatchewan. Although he was unsuccessful in his candidacy for the party's leadership in 1948, when the post went to George A. Drew, he won it with no difficulty in 1956 when Drew resigned as opposition leader.

As a result of the national elections of June 10, 1957, the Progressive Conservatives gained control of Parliament through a coalition with the Co-operative Commonwealth Federation (CCF) and the Social Credit Party, and Diefenbaker succeeded Louis S. St. Laurent, Liberal, as prime minister. General elections were held again on March 31, 1958, as a result of the prime minister's wish to increase his majority. The Progressive Conservatives' triumph in the greatest election landslide in Canada's history won them 97 additional seats, giving Diefenbaker a House of Commons majority of 153.

In 1959, Canadian concern for its part in the defense of North America and for the role of the smaller nations in NATO kept the prime minister actively involved in international affairs. On February 20 Diefenbaker announced that his government was reluctantly abandoning its $400 million program for the development of the CF-105 Avro Arrow jet plane, an interceptor for enemy bombers, partly because it would be obsolescent by the time it had become operational (1962). On May 25, in discussing the nuclear defense agreement with the United States of May 22, 1959, Diefenbaker assured Parliament that the pact meant not only that Canada would receive nonnuclear parts of weapons from the United States but that military reactors would be sent to Canada in the near future. He continued to stress throughout 1959, as in a speech to the Canadian Women's Press Club in Ottawa on September 8, that all members of NATO must be considered as equals, and that no triumvirate of power must be allowed to control policy.

On the death in March 1959 of Secretary of State for External Affairs Sidney E. Smith (q.v.), Diefenbaker took over the foreign affairs portfolio, which he had held for four months after becoming prime minister in 1957. Criticism of his dual role in the government mounted in both the press and Parliament until he appointed Howard Green (q.v.) on June 4 as Smith's successor.

With Queen Elizabeth II and President Eisenhower, the Canadian leader participated in the official opening of the St. Lawrence Seaway (q.v.) on June 26. (See also CANADA.)

DIPLOMATIC LIST. See AMBASSADORS AND ENVOYS.

DIRKSEN, Everett McKinley, U.S. senator: b. Pekin, Ill., Jan. 4, 1896. When the U.S. Senate convened for the opening of the 86th Congress at noon on Jan. 7, 1959, Senator Dirksen became Republican minority leader. As such he is chief official spokesman in the Senate for both his party and administration policies. His emergence in this position represented a victory for the conservative segment of the party in face of a challenge from liberal members who claimed that the previous November's elections gave them right to a greater voice in party affairs.

Dirksen worked his way through the University of Minnesota, graduating in 1917, and went overseas with the U.S. Army in World War I, winning a commission from the ranks. He returned to Pekin to go into business and acted as its commissioner of finance from 1927 to 1931. Elected to the U.S. House of Representatives in 1932, he served in the

PLETCHER IN THE SIOUX CITY JOURNAL

"What Big Teeth You Have, Grandma!"

73d through 80th Congresses, resigning in 1949 because of an eye ailment. In 1950 he won a seat in the Senate from the then Democratic majority leader, Scott W. Lucas, and in 1956 was re-elected.

Dirksen is a seasoned and devoted party regular, adroit parliamentarian, and eloquent orator of the old-fashioned school. Originally a strict isolationist, he was also an ardent backer of the late Sen. Robert Taft at the 1952 Republican National Convention, which nominated Dwight D. Eisenhower. He subsequently moved closer and closer to the president's internationalist policies. In the 85th Congress, in which he was the minority whip, under the leadership of former Sen. William F. Knowland, Dirksen supported the president in 88% of his votes.

DISARMAMENT. Described by both President Eisenhower and Soviet Premier Khrushchev as "the most important question facing the world today,"[1] disarmament was again the subject in 1959 of much discussion, some negotiations, and little progress. Disarmament proposals advanced during the year by various national spokesmen had negligible effects in reducing the postwar East-West armaments race. In general, a principal division between the Eastern and Western powers on the disarmament issue appears to stem from the West's attitude that certain political differences should be solved before disarmament can be effected, and the East's belief that disarmament can take place without the prior settlement of political questions. In the absence of political settlements, the West has insisted that disarmament steps must be accompanied by self-enforcing international arms controls, and the East has advocated general agreement on disarmament measures with little, if any, provision for controls or enforcement.

The principal agreement on disarmament reached in 1959 was the unanimous sponsorship on October 28 by the members of the U.N. General Assembly of a resolution referring to a new 10-nation Disarmament Committee the disarmament proposals advanced before the General Assembly in September by Premier Khrushchev and British Foreign Secretary Selwyn Lloyd. A major step toward disarmament was the continued suspension in 1959 of nuclear weapons tests by the three nuclear powers. (See Atomic Energy.) Ironically, the three-power Conference on the Discontinuance of Nuclear Weapons Tests continued to meet at Geneva during the year without reaching an agreement to do permanently what the three nations had unilaterally done on at least a temporary basis.

Ten-Nation Disarmament Committee.—It was announced on Sept. 7, 1959, that a new 10-nation Disarmament Committee had been established to negotiate on disarmament. The new committee comprises five Western nations (Canada, France, Great Britain, Italy, and the United States) and five Eastern countries (Bulgaria, Czechoslovakia, Poland, Rumania, and the Soviet Union). Although the group was formed outside the United Nations, it will report to the 82-member U.N. Disarmament Commission, which approved of the committee's formation on September 10, and it is scheduled to hold its first meeting in early 1960 at the United Nations European headquarters at Geneva. The 10-nation Disarmament Committee, which was initially set up by the foreign ministers of the Big Four powers who met at Geneva in July and August, was formed primarily because of the Soviet Union's insistence on parity in the representation of East and West at all future disarmament negotiations.[2]

Soviet Proposals.—During his visit to the United States, Soviet Premier Khrushchev proposed before the U.N. General Assembly on Sept. 18, 1959, a three-stage plan for "general and complete disarmament" within four years. His proposals (by stages) provided for: (1) limitations in the armed forces of the Soviet Union, the United States, and Communist China to 1,700,000 men, and of Britain and France to 650,000; (2) liquidation of all armies and of military bases in foreign countries; and (3) abolition of air forces, nuclear weapons, and rockets under (unspecified) international controls. Anticipating objections to his plan for total disarmament, the Soviet premier recommended the following five alternate measures for partial disarmament:

(1) Formation of a control and inspection zone in western Europe, with reductions in the foreign armed forces based in these countries.
(2) Establishment of a zone in central Europe from which nuclear weapons would be banned.
(3) Withdrawals of foreign troops from European countries and the abolishment of foreign military bases there.
(4) Signing of a nonaggression pact between the NATO and Warsaw Treaty member nations.
(5) Conclusion of an agreement for the prevention of surprise attacks.

It was noted at the time that all of Khrushchev's proposals for partial disarmament had been previously advocated by the USSR in recent years. Many observers declared that his proposals for total disarmament were unrealistic in view of the USSR's many past refusals to agree to partial disarmament measures. However, U.S. Secretary of

[1] In a joint communiqué issued Sept. 27, 1959, at the conclusion of their private talks held at Camp David, Md.

[2] The USSR had announced on Nov. 4, 1957, that it would boycott meetings of the 11-member U.N. Disarmament Commission and its 5-nation Disarmament Subcommittee because of what it considered a lack of parity in their representation. The membership of the Disarmament Commission was increased to 25 nations on Nov. 19, 1957, but the USSR continued to boycott its work. The membership was then further increased, at Soviet insistence, to include all members of the United Nations on Nov. 4, 1958.

State Christian A. Herter stated that Khrushchev's speech may have been propaganda, but emphasized that it deserved serious study by the newly established Disarmament Committee.

Other Soviet disarmament proposals during 1959 included those proposed in June for establishing an "atom-free zone" in the Scandinavian Peninsula and the Baltic area, and in the Balkan countries and the Adriatic area. These proposals were similar to the so-called Rapacki Plan of 1957 (named after the Polish foreign minister, Adam Rapacki), which advocated a ban on stockpiling and manufacturing nuclear weapons in central Europe.

Western Plan.—On Sept. 17, 1959, British Foreign Secretary Selwyn Lloyd presented to the U.N. General Assembly a three-stage disarmament plan for consideration by the new Disarmament Committee. The plan (by stages) involved: (1) agreement by Britain, the Soviet Union, and the United States to ban nuclear weapons tests under effective international controls; (2) studies by these powers leading to agreements for the cessation of nuclear weapons manufacture and for the imposition of ceilings on conventional armed forces; and (3) bans on both the use and manufacture of nuclear weapons, prohibition of the use of outer space for military purposes, and "the reduction of other weapons and armed forces to levels which will rule out the possibility of aggressive war." These proposals were similar in many respects to the Western disarmament plan submitted in 1957 to the U.N. Disarmament Subcommittee and subsequently rejected by the USSR.

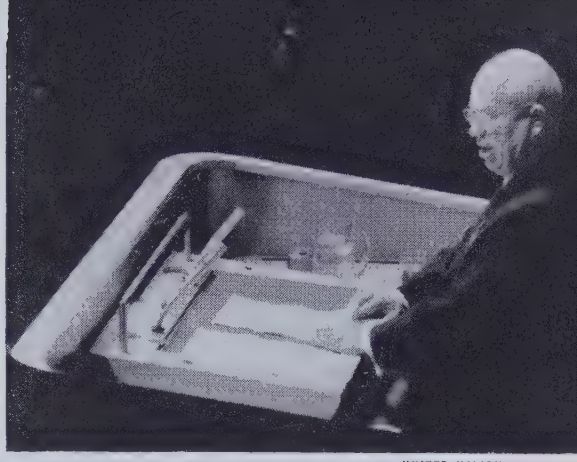
Conference to Ban Nuclear Weapons Tests.—The three-power Conference on the Discontinuance of Nuclear Weapons Tests, which convened at Geneva on Oct. 31, 1958, continued its efforts throughout 1959 to draft a treaty banning nuclear tests under a mutually agreeable detection and control system. At the end of the year the delegates had agreed to a preamble, 17 articles, and an annex of a proposed 25-article treaty, and were in the midst of negotiating concessions on such crucial issues as controls and inspection.

Major points of controversy at the conference were the staffing of international control posts on the territories of the countries concerned and the amount of freedom to be allowed inspection teams in investigating possible violations of the nuclear ban. The heads of the British and United States delegations, David Ormsby-Gore and James J. Wadsworth, respectively, initially insisted that a so-called host country should not staff the control posts on its territories with its own nationals, as was originally demanded by the Soviet chief delegate, Semyon K. Tsarapkin, who also asked that only one or two "outside observers" be stationed at each of these posts. After protracted discussions, the Western delegates agreed that a host country might fill one third of the service, technical, and supervisory positions at control posts with its own citizens, with one third provided by the other two nuclear powers and the final third by other countries. The Soviet delegation finally conceded that 10 or 11 foreign specialists might be stationed at the posts, but it has insisted despite Western objections that the chief of each post must be a citizen of the host country.

The Western delegates have also maintained that inspection teams should be allowed to investigate at the site all unidentified seismic events having a measurable force of 5 kilotons or more, and that they should be permitted to make "on-site" inspections of 20% of those events having a force less than that amount.[3] The Soviet position has been that the number of on-site inspections should be limited to a specified number each year.

Limited agreement was reached at the conference on technical matters. Following a proposal by the United States and Britain, which was accepted by the USSR, a meeting of technical experts was held at Geneva on June 27–July 10 to study measures for the detection of high-altitude nuclear tests. The experts recommended that 5 or 6 earth satellites should be orbited in order to monitor and detect possible high-altitude explosions. The Soviet delegation also accepted an American proposal for a meeting of technical experts to study new data accumulated by the United States relating to the difficulties of detecting underground nuclear weapons tests. However, a working party of technical experts which met on Nov. 25–Dec. 19, 1959, failed to agree on the scientific methods that could be used to detect underground nuclear tests, and the Soviet scientists rejected the test data submitted by the United States. (See also ATOMIC ENERGY.)

[3] The 3-power conference of technical experts which met at Geneva on July 1–Aug. 21, 1958, reported that the number of seismic events of 5 kilotons or more would vary each year from 20 to 100, and that unidentifiable events of less than that force would be much greater in number. (See also SEISMOLOGY.)



UNITED NATIONS

In an address before the United Nations General Assembly, September 18, Soviet Premier Khrushchev presents his proposals for "complete" world disarmament within four years.

Among the more important articles on which the delegates have agreed, after concessions by both sides, are provisions for the retention of a veto power by each nation on treaty amendments (excluding accusations of a treaty violation), and for a treaty of unlimited duration which would be reviewed after two years for possible improvements. Another major agreement, reached November 30 in the form of a draft annex, provided for the establishment of a preparatory control commission after the treaty is concluded. The conference was adjourned from Dec. 19, 1959, to Jan. 12, 1960.

(For details of other disarmament resolutions approved by the U.N. General Assembly, see UNITED NATIONS; for information regarding a future summit meeting at which disarmament would be discussed, see SUMMIT CONFERENCE.)

DISASTERS. See the CHRONOLOGY at the front of this volume; METEOROLOGY AND CLIMATOLOGY; and the Index entry, *Disasters*.

DISCIPLES OF CHRIST. Total membership in the United States in 1959 was 1,921,899, organized into 7,945 congregations which were served by 8,671 ministers. World membership, organized in 10,139 congregations, was 2,244,039. Contributions for all missionary, educational, and benevolent causes amounted to $11,266,509.71 in 1958.

The 1959 assembly was held in Denver, Colo., August 28–September 2, with registrations numbering 9,049. Dr. Loren E. Lair of Des Moines, secretary of Iowa churches, was elected president for 1960. The convention celebrated the 150th anniversary of the address by Thomas Campbell which is considered to be the basic document upon which the denomination was launched. The assembly also acted to merge its student work with that of the Presbyterians, the United Church of Christ, and the Evangelical United Brethren churches, under the name Campus Christian Life.

Overseas missions were served in 14 fields with 244 missionaries and 2,183 national leaders. There was a net membership gain of 5,127 in the mission field, bringing the total to 130,539; baptisms overseas numbered 9,681.

Beginning in 1960 the Disciples of Christ will follow a 10-year program which is to be known as the Decade of Decision and which will stress evangelism and the establishment of new churches.

The national headquarters are located at 221 Ohmer Ave., Indianapolis, Ind. Publications include *World Call,* a monthly, and *The Christian Evangelist—Front Rank,* a weekly.

DISTILLING INDUSTRY. Production.—The production of beverage distilled spirits at registered and fruit distilleries during the fiscal year ended June 30, 1959, as compared with audited figures for the fiscal year 1958, was as follows, in tax gallons:[1]

	July 1, 1958—June 30, 1959	July 1, 1957—June 30, 1958
Whiskey	148,248,812	119,086,642
Brandy	7,398,929	5,738,903
Rum	1,968,722	2,197,738
Gin	16,660,639	16,370,280
Vodka	7,569,937	8,443,558
Spirits	78,550,323	72,634,535
Total	260,397,362	224,471,656

Rectified Spirits.—Data on rectified spirits in the fiscal year 1959 (with 1958 figures in parentheses) are as follows: rectifying plants used 80,424,744 proof gallons of domestic and imported liquors (77,919,808); production by rectification amounted to 81,467,933 proof gallons (78,691,899). Whiskey accounted for 65,238,107 gallons of the total production by rectification (63,923,356).

Output for Consumption.—During the calendar year 1958 the bottled output of domestic distilled spirits, plus imported spirits bottled after withdrawal from customs warehouses, totaled 188,957,867 wine gallons, as compared with 183,606,943 gallons during 1957, an increase of 5,350,924 gallons, or 2.9%. Whiskey bottled during 1958 amounted to 140,280,407 wine gallons, accounting for 74.2% of total distilled spirits bottled, as against 134,608,587 gallons during 1957, or 73.3% of total spirits. Of the total whiskey bottled during 1958, spirit blends amounted to 72,733,889 gallons; bonded, 11,146,962; straight, 55,431,574; and blended straights, 967,982. The remainder of the bottled output consisted of gin, 19,280,407 gallons; rum (bottled in continental United States and not including rum imported from Puerto Rico), 749,003; brandy, 4,644,962; cordials, liqueurs, and similar output, 7,161,286; vodka, 15,100,525; and miscellaneous (including products bottled for exportation), 1,389,369.

Withdrawals.—Tax-paid and tax-free withdrawals (in tax gallons) during the fiscal year 1959, compared with 1958, were as follows:

	July 1, 1958—June 30, 1959	July 1, 1957—June 30, 1958
Tax-paid withdrawals:		
Whiskey, bottled-in-bond[1]	10,605,515	11,710,983
Whiskey, total	81,241,284	79,515,387
Brandy	4,400,155	4,118,866
Rum	186,680	212,895
Gin	16,498,713	16,342,349
Vodka	7,540,524	8,345,530
Spirits[2]	49,890,738	46,123,716
Alcohol[3]	7,998,533	10,438,377
Total	167,756,627	165,097,120
Tax-free withdrawals:		
For addition to wine	36,774,498	32,328,869
For denaturation	1,826,395	1,698,804
For export	1,573,788	1,373,353
Transfers to customs manufacturing bonded warehouses	543,713	1,961,553
For vessels and aircraft	3,081	6,960
For use of the United States	...	442
To foreign trade zones	2,232	277,751
Total	40,723,707	37,647,732

[1] Included in total whiskey. [2] Produced at registered distilleries. [3] Produced at industrial alcohol plants.

Apparent Consumption.—The apparent consumption of distilled spirits in the United States during the calendar year 1958, as compiled by the Distilled Spirits Institute, amounted to 215,465,819 wine gallons, an increase of 1.6% compared with 1957. These figures are based on actual wholesale and retail sales in the monopoly states, and on tax collections or gallonage shipments to wholesalers in the license states. Consumption amounted to 159,257,005 gallons in the license states, or 73.9% of the total, and 56,208,814 gallons in the monopoly states, or 26.1% of the total.

The following table shows apparent consumption (in wine gallons) in the ten leading states in 1958, compared with 1957, and indicates the type of control:

	1958	1957	
New York	27,884,993	26,167,591	(license)
California	23,755,946	23,010,031	(license)
Illinois	15,391,251	15,620,873	(license)
Ohio	11,776,172	12,225,474	(monopoly)
Pennsylvania	11,025,114	11,032,749	(monopoly)
New Jersey	9,960,894	9,331,003	(license)
Florida	8,334,702	8,040,601	(license)
Michigan	7,955,667	8,795,231	(monopoly)
Massachusetts	7,824,136	7,468,521	(license)
Texas	7,805,210	8,223,681	(license)

Per capita consumption of distilled spirits in the United States during 1958 was 1.24 wine gallons.

Stocks.—Stocks of whiskey and other distilled spirits remaining in internal-revenue bonded warehouses on June 30, 1959, as compared with stocks of June 30, 1958, at original entry gauge and before determination of losses owing to leakage, evaporation, and related factors, were as follows (in tax gallons):

	June 30, 1959	June 30, 1958
Whiskey	782,853,090	750,528,319
Brandy	16,912,103	16,316,108
Rum	1,033,689	1,117,652
Gin	1,466,824	1,801,716
Vodka	441,032	447,130
Spirits	86,071,975	88,070,118
Total	888,778,713	858,281,043

Public Law 85–859, approved Sept. 2, 1958, extended the period during which distilled spirits may be retained in bonded warehouses from 8 to 20 years.

Revenues.—Revenues accruing to the federal government from distilled spirits during the calendar year 1958 amounted to $2,151,646,000, an increase of 3.3%, compared with 1957. This amount accounted for 71.3% of federal collections from alcoholic beverages. Taxes on beer ($3,015,967,000) amounted to 25.5% of the total alcoholic beverage receipts, and wine accounted for 3.2%. The federal excise tax rate on distilled spirits was $10.50 per proof gallon.

Imports.—United States dutiable imports of distilled spirits during the calendar year 1958 amounted to 30,144,102 tax gallons, with whiskey comprising 26,894,323 gallons of the total. In addition, 2,227,123 gallons of spirits were received from Puerto Rico and the Virgin Islands.

Exports.—In 1958 exports of distilled spirits from the United States to foreign destinations (exclusive of military shipments) amounted to 2,208,815 proof gallons. In addition, 616,632 gallons were shipped to Puerto Rico, the Virgin Islands, Alaska, and Guam.

Distillers' Dried Grains.—Production of distillers' dried grains at registered and fruit distilleries during 1958 consisted of 198,400 tons of dark grains, 44,100 tons of light

[1] As used herein, a tax or proof gallon is a standard United States gallon of 231 cubic inches containing 50% of ethyl alcohol by volume; a wine gallon is a standard United States gallon regardless of proof.

grains, and 50,700 tons of dried solubles, or a total of 293,200 tons.

HOWARD T. JONES,
Executive Secretary,
Distilled Spirits Institute, Inc.

DISTRICT OF COLUMBIA. This Federal District of the United States, comprising an entirely urban area of 61 square miles, is coextensive with the city of Washington, the national capital. Population of District: (1950) 802,178; (est., July 1, 1958) 828,000; of metropolitan area: (1950) 1,464,089; (est., April 1, 1956) 1,884,000.

Government.—Administration is handled by a Board of Commissioners, two of whose three members are civilians appointed by the president of the United States, with the consent of the Senate, and the third, a member selected from the Corps of Engineers of the U.S. Army. Commissioners in 1958 were: Robert E. McLaughlin, president, David B. Karrick, and Brig. Gen. A. C. Welling. The secretary of the board was G. M. Thornett; finance officer, Kenneth Back; corporation counsel, Chester H. Gray; and superintendent of schools, Dr. Carl F. Hansen.

Legislative power is vested in the U.S. Congress, which generally seeks advice from the Board of Commissioners regarding proposed legislation. District residents do not vote in elections. A federal Court of Appeals, a federal District Court, a Municipal Court of Appeals, and a Municipal Court serve the District.

Finance.—In the 1958–59 fiscal year, District revenue comprised $152,677,127 from District tax sources, $48,757,405 from the federal government, and $31,215,360 from all other sources. Tax revenue consisted of $21,133,577 from a 2% general sales tax and a 1% food tax, $22,836,616 from individual income taxes, $7,583,307 from corporate income taxes, $11,309,184 from motor fuel taxes, $10,531,755 from licensing, and $79,282,688 from all other District sources. Expenditures of $255,795,472 comprised $58,967,715 for education, $93,459,014 for health, welfare, and safety, $30,238,873 for highways and streets, and $73,129,870 for other purposes. Long-term indebtedness on June 30, 1959, amounted to $33,787,689.

Banking.—As of June 10, 1959, the District's 5 national banks had assets of $933,110,000, demand deposits of $642,950,000, and time deposits of $200,269,000. The 7 District banks had $692,229,000 in assets, $448,161,000 in demand deposits, and $182,675,000 in time deposits.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. The National Education Association estimates that District operating expenditures for public elementary and secondary education in the 1958–59 school year totaled $44,330,000 ($434.43 per pupil), and that revenue comprised $7 million from the federal government and $46,250,000 from the District. Outlays for construction and interest payments amounted to $8,920,000. Teachers' salaries (1958–59) averaged $6,093 (senior high, $6,719; junior high, $6,075; vocational high, $6,247; elementary, $5,843).

EDUCATIONAL STATISTICS FOR THE DISTRICT OF COLUMBIA, 1958–59

Type of school	No.	Teachers	Students
Public elementary (k-6)	128	2,353	75,382
Public junior high (7–9)	23	945	20,430
Public senior high (10–12)	10	628	13,555
Public vocational high	5	165	2,389
Private and parochial elementary and secondary	78	...	17,593
Veterans high school centers	1	25	605
Capitol page schools	1	6	29
District teachers colleges	1	58	1,189

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and District funds (excluding institutional costs) totaled $13,029,802, including $2,447,996 for the aged, $6,707,021 for dependent children, and $2,243,796 for the permanently and totally disabled. A monthly average of 23,347 persons received public assistance. District expenditures for all mental health activities in the same year totaled $15,072,000; for correctional and penal programs, $6,017,000.

Labor Force.—As of June 30, 1959, there were 234,000 civilian employees of the federal government in the Washington metropolitan area. Nongovernmental employees covered by the District Unemployment Act averaged 223,419 in 1958 and received $971,128,904 in wages, up 4.5% over 1957 totals; and District government employees covered by the same act numbered 22,657 and received $117,838,330 in wages, an increase of 9.9% over 1957. Average covered employment and wages paid in major nongovernment categories were as follows: wholesale and retail trade, 82,318 employees ($329,458,511); service industries, 53,942 ($221,148,165); transportation, communications, and other public utilities, 22,406 ($117,390,845); contract construction, 19,177 ($97,114,159); and finance, insurance, and real estate, 25,407 ($94,880,169).

Manufacturing.—Manufacturing activities in 1958, chiefly printing and publishing and food processing, employed 20,040 covered employees who received $110,480,637 in wages from 617 employers. Production workers averaged $95.04 for an average workweek of 39.6 hours in August 1959.

Transportation and Communications.—District and federal funds disbursed for roads and streets in the District proper in the 1959–60 fiscal year totaled $22,029,325, and 49 miles of new construction were completed.

Highways and roads totaled 1,253 miles (1,080 surfaced) on June 30, 1959. Registered *motor vehicles* numbered 206,184 on Aug. 31, 1959, including 157,751 passenger cars. There were (1959) 7 *railroads* operating 44 line miles; 13 regularly scheduled *airlines;* and 4 *airports and airfields* (3 military and 1 commercial and municipal).

Communications media (1959) included 7 AM and 9 FM *radio stations;* 4 VHF and 1 UHF *television stations;* 3 daily *newspapers* (circulation, 823,000) and 5 other newspapers (55,000); and (January 1) 283,700 business and 316,400 residential *telephones.*

Principal Events, 1959.—Ground was broken on February 24 by House Speaker Sam Rayburn for the alteration of the Capitol's east-central front. The new $10 million marble portico, expected to be completed in early 1961, will duplicate the original structure in all details, except that it will extend 32½ feet beyond the center section of the Capitol. President Eisenhower laid the cornerstone on July 4 with implements used by George Washington for laying the initial cornerstone 166 years earlier.

On April 14 the president dedicated a monument to the late Sen. Robert A. Taft. The 100-foot tower of Tennessee marble, containing a 27-bell carillon, stands on Capitol Hill.

The National Shrine of the Immaculate Conception, in northeast Washington, was dedicated by the Roman Catholic hierarchy of the United States on November 20. Seventh-largest church in the world and largest Roman Catholic edifice in the United States, the vast Romanesque-Byzantine basilica, originally planned in 1914 as a shrine to the Virgin Mary, patroness of American Catholics, has been under construction since 1922. Measuring 459 feet in outside length and 240 feet in outside width, the cathedral, when completed, will have numerous subsidiary chapels radiating from the central edifice and will contain 20 altars. Eventual cost is expected to reach $30 million, of which $18 million has been spent. A unique feature of its construction is the omission of structural steel and its utilization, as in medieval cathedrals, of enormously thick walls and stone and masonry supports. (See also RELIGION.)

Late in the year, architect Edward Stone unveiled plans for a $61 million national cultural center on the banks of the Potomac River near the Lincoln Memorial. To consist of a series of white

buildings set in a terraced landscape, the center will include a grand salon for official functions, an opera house with a seating capacity of 3,000–4,000, two small auditoriums, a 3,000-seat concert hall, a playhouse of 1,000–1,800 seating capacity, and an underground garage.

DIVIDENDS. See BUSINESS DATA, U.S.
DIVORCE. See MARRIAGE AND DIVORCE.

DODECANESE ISLANDS. A group of 14 inhabited islands and some 40 islets in the Aegean Sea, forming a government general of Greece. Area, 1,035 square miles (of which the island of Rhodes comprises 537); pop. (1951), 121,480. The city of Rhodes (23,599) is the capital. Crops include olives, grapes, tobacco, and oranges. Handicrafts, sponge fishing, and sheep and goat raising are important.

DOG SHOWS. See SPORTS, GAMES, AND SHOWS.
DOMINICA. See WEST INDIES FEDERATION.

DOMINICAN REPUBLIC. This Caribbean republic comprises the eastern two thirds of the island of Hispaniola, and borders Haiti on the west. Area, 18,816 square miles; pop. (est. July 1, 1958), 2,791,000, mostly of mixed European, Indian, and Negro descent. The predominant language is Spanish. About three fourths of the population live in rural areas. Chief cities (with estimated 1957 populations) are Ciudad Trujillo, the capital (272,759); Santiago de los Caballeros (66,804); San Francisco de Macorís (22,223); and San Pedro de Macorís, a sugar center (21,350).

Government.—Generalissimo Rafael Leonidas Trujillo Molina has ruled as military dictator of the republic since 1930, and heads the only political organization, the Dominican Party. He was succeeded as president of the country in 1952 by his brother, Gen. Hector Bienvenido Trujillo Molina, who was re-elected without opposition to a second 5-year term in 1957. The legislature consists of a 23-member Senate and a 52-member Chamber of Deputies chosen by popular vote for 5-year terms.

Education and Religion.—Illiteracy is high (56.8% of the population aged 10 years and over in 1950). Primary education is free and compulsory for children aged 7–14 years. At the end of 1957 there were 4,536 public schools with a total enrollment of 487,195 pupils. The University of Santo Domingo had 3,828 students in 1957. The state religion is Roman Catholicism.

Finance.—Actual government expenditure in 1957 was 153.2 million pesos (up 11.6% over 1956); revenue, 154.7 million pesos (up 13.0%). The peso is equal to the United States dollar.

Transportation and Communications.—The highway system, which totaled 2,682 miles in 1957, is being expanded; contracts amounting to 35 million pesos were granted in early 1959 for the construction of 200 miles of new roads. In 1957, 1,641 ships with a net tonnage of 2,805,887 cleared Ciudad Trujillo and other ports. Five international airlines and one domestic airline serve the Dominican Republic. Passenger cars numbered 8,600 in 1957; commercial vehicles, 6,000; telephones, 14,675; and television sets, 7,000.

Production.—The sugar industry accounts for nearly half of Dominican export value and employs over half of the labor force. Production of sugar was adversely affected by a reduction of 7.5% in the republic's basic export quota of 655,000 tons annually which was made in February 1959 under the International Sugar Agreement, and by continuing low prices on the world market. Estimated sugar exports in 1958 totaled 737,000 short tons (a decline of 13% from 1957). Other chief cash crops and estimated outputs for export in 1958 are: coffee, 300,000 bags of 132.3 pounds each (down 43% from 1957); cocoa beans, 78 million pounds (1958–59 est.); and leaf tobacco, 25.4 million pounds. Subsistence crops include corn, rice, dry beans, bananas, and peanuts, production of which in 1959 was unofficially estimated at a record 71,500 short tons (unshelled).

Manufacturing is on a small scale. In 1957 there were 2,993 industrial establishments with 87,290 workers and a gross sales value of 219,050,217 pesos. Chief manufactures are tobacco products, chocolate, textiles, furniture, cement, tiles, bricks, straw hats, soap, hides, shoes, and fertilizer. Minerals include gold, copper, iron, silver, platinum, rock salt, bauxite, and petroleum. Output of electricity in 1957 was 258.1 million kw.-hr. (up 11.2% over 1956). Tourism continued to decline due to unsettled political conditions in the Caribbean; in 1958 there were 38,286 tourists, or about 2,000 fewer than in 1957, and income from tourism totaled 4.1 million pesos, a decline of 14% from the previous year. National income in 1957 increased 13% to 645.3 million pesos, but as the cost-of-living index rose about 5% in the same year, the rise in national income was in part merely a price rise.

Foreign Trade.—In 1958, Dominican exports were valued at 136.6 million pesos; imports, at 130.6 million. Leading exports and 1958 values are: sugar, 60.7 million pesos; cacao, 28.6 million; coffee, 23.8 million; and tobacco, 4.8 million. Principal imports are cotton goods, machinery and vehicles, foodstuffs, and fuels. The republic's chief trading partner is the United States, which in 1958 took about 50% of Dominican exports and supplied 60% of imports.

Principal Events, 1959.—Attempted small-scale invasions of the Dominican Republic by armed rebels reportedly operating out of Cuba were crushed by Dominican armed forces during June. About 60 rebels landing by plane in the central mountain region on June 14 were allegedly annihilated, and another 140 insurgents attempting to land from two motor launches at two points on the northern coast were largely wiped out on June 19. The invasions failed in their apparent intent to ignite a general revolt against the Trujillo regime. The rebel force, consisting of Dominicans, Cubans, and Puerto Ricans, was reportedly dispatched by the Dominican Liberation Movement, which is based at Havana, Cuba. As a result of the attempted invasions, the government bolstered its defense forces by expending $50 million for the purchase of armaments from other nations in 1959, and this expenditure was viewed as a serious threat to the country's economic stability.

The Dominican government charged that Cuba and Venezuela were planning to invade the republic, but then withdrew the charges from discussion by the Organization of American States on July 10. Increasingly strained relations between the Dominican Republic and its two neighbors resulted in the breaking off of diplomatic ties with the Trujillo government by Venezuela on June 12, and by Cuba on June 26. (See also CUBA; ORGANIZATION OF AMERICAN STATES.)

W. R. F.

DONATIONS AND BEQUESTS. See PHILANTHROPY.

DONOVAN, William Joseph (76), American soldier and public official: b. Buffalo, N.Y., Jan. 1, 1883; d. Washington, D.C., Feb. 8, 1959. A man of remarkably varied abilities who achieved prominence as a lawyer, soldier, political candidate, public official, and diplomat, William J. ("Wild Bill") Donovan was probably best known as the director of the Office of Strategic Services, the United States intelligence network during World War II. Awarded the National Security Medal in 1957 for his wartime intelligence services, he thus became the first person to receive the nation's four highest decorations, having previously received the

Congressional Medal of Honor, the Distinguished Service Cross, and the Distinguished Service Medal for his military exploits in World War I.

He was graduated from Columbia College in 1905 and from the Columbia School of Law in 1907, the year he became an attorney in Buffalo, N.Y. In 1912 he joined the New York National Guard, and in 1916 saw service on the Mexican border. He served in 1917–18 with the U.S. Army in France as a battalion commander of the 77th Division's 165th Infantry Regiment (formerly, the "Fighting 69th" New York Infantry Regiment). The story is that the men under his command nicknamed him "Wild Bill" because of his insistence on an arduous training program.

After the war he resumed his law practice and was active in New York politics as the unsuccessful Republican candidate for lieutenant governor in 1922 and governor in 1932. He was federal district attorney for western New York (1922–24), assistant attorney general of the United States (1924–25), and assistant to the attorney general (1925–29). In 1929 he returned to private law practice.

Donovan visited England in 1940 as an unofficial observer for Secretary of the Navy Frank Knox. He also undertook a secret government mission to Yugoslavia, Greece, and the Middle East in 1940 and early 1941. He was appointed coordinator of information in July 1941, and then (as brigadier general, 1943; major general, 1944) headed the Office of Strategic Services (OSS) from its inception on June 13, 1942. The OSS directed espionage and sabotage in all war theaters, except the Pacific command of Gen. Douglas MacArthur, until its termination on Oct. 1, 1945. (The military agency's basic techniques and many of its personnel were later absorbed by the civilian Central Intelligence Agency.) After the war, Donovan served as ambassador to Thailand from 1953 to 1954.

DOWLING, Walter C., American diplomat: b. Atkinson, Ga., Aug. 4, 1905. On Nov. 7, 1959, President Eisenhower announced the recess appointment of Dowling as U.S. ambassador to the Federal Republic of Germany, to succeed David Bruce.

Appointed a foreign service officer in 1931, six years after graduating from Mercer University, he served in Oslo, Lisbon, Rome, and Rio de Janeiro. He was then assigned to the Division of Southern European Affairs in the Department of State (1945–49). Deputy high commissioner for Austria (1950–52) and Germany (1953), he became minister of the American embassy at Bonn, Germany, in 1955. He served as ambassador to South Korea from 1956 until a few weeks before the recess appointment, when he returned to Washington to assume the position of assistant secretary of state for European affairs.

DRAMA. See THEATER.
DRESS. See FASHIONS.
DRUG TRAFFIC. See NARCOTICS.

DRUGS. Production of acetylsalicylic acid (aspirin) in the United States totaled 21 million pounds in 1958, up 3 million pounds over 1957, according to the U.S. Tariff Commission. Penicillin production was down from 543.2 trillion international units in 1957 to 493.3 in 1958, probably because of increased use of other antibiotics. Production of streptomycin increased by 5%, and that of dihydrostreptomycin by 10% over 1957. Total production of synthetic medicinal chemicals was 101.3 million pounds in 1958, compared with 98.5 million pounds in 1957.

Sales of pharmaceuticals at the manufacturer's level in 1958 were valued at $2.3 billion. Ethical, or prescription, products accounted for $1.8 billion of this total, while $500 million was in proprietary products. Sixty-eight per cent of total pharmaceutical sales were accounted for by 20 of the largest manufacturers.

The number of employees in the United States pharmaceutical industry totaled 104,100 in March 1959, including 57,600 production or nonsupervisory workers. Weekly gross earnings for production workers increased from an average of $82.82 for the year 1957 to $88.73 in March 1959, according to the U.S. Bureau of Labor Statistics, while weekly hours for these employees averaged 40.8 in both the year 1957 and March 1959.

According to the Pharmaceutical Manufacturers Association, $170 million was spent in 1958 by the pharmaceutical industry for research and development. This represents 9.5% of the sales dollar, as compared with an average of 2.9% of the sales dollar expended for research by industry in general. Over $190 million was budgeted for research and development in 1959.

There were 584 million prescriptions filled by pharmacists in the United States in 1958 at an average price of $3.08. Some 50% of all pharmaceutical production is sold through drugstores; 22% is distributed by hospitals, and nearly 17% of total production is exported.

According to *F-D-C Reports,* antibiotics continued to lead in drug sales in 1958, remaining at about the $350 million level. The cortical steroid market increased from less than $90 million to about $94 million in 1958. Public apathy during 1958 and early 1959 was responsible for the destruction of some 12 million doses of outdated Salk polio vaccine, which has a 6-months' life.

Altogether the industry in 1958 began to experience a lessening of profit margins due to rising costs and expenses, and to intense competition, accompanied by a leveling in volume.

There were 370 new specialty products introduced to the market during 1958; 44 represented new single chemical entities, compared with the ten-year peak of 51 in 1957. Dermatologicals led the field with 34 new products introduced. Five new antibiotics were developed to combat resistant staphylococcic infections, a subject of increasing medical concern during 1958.

Drug Topics estimated total sales for some 54,000 drugstores at $6.7 billion in 1958, up 3.7% over the previous peak of $6.4 billion in 1957. Drugstore prescription volume was $1.8 billion, compared with $1.6 billion in 1957. Sales of packaged medications increased 2.3% over 1957, to a new high of $1.2 billion.

DULLES, John Foster (71), American statesman: b. Washington, D.C., Feb. 25, 1888; d. Washington, May 24, 1959. Distinguished first as a skillful lawyer who achieved renown in the field of international law, then as State Department adviser under a Democratic administration and as foreign policy spokesman for the Republican Party, Dulles reached the climax of his career as one of the nation's most active, dedicated, and powerful secretaries of state.

He was the son of the Rev. Allen Macy Dulles (1854–1930), a Presbyterian minister and professor of theism and apologetic; the grandson of John Watson Foster (1836–1917), secretary of state in 1892–93; and the maternal

nephew of Robert Lansing (1864–1928), secretary of state from 1915 to 1920. Young Dulles attended Princeton University, graduating in 1908 as valedictorian of his class. He then lived in Paris for a year, as a scholarship student at the Sorbonne, after which he studied law for two years (1909–11) at George Washington University.

While at Princeton, he accompanied his grandfather, Secretary of State Foster, to the Second Hague Conference (1907), where Foster served as representative for China and Dulles was secretary to the Chinese delegation. In 1911 he was admitted to the New York State bar and joined the law firm of Sullivan & Cromwell, specialists in international law. (He became a partner in 1920 and a senior partner in 1944.) In addition to his private practice, which usually included assignments in the international field, he was frequently called upon to serve the federal government. His uncle, Secretary of State Lansing, appointed him to represent the United States at the Second Pan-American Scientific Congress in 1917. He was also a special agent of the State Department in Central America.

During World War I, although rejected for active military duty because of poor eyesight, he was commissioned a captain (later, major) in the U.S. Army, where he was assigned to the economic section of the General Staff's military intelligence division and, subsequently, to the War Trade Board as General Staff representative and assistant to the chairman. In 1918–19 he served as reparations counsel to the American Commission to Negotiate Peace; and in 1919, as a member of the Reparations Commission and the Supreme Economic Council, he attended the Versailles Peace Conference. Between the two world wars his assignments included that of legal adviser at the 1927 Polish financial stabilization plan negotiations and that of representative for American banking interests at the German debt conferences of 1933–34.

During and after World War II, Dulles, a lifelong Republican, rose to become his party's foreign policy spokesman. In 1945, following his participation in the 1944 presidential campaign as foreign affairs consultant to the Republican candidate, Gov. Thomas E. Dewey of New York, he attended the United Nations Conference in San Francisco as an adviser to the United States delegation. In September and October 1945 he accompanied Secretary of State James F. Byrnes to the Big Four Council of Foreign Ministers in London.[1] By now a symbol of bipartisanship in foreign affairs, Dulles was appointed by President Truman to act as an alternate delegate to the first U.N. General Assembly, which convened in London in January 1946. He subsequently served as a delegate to the General Assembly in New York in 1946, 1947, and 1950, and in Paris in 1948. During the latter session he was named acting head of the United States delegation, temporarily replacing the ailing Warren R. Austin.

In 1948, making his second unsuccessful bid for the presidency, Governor Dewey again chose Dulles to be his foreign affairs adviser. On July 7 of the following year, after Robert F. Wagner, Sr., resigned as senator from New York because of illness, Dewey appointed Dulles to fill the unexpired term. That November, in his only attempt to win elective office, the Republican foreign affairs expert lost his Senate seat to the Democratic nominee, Herbert H. Lehman. In 1950, shortly after his appointment on April 6 as adviser to Secretary of State Dean Acheson, Dulles was given the rank of ambassador at large and assigned to negotiate a peace treaty with Japan. This mission, regarded as a masterpiece of diplomacy, culminated in the signing of the treaty on Sept. 8, 1951, at San Francisco.

Dulles continued in the State Department until March 1952, when he resigned so that he would be free to criticize the administration's conduct of foreign affairs and write the foreign policy plank for the Republican Party's 1952 national convention platform. During the presidential campaign that followed, he served again as Republican foreign policy adviser and began his long and close association with the party's nominee, Dwight D. Eisenhower, who, after his election in November 1952, appointed Dulles secretary of state.

During his more than six years in the Eisenhower administration, from Jan. 21, 1953, until his resignation on April 15, 1959, Dulles was faced with some of the most perplexing international problems ever to confront a secretary of state. These included the Korean armistice of 1953; the cease-fire agreement in Indochina in 1954; the establishment of the Southeast Asia Treaty Organization (SEATO) in 1914; the prolonged Chinese Communist action against Taiwan, beginning in 1955; Egyptian nationalization of the Suez Canal in 1956, and the subsequent Israeli-British-French action against Egypt; the Hungarian revolt in 1956; the continuing attempt to reach disarmament and atomic control agreements with the Soviet Union; the Middle East crisis of 1958 in Iraq and Lebanon; and, beginning in 1958, the Soviet threat against the Western position in Berlin. His work took him to many parts of the world; by the time he left the cabinet he had traveled more than 500,000 miles.

On Nov. 3, 1956, Dulles underwent an operation for cancer of the abdomen. On Feb. 13, 1959, during an operation for hernia, further cancerous growth was noted; and on April 16, after the failure of radiation therapy to check the spread of the disease, President Eisenhower regretfully accepted his secretary of state's resignation. On May 20, four days before his death, Dulles was awarded the Medal of Freedom. He was given an official funeral on May 27, and was buried with military honors at Arlington National Cemetery.

Dulles was the author of two books: *War, Peace, and Change* (1939) and *War or Peace* (1950). He was married to Janet Pomeroy Avery on June 26, 1912. Their children are John Watson Foster Dulles, an engineer; Lillias Pomeroy Dulles (Mrs. Robert Hinshaw); and (Charles) Avery Dulles, a Roman Catholic priest.

* * * *

A short-range assessment of John Foster Dulles' policies and career suggests that his page in history will be large and that he may well prove to be a more controversial secretary of state than any of his 50 predecessors.

The key elements of Dulles' policies were: no appeasement of potential aggressors; the maintenance of deterrent military power; the settlement of international disputes through international law and justice; international change by peaceful means; a recognition of the interdependence of nations; economic development and technical assistance to underdeveloped countries; and a belief in the power of moral conduct, along with a tendency to define political power in moral terms.

An overriding element of Dulles' foreign policy was his unshakable conviction that the United States should stand ready at all times to put the full force of its power behind any free country menaced by aggression. Acting on his belief that there could be no compromise if aggression threatened, he supported the dispatch of American troops to the Middle East in July 1958, when Communist internal subversion was menacing the government of Lebanon. Furthermore, he recommended firm support of the Nationalist Chinese in their defense of Quemoy and Matsu during the intensive shelling of these islands by the Chinese Communists in 1958.

Under the doctrine of deterrent power, first announced by Dulles on Jan. 12, 1954, before the Council of Foreign Relations, the United States must maintain "a great capacity to retaliate, instantly, by means and at places of our own choosing," with atomic weapons constituting the mainstay of the West's defense against attack. Although this policy required a strong military establishment capable of "massive retaliation" if challenged, it did not, in the Dulles view, arise out of a competitive desire to be superior in armaments at every point, nor should it be construed to mean that military or negative considerations should dominate our foreign policy. It was Dulles' belief that, behind this shield of massive deterrent, the United States would remain secure until Communist power, doomed by its inherent immorality, had crumbled.

Secretary Dulles stood stoutly for an adequate body of international law. In his last major address, delivered before the New York State Bar Association on Jan. 31, 1959, he gave his formula for preserving the peace: ". . . a system of order based upon the replacement of force by community justice, reflecting moral law." He went on to say that the United States was examining its relationship to the International Court of Justice ". . . with the view of seeing whether ways and means can be found to assure a greater use of that court by ourselves and, through our example, by others."

In his New York State Bar Association address, Dulles elaborated also on his doctrine of peaceful change. "What is vital . . . is to recognize that the renunciation of force . . . implies not the maintenance of the *status quo* but peaceful change. World order cannot be insured merely by the elimination of violence. There must be processes of

[1] This was the first of four such meetings that Dulles attended as Republican adviser to secretaries of state in President Truman's Democratic administration. He was also present at Big Four foreign ministers conferences in Moscow, 1947; London, 1947, and Paris, 1949.

WIDE WORLD

Various stages in the life of the late John Foster Dulles are represented in these portraits. From left to right he is shown as: a boy of three in 1891; a student at Princeton University in the early 1900's; a delegate to the Versailles Peace Conference, at age 31; a senator from New York in 1949; secretary of state in December 1958, on the eve of a Western foreign ministers meeting in Paris. Disabled by cancer, he resigned his cabinet post on April 16, 1959. He died in Washington on May 24.

peaceful change whereby justice manifests itself." To implement these processes, Dulles believed firmly in the United Nations and the principles of its Charter—a document to which his draftsmanship materially contributed.

Dulles' recognition of the interdependence of nations led him to advocate the sharing of markets and trade by friendly nations and an easing of the impediments to the free flow of trade.

In the belief that two thirds of the world's people who resist communism exist in a serious state of impoverishment, Dulles continually advocated that it was the responsibility of the United States and other wealthy free nations to assist these underdeveloped countries to higher standards of living. This help was to take the form of technical assistance, loans, and investment capital, all of which were to be offered as an assurance that the free world might become a hopeful and vigorous community of nations—a world in which each nation could eventually find it possible to earn its own way and pay its own keep.

The final and all-pervasive facet of Dulles' policies was his faith in the power of rectitude and his tendency to characterize political power in moral terms. "Communism is stubborn for the wrong," he declared in November 1958, before the World Order Study Conference of the National Council of the Churches of Christ in America; "let us be steadfast for the right. . . . So it is that, while we seek to adapt our policies to the inevitability of change, we resist aspects of change which counter the enduring principles of moral law."

During his first four years in office, Dulles was given to making offhand comments, whose popularization and misrepresentation often served as oversimplified texts for American policy. (Later, the Dulles language showed more forethought, but his convictions and policies remained unbending.) Such a statement caused one of the principal controversies during his tenure as secretary of state. In an article published in *Life* magazine on Jan. 16, 1956, Dulles was quoted as saying that three times —in Korea, Indochina, and Taiwan—the United States had "walked to the brink" of war to convince aggressors of the seriousness of its intentions. In the same article he was represented as saying that "the ability to get to the verge without getting into the war is the necessary art" of diplomacy. This attitude, said his critics, made him sound like a reckless adventurer and could easily plunge the nation into war. However, Dulles defended "brinkmanship" (so named by his critics) by noting that looking grave danger in the face may avert it and lesser perils.

Apart from Dulles' importance as an architect of foreign policy, there is broad general agreement that he excelled in diplomacy as a draftsman of treaty language and as one of the finest negotiators of his time. Also not unimportant among his contributions was the role he played in leading many members of his own party from isolationism to the support of specific internationalist policies.

Throughout a turbulent decade of diplomacy, Dulles resolutely stood by two tenets. First, he held that great risks had to be taken to defeat the "dynamism of communism." The greatest of all risks, he said, was to do nothing, "for the dynamic always prevails against the static." He added, however, that taking risks was not an apology for recklessness. Second, he sternly believed that the immorality inherent in communism would cause the governments of Communist nations to topple. For him, communism was evil, and, therefore, compromise with it was wrong. He remained firmly optimistic to the end that communism would surely crack beneath the surge of freedom and that the forces of right would inevitably triumph.

ECUADOR. With an estimated total area of 105,000 square miles in northwest South America, the "Republic of the Equator" has a rich tropical and subtropical coastal belt (50–100 miles wide, including fertile foothill valleys), a series of lofty inter-Andean basins (the Sierra, 40–80 miles wide) and the vast Oriente jungle to the east (60–200 miles wide), as well as the bleak *Archipiélago de Colón* (Galápagos Islands) 580 miles off the coast.

The population of 4,127,000 (mid-1959 est.) has been increasing at an annual rate of 3% (1956 death rate: 15.5 per 1,000 pop.; birth rate: 46.4). The 1,600,000 Indians live for the most part outside the national society economically and politically; over 200,000 speak only Quechua or another Indian tongue. Persons of mixed race make up 41% of the population, including the prominent *montuvio* (fusion of Indian, white and Negro) of the coastal and foothill regions. Negroes and mulattoes make up 5% of the population, and whites account for less than 10%. The major port and industrial center is Guayaquil (1958 pop., 420,000); the capital is Quito (1955 pop., 237,000).

Government.—Under the 1946 constitution the president is elected directly for a 4-year term (Camilo Ponce Enríquez, inaugurated Sept. 1, 1956); 33 of the 45 senators (4-year terms) are popularly elected, while 12 represent the following "functions": public education, private education, learned academies and journalism, and the armed forces; Sierra agriculture, commerce, labor, and industry; and coastal agriculture, commerce, labor, and industry. The Chamber of Deputies has 71 members elected for 2-year terms (1 for every 50,000 persons; minimum, 2 per province). All literate citizens over 18 have the franchise, voting being compulsory only for men.

Education and Religion.—During 1956–57, 558,889 students (105,063 in private schools) were enrolled, including 5,859 in higher education (state universities are at Quito, Guayaquil, Loja, Cuenca and Portoviejo). Because of inadequate facilities, fully one third of the children between 6 and 12 do not receive "free and compulsory" elementary education. Literacy is less than 50%.

Roman Catholicism is the dominant religion, but there is separation of church and state and freedom of worship. When the Catholic bishops in April 1959 prohibited the "purchase, reading, distribution or possession" of *La Calle*, a left-of-center weekly, on pain of mortal sin, deep anticlerical feelings were aroused; prominent Catholics, among others, deliberately defied the ban.

Finance.—The sucre, since December 1950 officially 15 to the dollar, was exchanged on the free market in August 1959 at 18.05, weakening from 16.66 in December 1958. Gold and foreign exchange reserves, up to $39.1 million in 1957, held at $35.3 million as of July 1959. The cost-of-living index (1953 = 100) went only to 104 by June 1959 (December 1958, 103). More than 600 public agencies have varying degrees of independence in budgetary matters, often collecting taxes or spending earnings without normal controls. In 1955 service on public debt and remittances on private investment used over 17% of total foreign exchange earnings.

Transportation and Communications.—The State Railway Company operates 5 lines of 2 different gauges (30 inches and 42 inches); routes total 696 miles. There were 6,200 miles of roads (all-weather, 3,400 miles) in 1956, mostly unpaved and single lane. Vehicle registrations totaled 22,422 (trucks 72%, buses 13%), of which 43% were five or more years old. A $4.7 million loan from the U.S. Development Loan Fund in December 1958 should enable Ecuador to complete the final 125-mile link from Loja to Macará in the Pan American Highway and provide the first land communication between Ecuador and Peru. A $5.3 million loan is being made by the same fund for the construction of a 148-mile road between Quito and Quevedo. The World Bank will lend an additional $11 million for this project, aimed at linking the capital and Guayaquil by means of a first-class road. Oceangoing ships must use lighters, since there are no berths at any of Ecuador's 10 ports; but the construction contract for a modern port for Guayaquil was let in July 1959. Numerous local aviation concerns (the largest of which is Aerovias Ecuatorianas) and Panagra provide service within the country. Panagra and other international lines connect with the outside world. The airports both at Guayaquil and at Quito accommodate DC-7 type aircraft as a result of recent modernization. Telephones in Ecuador numbered 22,000 in 1958. There are 90 radio stations in 20 centers, mostly small and privately operated except for 10 owned by various levels of the government. World Radio Mission Fellowship (Protestant) operates a powerful transmitter of 50,000 watts.

Agriculture and Industry.—Over 60% of the economically active population (1,182,000 in 1950) works in mining, agriculture, or forestry; 20% is engaged in manufacturing, utilities, construction, and transport. Most of the population is seriously underemployed. Only 4.5% of the land is under cultivation; 4% is in pasture. Absentee landlordism is a major problem; 1% of all rural proprietors hold 39% of the land, by value.

The cacao crop for 1958–59 was estimated at 29,000 metric tons (4,000 tons above 1957–58). Exportable coffee totaled 500,000 bags in 1958–59 (465,000 in 1957–58). Prices for both products declined, however. Banana shipments for 1959 promised to surpass the 38 million stems of 1958. Other important crops are corn, potatoes, wheat, barley, and beans. There is a growing dairy industry. Rice, citrus fruit, sugarcane, and cotton are grown on the wet lowland; grapes, avocados, and mangoes grow in the intermediate valleys. Ecuador produces 90% of her own food.

The gross national product rose to 11,651 million sucres in 1957 (1956, 10,897 million) but real per capita annual income has not improved since 1954, when it was $133, because of the population increase and price rises. Business recovered slowly from the 1958 recession, partly because of tight credit. Crude petroleum output fell in 1958 to 405,600 metric tons (1957, 421,200); cement production in 1958 was 159,600 tons (1957, 154,800). The textile industry employs 5,300 workers in 25 mills; fabric quality is not high and imports fill 40% of the domestic market. The Koppers Company of Pittsburgh agreed in May 1959 to build a $10 million steel mill near Guayaquil, utilizing iron-ore-bearing sands and the new Strategic-Udy process; by 1961, 33,000 tons of finished steel are scheduled (about 50% of domestic requirements).

Foreign Trade.—Exports expanded again to $137 million in 1958 ($132.6 million in 1957). Bananas, with 9% greater production volume, earned a share even larger than usual ($76.7 million, compared with $69.1 million in 1957); coffee, in spite of a 5% increase in volume, earned but $26.2 million ($29.9 million in 1957); cacao, with a 16% decrease, brought $20.7 million ($19 million in 1957); and rice, off 24% in volume, was valued at $3.4 million ($4.9 million in 1957). Other exports are Panama hats, tagua nuts, castor beans, and balsa. Imports were restricted in 1958 to $87.2 million ($88.8 million in 1957), consisting chiefly of textiles, vehicles, machinery, high-grade cotton, and chemicals. Exports to West Germany rose

from $25.8 million in 1957 to $35.8 million in 1958; in the same period exports to the United States declined from $58.1 million to $56 million. Total exports in the first half of 1959 amounted to $64 million, compared with $56.7 million for the same period in 1958. Trade agreements were signed in 1959 with Yugoslavia and France, and Czechoslovakia and Japan sent trade missions.

Principal Events, 1959.—Preliminaries for the 1960 presidential campaign (elections are scheduled for June) were in full swing. In March 1959, former president José M. Velasco Ibarra became the first to enter the race. To block Velasco Ibarra, liberal and leftist elements, including the Communists, appeared anxious to combine their efforts; President Ponce, a conservative, had been able to win in 1956 only because the left was badly split. In June another former chief executive, Galo Plaza Lasso, made known his willingness to head a slate against Velasco Ibarra. The president asked suspension of all campaigning during February 1960, when Quito will be host to the 11th Inter-American Conference.

Argentine, Chilean, Brazilian, and United States representatives met in Rio de Janeiro, Brazil, in February to discuss the boundary dispute between Peru and Ecuador, once again a sensitive issue. The portion in dispute is some 50 miles long but involves the determination of a *divortium aquarum* (line between watersheds) which Ecuador insists does not exist. On the promise of bringing the matter before the Inter-American Conference, Julio Moreano Espinosa won the mayoralty election in Quito on November 1.

On March 8, 23 Italian settlers initiated a major colonization effort to bring 300 families in 5 years to the newly opened region around San Lorenzo, in Esmeraldas Province.

Ecuador and Colombia took steps in August to deal with the burgeoning contraband trade across their common frontier by signing agreements for freer trade, balance of payments, and general economic cooperation.

ROBERT D. HAYTON,
Assistant Professor of Political Science, Hunter College.

EDUCATION. Integration.—In 1959 Virginia's program of "massive resistance" to public school integration was broken, a development which some observers considered to be a turning point so far as the future course of opposition in the South was concerned.

Court orders to admit Negro students in the fall of 1958 had resulted in the closing, by state law, of a total of nine schools in Charlottesville, Norfolk, and Warren County that previously enrolled some 12,700 white students. When appeals to state and federal courts for further delay were to no avail, seven Virginia public schools—six in Norfolk and one in Arlington County—began the second semester on an integrated basis. Thus, on Feb. 2, 1959, segregation ended in some public schools of Virginia. Twenty-one Negro pupils—17 in Norfolk and 4 in Arlington—entered their respective schools without incident. In Arlington an effort to get white pupils to boycott the school failed completely.

In January 1959, Gov. J. Lindsey Almond, Jr., told a special session of the state legislature that all efforts to maintain segregation had been exhausted and that some integration was inevitable. He proposed a program designed to lessen the impact of desegregation. After considerable opposition from die-hard segregationists, the governor's program was adopted. The state compulsory school attendance law was repealed. A $3 million fund was earmarked for tuition grants—not to exceed $250 per child—to be paid on request of the parents to permit their children to attend private schools.

Warren County High School, the first school in Virginia to be closed, reopened on February 18 with an enrollment of 21 Negro students. Not a single white student enrolled, although over 1,000 pupils had been attending when the school was closed. Segregationists hailed the action as evidence of all-out resistance to integration. Others ascribed it to an unwillingness to interrupt in midyear the education of the 780 pupils attending the segregated classes conducted privately by the Warren County Educational Foundation.

With the opening of schools in September 1959, integration began, without incident, for the first full session. In Charlottesville, 12 Negro students enrolled in Lane High School and Venable Elementary School. In Arlington County there were 23 Negro pupils in three schools; in Norfolk, 22 in seven schools; in Alexandria, 9 in three schools; and at Warren County High School, 20. In all, by October a total of 86 Negro pupils and 20,327 white children were jointly attending 16 of Virginia's 2,600 public schools.

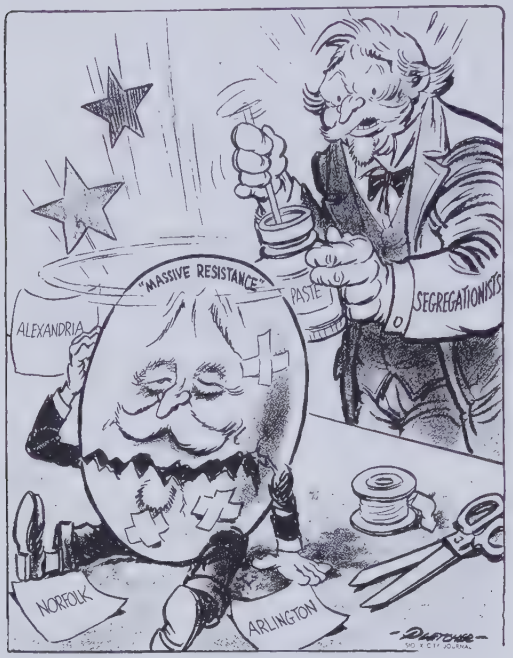
In Warren County the community was divided over whether white children should attend the Warren County High School on an integrated basis or continue in the segregated private school operated by the Warren County Educational Foundation, for which a tuition charge of $220 per pupil was made. When classes began in September 1959, 433 pupils were enrolled in the private school. In Warren County High School the enrollment was 415, including 20 Negroes.

In Prince Edward County, where over 50% of the school population is Negro, drastic steps were taken to prevent integration. Under a federal court order to desegregate with the opening of schools in September 1959, the county Board of Supervisors refused to appropriate funds for the operation of public schools. With this abandonment of public schools in the county, approximately 1,700 Negro children were left without educational facilities. Negro leaders agreed that there was not enough money among their people to operate private classes. Only a few children were attending school elsewhere. The 1,500 white children were attending private segregated classes operated by the Prince Edward School Foundation in 16 buildings, most of them churches. All but two of the foundation's 66 teachers had taught in the county's public schools the preceding year, and were being paid the same salaries. The closing of the public schools left the county's 70 Negro teachers without jobs. Some moved; others commuted to teach elsewhere; and still others took other types of positions.

In Arkansas nine of the state school districts were integrated as the 1959–60 school year started. In Little Rock the four previously closed public high schools reopened at the early date of August 12, with the two integrated schools given local police protection. After three dynamite blasts were set off on the night of Labor Day, one of them damaging the School Board office, police patrolled the streets. Within three days five men were arrested. The integrated schools continued to operate.

Desegregation came to Florida in the fall of 1959 when 25 Negro students in Dade County started to school with approximately 750 white children at two schools—Orchard Villa Elementary School in Miami and the Air Base Elementary School at Naranja, near Homestead Air Force Base.

In Delaware the first statewide "stairstep" desegregation plan to win federal court approval be-



PLETCHER IN THE SIOUX CITY JOURNAL

"SPEAK TO ME!"

gan operation in September 1959 with the desegregation of the first grade. The process will take 12 years.

In North Carolina seven districts were operating with desegregated schools; in Tennessee, four. Only in Alabama, Georgia, Louisiana, Mississippi, and South Carolina were there no desegregated school districts. In Georgia, private school enrollments were booming in the Atlanta area. The Atlanta Board of Education was under court order to present an integration plan by Dec. 1, 1959. Under state law, integrated schools must be closed.

In 1959 there were 7,781 school districts in the 17 states and the District of Columbia which had maintained segregated schools prior to the U.S. Supreme Court's segregation decision of 1954. Of the total number of districts, 2,880 were biracial, and in 762 of these there was some degree of integration by October 1959.

At the college level, desegregation continued to expand in 1959, although slowly. Negroes in larger numbers were being accepted in formerly all-white colleges and universities in the South. Several formerly all-Negro institutions were enrolling white students, as, for example, in West Virginia.

Impassive as white students shout gibes at him, a Negro youth awaits transportation after attending a session at Central High School in Little Rock, Ark. Two of the city's high schools reopened on an integrated basis on August 12.

UPI

School Enrollments.—For the 15th consecutive year, school and college enrollments in the continental United States, excluding Alaska, showed an increase, according to the U.S. Office of Education. The 1959–60 estimated full-time enrollment reached an all-time high of 46,480,000, a rise of 1,940,000 over the 44,540,000 enrollment for the session of 1958–59, and was distributed as follows:

	Kindergarten through grade 8	Grades 9 through 12	Total
Public schools	27,890,000	8,100,000	35,990,000
Nonpublic schools	5,400,000	1,050,000	6,450,000
Other schools	170,000	90,000	260,000
Higher institutions, degree-credit	...	...	3,780,000
Total	33,460,000	9,240,000	46,480,000

Enrollments in kindergarten through grade 8 increased 4.5% over that of the previous session; in grades 9 through 12, 3.5%; and in institutions of higher learning, 5.3%. For nonpublic schools alone, the percentage increase in full-time students was 6.7 for kindergarten through grade 8, and 4.0 for grades 9 through 12.

The increase in the nation's school and college enrollments in a generation is impressive. Between 1929 and 1959, elementary school enrollments increased from 23,740,000 to 33,460,000, a climb of over 40%; secondary school enrollments, from 4,812,000 to 9,240,000, a rise of 92%; and college and university enrollments, from 1,101,000 to 3,780,000, a leap of nearly 250%.

School enrollments will continue to rise. The Research Division of the National Education Association (NEA) estimates that between 1950 and 1965 the number of pupils attending elementary school will have increased 63%, while the number attending high school will have increased 92%. In 1900, 11.4% of the youth of high school age (14–17) were enrolled; in 1930, the percentage was 51.4; and in 1958, it had risen to 82.2.

The percentage of youth of college age (18–21) attending college has risen just as strikingly. In 1900, 4.0% were enrolled; in 1930, 12.2%; and in 1958, 38.6%. Enrollments in higher education by 1975 may comprise 6 million students if the present ratio of youth attending college persists. Enrollment may reach 7,250,000 by 1970 if the proportion attending college increases as it has for the past ten years.

Supply of Teachers.—In 1959–60 an estimated 1,563,000 teachers were needed for the public and nonpublic elementary and secondary schools of the continental United States, of whom 70,000 were required to meet enrollment increases alone. Qualified teachers of the preceding year (1958–59) returning to classrooms totaled 1,248,000; newly trained teachers entering the profession approximated 97,000; and teachers with substandard preparation becoming fully certificated numbered 23,000. Thus a total of 1,368,000 qualified teachers were available for 1,563,000 positions.

The shortage of 195,000 teachers for 1959–60 had to be met by employment of teachers with substandard credentials (there were 92,300 such personnel in 1958–59), the re-entrance of former teachers into the profession, further overcrowding of classes, or curtailment of the curriculum.

The shortage of qualified teachers is intensified by the number who leave the profession each year (currently estimated at 10.9%) and by the inadequate number of qualified new teachers entering the profession as replacements.

Certification Requirements for School Personnel.—As of July 1, 1959, 40 states required a college degree for regular certification of beginning elementary teachers, according to a report by the National Commission on Teacher Education and Professional Standards, NEA. Kansas, West Virginia, and Wyoming are the most recent additions to the list. Arkansas and Iowa have announced that the degree requirement will become effective in 1960.

In 1937 only six states required a degree for elementary teachers; by 1946, there were 14; in the 13-year period that followed, 26 states set up the degree requirement.

All states but one (Arkansas, which will begin doing so in 1960) now require a degree for all high school teachers. Arizona, California, and the District of Columbia require five years of preparation for beginning high school teachers. New York dropped the five-year preservice requirement on Sept. 1, 1958, but requires the completion of the fifth year within five years after initial teaching has begun. Four other states (Connecticut, Indiana, Oregon, and Washington) require a fifth college year of preparation for elementary and/or secondary teachers after a specified number of years of teaching.

Standards for administrative certificates have also been stiffened. Three states (California, Indiana, and Washington) now require six years of college preparation for superintendents' certificates; four require in excess of five years; 35 require the master's degree or five years; five require in excess of the bachelor's degree; three require the bachelor's degree; and two (Florida and Michigan) do not issue such certificates.

For elementary principals, 28 states require five or more years of college preparation, while 13 others require more than a bachelor's degree; for secondary principals, 35 states require five or more years, while 11 others require in excess of the bachelor's degree.

As an effect of recent criticism of teacher education and certification requirements, 33 states reported intensive restudy of certification under way in 1959.

Adult Education.—The expansion of adult education programs in the United States is a striking phenomenon of the mid-20th century. It is estimated that 35 million adults are attending classes, 4 million of whom are in public schools.

Adult education is difficult to define because of its breadth and variety. The U.S. Office of Education lists the following criteria for classifying persons as engaged in such a program: (a) they are beyond the compulsory school age; (b) they are engaged in an organized educational activity conducted by a responsible educational agency; (c) they are continuing their education on a part-time basis; and (d) they are attending classes voluntarily.

In October 1957 the Bureau of the Census obtained statistical data on participation in adult education as a part of its current population survey. The results, published in *Participation in Adult Education* (Washington 1959), Circular No. 539 of the U.S. Office of Education, are believed to be highly conservative because of the limitations of a sampling technique, the difficulty of recalling data for each member of the family, the time span involved, and other factors. This sampling indicated that at least 8,270,000 persons, or 7.8% of the adults in the United States, had participated in adult education classes during the preceding year. An additional 942,000 persons were attending school or college part-time, or otherwise participating in adult education programs, so that a total of 9,212,000 participants was indicated. Persons engaged in correspondence courses or on-the-job training were not included in the count.

WIDE WORLD

Scene on opening day (August 12) at Central High School, Little Rock. Police escort one of several persons taken into custody when disturbance broke out at school grounds.

By type of activity, these adults were enrolled as follows: elementary and high school classes, 183,000; part-time college or university programs, 710,000; civic and public affairs classes, 1,043,000; general education, 1,178,000; home and family living, 991,000; Americanization, 107,000; trade, business, and technical, 2,611,000; agricultural courses, 352,000; recreational skills, 921,000; and other, 1,116,000.

By sponsoring agency, the public elementary and high schools and the colleges and universities offered classes that respectively enrolled 21.6% and 16.8% of the persons participating in adult education programs. Community colleges enrolled 4.9%; private trade or business schools, 10.9%; agriculture extension services, 4.1%; libraries, 0.3%; employers or unions, 9.1%; group-work agencies (YWCA, YMCA, Red Cross, and others), 12.3%; and others not classified, 20.0%.

The median age of the participants was 37.6 years, and the median years of school completed was 12.6 years. The West had the highest rate of adult education participation (1 out of 7). Two thirds of the persons participating lived in urban areas, reflecting the urban-rural distribution of the population, 64% of whom were classified in 1950 as living in urban areas. Forty-seven per cent of the participants were men, and nearly 75% of the women participating were married.

Additional data on the extent of adult education and its growth are obtainable in an Office of

These five Negro pupils were among 17 who entered previously all-white schools in Norfolk, Va., February 2. By October, 86 Negroes had enrolled in integrated schools in the state, as Virginia's "massive resistance" plan collapsed.

UPI

Education survey entitled *Adult Education Services of State Departments of Education* (Washington 1959).

Vocational Education.—The vocational educational program is designed to fit persons for useful employment. It serves both those who have begun work and those who are preparing for certain occupations. In 1958 there were 3,629,339 persons enrolled in vocational classes, distributed as follows: agriculture, 775,892; home economics, 1,559,822; trades and industry, 983,644; distributive occupations, 282,558; and practical nursing (authorized in 1956 under the George-Barden Act), 27,423. This enrollment was the largest since the passage in 1917 of the Smith-Hughes Act providing funds for the improvement and promotion of vocational education.

By type of program, there were 1,577,178 persons enrolled in evening classes, 387,752 in part-time classes, and 1,664,409 in day classes. The teaching staff in 1958 numbered 37,647 for evening classes, 13,342 for part-time classes, and 36,832 for day classes.

Expenditures for vocational education in 1958 totaled $209,748,084.15, of which $38,733,173.68 came from federal funds, $72,305,243.08 from state funds, and $98,709,667.39 from local funds.

Expenditures for Education.—According to statistics compiled by the Research Division of the NEA, the instructional staff in the nation's public schools in 1958–59 numbered 1,395,940, an increase of 50% in ten years, during which time the school enrollment increased an average of one million pupils a year.

The average salary of all instructional staff members in 1958–59 was $4,935, an increase of 4.6% over the previous year's average. Salaries ranged from an average of $5,992 in the Far West to $3,882 in the Southeast. The average salary of elementary classroom teachers was $4,575; of high school teachers, $5,110.

Total expenditures for current expense, capital outlay, and interest were estimated at $14,373,638,000 in 1958–59, an increase of 9.6% over the previous year. More than $10 billion of this total was for current expense, which has increased an average of 9.8% a year since 1948–49 for a total increase of 152.6%. The expenditure per pupil in average daily attendance was $340 in 1958–59, an increase of 72% since 1948–49.

For the first time the NEA included Alaska in its statistical report. In the 49th state 40,000 pupils were enrolled in public schools in 1958–59. The 1,775 instructional staff members were paid an average salary of $6,500, which was about $1,500 more than the average for the other 48 states included in the report.

In Alaska, current expense per pupil in average daily attendance was $520. Of the $20,500,000 in revenue receipts, 50% was contributed by the state, 15% by the federal government, and 35% by the local school district.

National Defense Education Act.—The passage of the National Defense Education Act of 1958 has been acclaimed as a recognition of the vital role played by education in the strength and security of the American people.

As of July 1959, the Office of Education had distributed $30,617,337 in federal funds to 1,192 colleges and universities for student loan purposes under Title II of the act. This total included $117,337 in special interest-bearing loans to institutions unable to provide their $1 share for every $9 in federal funds.

In 1959–60 the number of participating colleges and universities increased to 1,370. It was estimated that nearly 121,000 students (approximately 5.5% of the enrollment in the participating institutions) would apply for loans at an average of $500 each.

Institutional allocations were made on the basis of approximately $20 per full-time student enrolled. On Sept. 15, 1959, the Office of Education announced a distribution of an additional $30 million to 1,184 institutions for student loan purposes in 1959–60. The other 186 colleges will use funds from previous allocations. The participating institutions had on hand some $15 million from amounts already allocated to them late in the 1958–59 session.

Thus, as of September 1959, approximately $60,500,000 in federal funds, plus $6,700,000 contributed by the participating institutions, had been made available for student loan purposes since February 1959. Institutions enrolling nearly 88% of the full-time college students in the country were participating.

Title III of the act provides financial assistance, on a 50–50 matching basis, for strengthening instruction in science, mathematics, and modern foreign languages, especially in terms of equipment and supervision.

As of July 1959, $32,617,341.26 for equipment and minor remodeling and $1,130,756.40 for supervision and administration had been made available, under approved plans, to 44 states and 4 territories. In addition, loans totaling $1,104,919 had been approved for 88 private nonprofit elementary and secondary schools.

Under Title IV, designed to increase the number of college and university teachers, $5,300,000 was expended in the fiscal year 1959 to provide 1,000 graduate fellowships. For 1959–60 the Office of Education had approved 272 new or expanded graduate programs in 123 institutions of higher learning selected from a total of 1,038 programs proposed by 168 institutions. On Aug. 12, 1959, the Office of Education announced the names of the recipients of 997 graduate fellowships for 1959–60.

Under the provisions for guidance, counseling, and testing, plans for programs in 50 states and territories have been approved. Moreover, 50 counseling and guidance training institutes were in operation in college or university summer sessions in 1959, with a total enrollment of 2,118 persons. Seven institutes were operating in the 1959–60 academic year.

The summer institute program, operated at a cost of $2,225,000, concentrated largely on training secondary school personnel already engaged in counseling and guidance. The regular session institutes, for which approximately $1 million had been authorized, were giving more emphasis to the training of persons with little or no experience in guidance.

Present plans are to have 93 additional institutes in operation during the 1960 fiscal year, 67 of which would be held during the 1960 summer session and 26 during the 1960–61 academic year.

Title VI of the act authorized appropriations for foreign language centers, fellowships, and research. By July 1959, 19 centers had been established for teaching languages not commonly taught in the United States (including Bengali, Marathi, Swahili, Thai, and others). Fellowships were awarded to 171 graduate students for advanced study in critical languages. Twelve summer modern language institutes were operated in 1959 with an enrollment of 1,050 teachers of foreign languages. Twenty research projects, including a three-year survey of all aspects of language instruction in the United States, were contracted for, with an initial appropriation of $2,500,000.

Under Title VII the Office of Education has approved 68 research grants and 14 contracts related to research and experimentation in the use of new educational media.

The Area Vocational Training Program, authorized under Title VIII, involves the expenditure of approximately $3,750,000 in 1959 and $7 million in 1960 for programs to provide training of less than college grade in highly technical skills essential to the national defense effort.

College Teachers.—In June 1959 the Research Division of the NEA published a comprehensive survey of teacher supply and demand in 1,350 colleges, universities, and junior colleges. Only 23.8% of the new college teachers employed in 1958–59 had earned a doctor's degree, as compared with 31.4% in 1953–54. In 1953–54, 40.5% of the total faculty held the highest earned degree. Some 20.8% of the new college teachers in 1958–59 had less than a master's degree, although only 10.4% of the total faculty had such preparation in 1953–54.

While vacancies are widespread among the teaching fields, the most critical shortages are in the sciences and mathematics. A total of 253 unfilled positions in the physical sciences were reported by 198 institutions, and 162 in mathematics by 118 institutions.

While higher institutions, especially the public universities, indicate a willingness to employ more women, particularly in mathematics and the physical sciences, the number of available candidates is limited. Approximately a fourth of the college teaching load is carried by women.

In 1958, 365,748 bachelor's degrees were conferred, of which 33.6% went to women. At the master's level 32.6% of the 65,614 degrees were received by women. Only 10.8% of the 8,942 doctor's degrees were earned by women. Two thirds of the 964 doctor's degrees awarded women were in four fields: education (341), biological sciences (138), social sciences (96), and psychology (84). There were only 9 doctor's degrees in physics and 15 in mathematics.

College Salaries and Fees.—In 1958–59 the average salary paid faculty members in four-year colleges and universities was $6,630, an increase of 7.6% over the previous year. By ranks, the average salary and percentage increase were as follows: professors, $8,840 (10.4); associate professors, $6,920 (7.5); assistant professors, $5,860 (6.2); and instructors, $4,840 (5.0).

By type of control, the average salary in 1958–59 for all ranks combined was $6,780 in public four-year institutions, an increase of 4.8% over the previous year, and $6,350 in private institutions, an 11.4% rise.

Tuition fees increased an average of 5.8% in public institutions and 9.5% in private institutions between 1957–58 and 1958–59, according to Office of Education reports.

Science and Mathematics Majors.—There was an increase of 31% in the number of college juniors enrolled as majors in mathematics in 1958–59, as compared with 1957–58, according to an Office of Education survey. This compared with an overall 3.8% rise in junior-class enrollment. Smaller but significant percentage increases were reported in the biological and physical sciences. It is estimated that over 45,000 bachelor's degrees in mathematics or science will be awarded in 1959–60, as compared with 37,315 in 1957–58.

In engineering courses, total enrollment dropped by 2.4%, from 297,077 to 289,927, between 1957–58 and 1958–59. Freshman engineering enrollment dropped sharply, by 11%, but enrollment in graduate courses rose 16.3%.

College Housing.—On Sept. 23, 1959, President Eisenhower signed the Housing Act of 1959, which included a provision authorizing loans to colleges totaling $250 million, comprising $200 million for dormitories, $25 million for dining halls and related facilities, and $25 million for housing for nurses and internes. (See also HOUSING.)

Teacher Exchange Program.—In 1959–60, 564 teachers from the United States and 39 other countries participated in the exchange program administered by the U.S. Office of Education. Nearly 5,000 teachers from a total of 65 countries have shared in the program since its inauguration in 1945. The largest single group of American teachers (100) exchanged positions with teachers in the United Kingdom.

Students from Abroad.—In 1959 there were 47,245 students from 131 countries registered in American colleges and universities, an increase of 9% over the previous year. The number has increased 38% in the last five years, according to the Institute of International Education.

In 1959 there were 1,937 foreign faculty members teaching in American universities, as compared with 1,842 American faculty abroad. Forty-five per cent (907) of the foreign professors taught the physical sciences.

The largest number of foreign students were from the Far East (15,823); Latin America, with 10,249, was second. The rapidly developing Middle East sent 6,619 students, thus for the first time outranking Europe, which sent 6,601.

Engineering, with 23% of the students, continued to be the most popular field of study. The humanities again was second, with 20% enrolled.

The University of California had the largest number of foreign students. The Massachusetts Institute of Technology recorded the highest percentage of foreign students (12% of its total enrollment), and the largest number of foreign faculty members (198).

EISENHOWER, Dwight David, 34th president of the United States: b. Denison, Texas, Oct. 14, 1890. The seventh year of President Eisenhower's administration may be recorded as one in which he assumed unmistakable control of the chief executive's office. It may be remembered also as the year when he fulfilled as never before the role of champion and spokesman of the free world. His international prestige at an all-time high, his health again robust, his spirits buoyant, and his attitude self-assured, the president largely confounded his political opposition while at the same time confronting the Communist world with firmness and resolution. Above all, in 1959, Eisenhower emerged in the eyes of the world as the man of peace, climaxing an eventful year of vigorous, personal diplomacy with a 22,370-mile, 11-nation tour that won him tumultuous acclaim on three continents. If, as some critics claimed, he had not provided genuine leadership, he did in 1959 provide a new image of leadership both at home and abroad; and if he offered no bold, new, imaginative approaches to global problems, his declara-

tions did command new respect and response throughout the world.

Reared in Abilene, Kans., Eisenhower entered West Point in 1911 and was graduated and commissioned a second lieutenant in 1915. During World War I he served as an instructor in various Army camps and as commander of Camp Colt, Gettysburg, Pa. Subsequently, he was graduated from the Infantry Tank School (1921), the Command and General Staff School (1926), the Army War College (1928), and the Army Industrial College (1933). Between 1929 and 1935 he was assigned to the offices of the assistant secretary of war and of the chief of staff, and from then until 1939 he served as assistant to Gen. Douglas MacArthur in the Philippines.

On Sept. 29, 1941, Eisenhower was appointed to the temporary rank of brigadier general. In February 1942 he became head of the War Plans Division and, in March, of the new Operations Division of the War Department General Staff. After becoming commanding general of the European Theater of Operations in June 1942, he directed the Anglo-American assault on French North Africa in November, and on Feb. 11, 1943, was named commander in chief of all Allied forces in North Africa. Later in 1943 he led his forces into Sicily and southern Italy; and on December 24, he was named supreme commander of the Allied Expeditionary Force and went to London to direct preparations for the invasion of France on June 6, 1944. He was promoted to the rank of general of the army in December, and on May 7, 1945, accepted the unconditional surrender of Germany.

He served briefly as military governor of United States occupation forces in Germany; was named army chief of staff in November 1945; and, after taking leave from the Army in February 1948, was installed as president of Columbia University in October. From February to August 1949, on leave from Columbia, he served as temporary chairman of the Joint Chiefs of Staff, and in December 1950 became supreme commander of North Atlantic Treaty Organization (NATO) forces in Europe. Retiring from the Army in June 1952, he received the Republican nomination for the presidency in July, was elected, and took office on Jan. 20, 1953. He was re-elected by a large majority on Nov. 6, 1956, and was inaugurated for a second term on Jan. 20, 1957.

Rivaling his personal triumphs on the international scene in 1959 was the extraordinary mastery which President Eisenhower displayed over the Democratic-controlled 86th Congress. In his State of the Union message of January 9, Eisenhower laid down the principles on which his legislative program would be based: the exercise of "wisdom and prudence" to insure a strong and expanding economy, and an end to deficit government financing. This was the theme of his budget message on January 19, when he presented a budget of $77,030,000,000 in expenditures and $77,100,000,000 in revenue. In his economic message the next day, and in numerous subsequent statements, the president reiterated the importance of achieving a balanced budget, of maintaining a sound economy (which he equated with national security), and of staving off the threat of inflation.

As the session began, however, Congress appeared not at all receptive to pleas for fiscal restraint. Senate Majority Leader Lyndon B. Johnson (confident that the Democratic majority of 64–34 in the Senate and 283–153 in the House could write its own program) issued his own "state of the union" message. But Eisenhower accepted the challenge and plunged into the legislative battle with enthusiasm.

Rallying public opinion with frequent, outspoken comments, marshaling an efficient corps of Republican leaders in both houses, and wielding the veto power with telling effect, Eisenhower brought his influence to bear to such an extent that the final record of the first session reflected in many important ways the president's governmental philosophy. He did not get everything he wanted, but in the area of public spending, to which he attached foremost importance, his views largely prevailed.

Eisenhower could claim, as he did on September 19, a victory over the "big spenders" in Congress. He could claim other major victories, notably the passage of a strong labor reform bill (signed September 14) after protracted and heated controversy; and of other measures close to his original requests, such as a $1 billion housing bill (signed September 23 after two costlier bills were vetoed); a 1-cent rise in the federal tax on gasoline to help finance the national highway program (signed September 21); and an increase from 3.26% to 4.25% in the interest rate limit on Series E and H savings bonds (signed September 22).

But the president's program suffered some reversals, too. Congress trimmed his requested $3.9 billion for mutual security (foreign aid) by more than $700 million; refused to lift the interest rate ceiling on long-term government borrowing (other than two types of savings bonds); passed no major civil rights or farm legislation; refused to confirm (June 19) the nomination of Lewis L. Strauss as secretary of commerce; and forced through a $1.185 billion public works bill by breaking the president's second veto.[1]

Eisenhower was plagued in 1959 by two major problems whose solutions eluded him. The longest steel strike in history (beginning July 15) continued for more than three months before the president formally invoked the Taft-Hartley Act; although the plants reopened there was no settlement of the issues involved (see also LABOR). And he came under mounting criticism as the nation's space exploration and missile program seemed to falter. New Soviet successes and additional United States failures prompted widespread demands that the chief executive mobilize an all-out national effort in this field.

Dominating the president's year in international affairs were new efforts to achieve a "thaw" in the cold war. Most observers agreed that the resignation of the late Secretary of State John Foster Dulles (q.v.) in April and the appointment of Christian A. Herter (q.v.) resulted in more direct presidential control over foreign policy than had existed during the six-year service of the secretary on whom Eisenhower had relied so strongly. The Berlin issue (see GERMANY) remained paramount during the early months of 1959, and in this regard the president cautioned the Soviet Union on January 1 that the United States would negotiate the question only "in an atmosphere devoid of any kind of coercion and threat."

After the announcement that Soviet Premier Nikita S. Khrushchev (q.v.) would visit the United States in September (an announcement which dramatically stirred world hopes for an end to the East-West impasse), President Eisenhower left for Europe on August 26, on the first of his two major journeys of 1959. The primary purpose of the trip was to placate those western European nations which were concerned that the Eisenhower-Khrushchev talks might result in bilateral agreement on matters affecting them. In Bonn, Eisenhower assured West Germany that the United States would insist on the preservation of Allied rights in West Berlin. Full accord among Western leaders was reported following talks with West German Chancellor Konrad Adenauer (August 26–27), British Prime Minister Harold Macmillan (August 29–September 1), and French President Charles de Gaulle (September 2–3). On the 20th anniversary of the start of World War II, and at the scene of his former military command,

[1] A public works or "pork barrel" bill for $1.2 billion was first vetoed in August. Congress sent back essentially the same measure, which the president promptly vetoed on September 9; but the next day Democrats succeeded in overriding this 9th veto of the session, the first of Eisenhower's 146 vetoes to be overridden since he took office (leaving only nine presidents with perfect veto records).

Eisenhower's visit proved to be a triumphal procession through cheering throngs in Bonn, London, and Paris.

Supported by this demonstration of Allied unity, the chief executive returned to prepare for the meeting with Khrushchev. For three days beginning September 25, world attention was focused on Camp David, the president's Maryland retreat, as Eisenhower and Khrushchev explored means of ending international tensions. Reporting optimistically on the private discussions, Eisenhower called them the "beginning" of an easing in East-West relations and disclosed that the Soviet premier had precluded any threat of force on the Berlin dispute, thus removing many Western reservations toward a summit conference.

As the long-delayed Big Four summit meeting became almost a certainty for 1960, Eisenhower left on December 3 on his unprecedented 19-day journey to Asia, Europe, and Africa.[2] This trip, he said, was intended to remove any doubts concerning the peaceful aims of the United States. At a news conference on December 2, he stated:

> I want to prove that we are not aggressive, that we seek nobody else's territories or possessions; we do not seek to violate anybody else's rights. We are simply trying to be a good partner in this business of searching for peace.

After three days of talks in Rome, including a private audience with Pope John XXIII (December 6), the chief executive flew to Ankara, Turkey (December 6); Karachi, Pakistan (December 7); Kabul, Afghanistan, and New Delhi, India (December 9); and Teheran, Iran, and Athens, Greece (December 14). He then boarded the cruiser U.S.S. *Des Moines* for a voyage to Tunisia (arriving December 17) and then to Toulon, France (arriving December 18). In Paris he met with de Gaulle, Macmillan, and Adenauer (December 19–21) in the so-called Western summit conference, aimed at formulating policies for the forthcoming Big Four summit meeting. Afterward he flew to Madrid, Spain (December 21), and to Casablanca, Morocco (December 22), before leaving for home that day. The president met with great warmth and enthusiasm on his goodwill mission, especially from the multitudes who greeted him in Ankara, Karachi, and New Delhi. His five-day stay in India, set against the background of Communist Chinese pressure against the northern frontier, was considered particularly significant. Addressing the Indian Parliament on December 10, he declared that the United States was ready to defend its friends and allies against aggression. On December 11, at the opening of the World Agriculture Fair in New Delhi, he called for a "worldwide war against hunger," and emphasized the theme of the United States pavilion: "Food—Family—Friendship—Freedom."

President Eisenhower's four trips outside the United States in 1959 included talks with President López Mateos in Mexico, February 19–20, and the dedication, with Queen Elizabeth II, of the St. Lawrence Seaway (q.v.) at St. Lambert, Quebec, June 26. In addition, at the White House or at Camp David, he met with many world leaders, including Soviet first deputy premiers Anastas I. Mikoyan, in January, and Frol R. Kozlov, in July; President Arturo Frondizi of Argentina, in January; Prime Minister Macmillan and Premier Hans C. Hansen of Denmark, in March; Sir Winston Churchill, King Baudouin I of Belgium, Chancellor Adenauer, and Prime Minister Robert G. Menzies of Australia, in May; Premier Antonio Segni of Italy, in September; and President Sékou

[2] He became the first president to visit, while in office, Greece, Turkey, Pakistan, India, Afghanistan, Spain, and Tunisia.

(*Right*) President Eisenhower (l.), accompanied by Chancellor Adenauer, is cheered by spectators as he arrives in Bonn, Germany, August 26, at start of his visit to West European capitals.

S. J. F.

ELECTIONS, U.S. Scattered elections in 1959, politically an off year, gave no conclusive evidence of long-range voter preferences on a national scale. Although a majority of voters were at least nominally Democratic, many observers saw an independent, ticket-splitting trend affected by local issues and popular estimates of candidates.

State Elections.—On June 27, voters in Hawaii, including citizens of 20 years of age and over, endorsed statehood by a margin of 17 to 1. In the first state election, on July 28, Hawaii elected as governor Republican William F. Quinn, the incumbent presidential appointee. Hiram L. Fong, Republican, and Oren E. Long, Democrat, were elected to the U.S. Senate, and Democrat Daniel K. Inouye, to the House. In three special elections to fill vacancies, voters in the 4th Missouri Congressional District, on March 3, in the 43d New York District, on May 26, and in the 4th Iowa District, on December 15, chose respectively a Democrat and two Republicans, resulting in a gain of one Republican seat.

In Kentucky, on November 3, Bert T. Combs, Democrat, who had defeated the candidate of retiring Gov. A. B. (Happy) Chandler in a hard-fought primary on May 26, was elected governor over former Republican Congressman John M. Robsion, Jr. On the same day Ross R. Barnett, Democrat, was elected governor of Mississippi. In New Jersey the prestige of Democratic Gov. Robert B. Meyner as a national figure was dimmed to some extent by failure to win control of the state Senate, despite a gain of two seats, and also by a reduced majority in the lower house and by defeat of his referendum to relieve commuter railroads through turnpike profits. Mayor Robert F. Wagner, Democrat of New York City, suffered a political setback by the defeat of a state constitutional amendment to permit the city to issue $500 million in bonds for school construction.

Oklahoma voters, on April 7, removed from the state constitution a prohibition of sale of alcoholic beverages by a margin of more than 80,000. On April 23 the California legislature abolished cross-filing, a device by which candidates in primary elections had often sought nomination from both major parties.

Municipal Elections.—Democrats won all but one of the mayoralty elections on November 3 in the 25 largest cities of Indiana, most of them already under Democratic leadership; Republicans carried only 36 of 107 cities. Republicans made modest gains in mayoralties of upstate New York cities. Democratic Mayor Richardson Dilworth of Philadelphia defeated, almost 2–1, Republican Harold E. Stassen, but in Columbus, Ohio, the Republican candidate unseated Democratic Mayor M. E. Sensenbrenner. Former Utah Republican Gov. J. Bracken Lee, an independent conservative, was elected mayor of Salt Lake City. In Boston's nonpartisan election for mayor, Democrat John F. Collins defeated Senate president John E. Powers, candidate of the party organization.

Earlier in the year, Chicago voters re-elected Democratic Mayor Richard J. Daley by a large margin on April 7. Mayor Thomas D'Alesandro of Baltimore, Md., was defeated in the Democratic primary (March 3) by J. Harold Grady, who easily defeated former Republican Gov. Theodore R. McKeldin in the city election on May 5. On May 25 three segregationist members of the Little Rock (Ark.) School Board were voted out of office in a special recall election after they had attempted to dismiss 44 teachers.

Mayors elected in leading cities in 1959 (on November 3, unless otherwise shown) included the following (D, Democrat; I, independent; NP, nonpartisan; R, Republican):

Baltimore, Md.—J. Harold Grady (D), May 5
Boston, Mass.—John F. Collins (NP, D)
Bridgeport, Conn.—Samuel J. Tedesco (D), re-elected over former Socialist Mayor Jasper McLevy
Camden, N.J.—Alfred R. Pierce (R), May 19
Canton, Ohio—Charles L. Babcock (D), re-elected
Chicago, Ill.—Richard J. Daley (D), re-elected April 7
Cleveland, Ohio—Anthony J. Celebrezze (D), re-elected for 4th term
Columbus, Ohio—Ralston Westlake (R)
Denver, Colo.—Richard Y. Batterton (NP, R), June 16
Evansville, Ind.—Frank F. McDonald (D)
Fort Wayne, Ind.—Paul Burns (D)
Gary, Ind.—George Chacharis (D)
Hartford, Conn.—James H. Kinsella (NP), re-elected
Indianapolis, Ind.—Charles Boswell (D)
Ithaca, N.Y.—Ralph C. Smith (R)
Kansas City, Mo.—H. Roe Bartle (D), re-elected March 31
Minneapolis, Minn.—P. Kenneth Peterson (NP, R), re-elected June 9
Nashville, Tenn.—Ben West (D), re-elected May 14
New Haven, Conn.—Richard C. Lee (D), re-elected for 4th term
Philadelphia, Pa.—Richardson Dilworth (D), re-elected
Pittsburgh, Pa.—Joseph Barr (D)
Salt Lake City, Utah—J. Bracken Lee (I)
San Diego, Calif.—Charles C. Dail (NP), re-elected April 21
San Francisco, Calif.—George Christopher (NP, R), re-elected
Schenectady, N.Y.—Malcolm E. Ellis (R)
South Bend, Ind.—Edward Voorde (D), re-elected
Terre Haute, Ind.—Ralph Tucker (D)
Trenton, N.J.—Arthur J. Holland (D), May 12
Utica, N.Y.—Frank M. Dulan (R)
Waterbury, Conn.—Edward D. Bergin (D)
Yonkers, N.Y.—Kristen Kristensen (R), re-elected
Youngstown, Ohio—Frank N. Franko (D)

(See also DEMOCRATIC PARTY; REPUBLICAN PARTY.)

FRANKLIN L. BURDETTE,
Professor and Director, Bureau of Governmental Research, University of Maryland.

ELECTRICAL DEVELOPMENTS. Research.—An image-converter tube, the Ultrascope, announced in 1959, is the "eye" of a simple attachment for a microscope which allows direct visual inspection of objects illuminated by invisible ultraviolet light. The ultraviolet image of the specimen is projected by the microscope's objective lens onto a photosensitive coating on the inner surface of the tube's faceplate. As the ultraviolet rays impinge on the photosensitive material, they stimulate it to emit beams of electrons in a pattern corresponding to the ultraviolet image, and the beams of electrons are in turn focused on a fluorescent viewing screen at the opposite end of the tube, where a visible image is formed.

Ultrasonic waves having a frequency of 10,000 megacycles per second have been produced by applying microwave electromagnetic radiation to a quartz crystal cooled to approximately −456°F., not quite 4 degrees above absolute zero. It is planned to use the extremely high frequency sound waves thus produced for investigating energy levels of atoms and interactions of electron spins in a crystal lattice.

The first successful direct conversion of nuclear reactor heat into electricity was announced at Los Alamos Scientific Laboratory in April 1959. The conversion was accomplished by a device known as a plasma thermocouple which is inserted into the core of a reactor, where it is activated by the flux of neutrons produced by the reactor. Although the experimental model demonstrated at Los Alamos produced only enough current to light an ordinary household electric bulb, it holds great promise for the commercial generation of electricity without the cumbersome and expensive turbines and electromechanical machinery of con-

ventional atomic power plants. (See also ATOMIC ENERGY.)

Construction of a 12.5 billion-electron-volt accelerator to probe the structure of matter was started at the Argonne National Laboratory in Lemont, Ill. Known as the Zero Gradient Synchrotron (ZGS), it will be housed in a building 200 feet in diameter. The ZGS will use protons as "bullets," accelerating them to an energy of 12.5 bev before shooting them into target atoms.

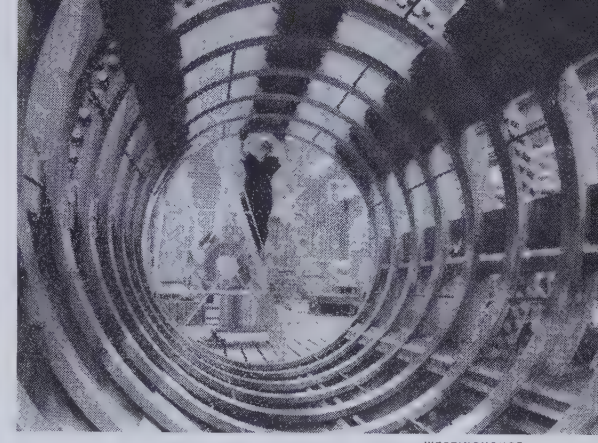
Power Generation.—The first of four nuclear reactors under construction at Chapel Cross, Scotland, began producing power in May 1959. By the end of the year, when all four units were to be in operation, they were to have a power capacity of 140,000 kilowatts, but production of power from the Chapel Cross reactors is secondary to the production of plutonium. The new plant is similar to the station at Calder Hall, England, which has been operating since October 1956.

Significant advances were made during 1959 in the development of fuel cells for converting the energy of chemical fuels directly into usable electrical energy. Similar in principle to the familiar dry-cell battery, fuel cells presently under development consume gaseous fuels, have high operating efficiencies, and are relatively light in proportion to their electrical output. The hydrox cell developed in England by Francis T. Bacon uses pure hydrogen and oxygen as fuels, and has an efficiency of 50 to 60%. In a public demonstration in August, a battery of 40 hydrox cells with an output of 5 kilowatts (6.7 hp.) powered a fork-lift truck. In October, at the Allis-Chalmers Research Laboratory in Milwaukee, a battery of 1,008 cells consuming a mixture of gases (largely propane, and including oxygen) provided the power for a field demonstration of an electrical farm tractor. The Allis-Chalmers battery produced 15 kilowatts (20 hp.) with an efficiency of 60%. Ultimate efficiencies on the order of 80% are theoretically attainable in both the hydrox and the Allis-Chalmers fuel cells.

Two companies in the United States reported progress in 1959 in developing magnetohydrodynamic (MHD) generators. The MHD generator, like the conventional electromechanical generator, operates on the principle of induction, which states that an electrical current will be generated when a conductor is moved across a magnetic field. Like the conventional generator, the MHD generator has a field coil, but the armature of conventional equipment is replaced by a stream of intensely hot, ionized gas (plasma). As the jet of electrically conductive plasma is blasted through the nozzle, it cuts the magnetic field set up by the field coil. The current generated in the plasma by this action is tapped by two electrodes in the nozzle, the equivalent of the brushes in a generator. High operating efficiencies are obtainable from the MHD generator, but the extremely high temperature of the plasma (on the order of 5,000°F.) quickly destroys most structural materials.

The General Electric Co. has designed a gas turbine-powered package power plant for installation as a complete generating unit. The turbine, rated at 20,500 kilowatts, will drive a 25,600-kilovolt-ampere air-cooled generator. Designed for intermittent operation, the relatively inexpensive new unit will enable electric utility companies to handle peak power loads without installing the costly, heavy-duty equipment needed for continuous operation.

Industrial Equipment and Applications.—A new mobile robot with television eyes can "see" and handle dangerous radioactive materials. Operated electrically by a cable or radio link from a position outside the dangerous area, the versatile machine (called the Mobot) can perform a variety of lifting, inverting, and placing operations. While observing the radioactive area through Mobot's four closed-circuit television cameras, the unit's operator can move it about on its wheels to perform various manual tasks with hand tools in the robot's "fingers."



WESTINGHOUSE

A view of the mammoth 3,600-rpm. turbine-generator under construction in 1959 for an Arkansas power station. The completed generator will weigh about 500 tons and will be 42 feet long. It is rated at 384,000 kilovolt-amperes.

Approximately 2 million pounds of aluminum were used in the construction of a new 375,000-kw. power plant near Evansville, Ind. Almost 40% of the aluminum in the station is used in its boilers, turbines, condensers, feedwater heaters, and their auxiliary and structural components. Other important applications include conduits, switchyard structures, and switchgear.

A teletypewriter announced by the U.S. Army prints electrostatically 4 full lines of text per second—50 times faster than a news-service teletypewriter. Its theoretical top speed is 500,000 words per minute. A bank of electron guns "shoots" letters electronically onto a special paper with a high-resistivity coating, forming small letter-shape charged areas on the paper's surface. The electrostatic image thus formed is made visible by powdered ink which is attracted to the charged areas and fixed permanently by application of heat.

An automatic electric frame-wrapper machine for packing books has been put in operation at the Macmillan Company's storage house in New Jersey. The machine, which can handle up to 600

British inventor Francis T. Bacon stands beside his revolutionary fuel cell which converts chemical energy directly into electricity. Using oxygen and hydrogen as fuels, it is relatively light and has a high operating efficiency.

WIDE WORLD

books per hour, automatically forms, packs, and seals book cartons.

Transportation.—"Hurricane Road," an accelerated-test facility developed by the General Electric Co., is now employed by the Ford Motor Co. to test cars in a wide range of simulated weather conditions. Temperatures can be varied from 0 to 160°F., winds from 0 to 125 mph., and driving rains can be produced in the new testing unit. The facility's instruments provide continuous readings of engine power output, oil temperatures and pressures in the transmission and differential, and other factors affecting performance.

The Curtiss-Wright Corp. has developed a flight simulator, called the Visualator, for training pilots in take-off and landing maneuvers. The simulator incorporates a closed-circuit television system whose panoramic-screen receiver is viewed through the cockpit's windshield. As the trainee manipulates the flight controls in a simulated landing or take-off, the terrain, runways, and buildings are depicted on the screen as they would appear in actual flight.

The General Motors Firebird III, shown at the 1959 Motorama in New York City, is the first automobile controlled entirely by electronic means. A single finger-tip control governs steering, throttling, and braking through analogue computers and electrohydraulic servomechanisms. It has electrically controlled heating and air conditioning, ultrasonically operated doors, an electronic horn, and a two-way radio.

Communications.—A new Bell System dial telephone, named the "Call Director," provides interoffice communication, conference hookups, or adds extensions to incoming calls—all at the touch of a button. Other new features for handsets include illuminated dials, hands-free conversational arrangements, automatic answering and recording devices, and push-button dialing.

Radar contact with the planet Venus was established in February 1959 by the Lincoln Laboratory of the Massachusetts Institute of Technology. This was the longest-range radar contact ever made, the round-trip distance being about 56 million miles. A special type of solid-state maser used in the amplifier of the radar receiver increased the range of the equipment as much as would a fourfold increase in transmitter power. (See also PHYSICS.)

The complex distribution problems of many large companies may be simplified by Western Electric Company's newly developed Dataphone system, which automatically transmits orders over telephone lines from widely scattered local offices to a company's central warehouse, where the system records the order, routes the merchandise, makes out the bills, and writes checks. (See also RADIO AND TELEVISION; TELEGRAPH; TELEPHONE.)

Synthetic quartz has been produced by the Western Electric Co. for the Bell System's filters, oscillators, and frequency standards. Crystals up to 3 inches in cross section and 6 inches in length have been grown by a hydrothermal process.

Illumination.—An electronic flash unit capable of delivering 90 million lumens in $\frac{1}{1000}$ second has been developed for reconnaissance aircraft. The unit consists of a xenon-charged quartz flash tube (about $1\frac{1}{3}$ inches long, with the diameter of a pencil), an aluminum reflector, and an 850-volt power pack. Intervals between flashes may be as short as one-half second.

A lamp about the size of a dime, which produces an intensely bright light for a short period, has been designed for use with an infrared device for tracking the early flight of missiles. It burns brilliantly for about 15 seconds, until its glass envelope melts and collapses. In another development, an extremely reliable lamp for illuminating airplane instruments has been developed. It is capable of burning continuously for a period estimated at several million years.

A trace of iodine gas in the mixture filling a new tungsten-filament lamp catches the tiny particles of tungsten that evaporate from the incandescent filament and returns them to the filament. This process prevents the particles from blackening the inner surface of the lamp's glass envelope.

Electromedical.—The world's first nuclear reactor designed for medical use, with a nominal operating power of 1,000 kw., was dedicated early in 1959 at Brookhaven National Laboratory in Upton, N.Y. Two ports in the concrete shielding walls permit beams of neutrons to pass from the reactor into the treatment rooms, one for humans and one for animals. The beams can be shut off in 3 seconds by thick 21-ton shutters. The medical research center includes a 48-bed hospital.

A 20-pound package of medical instruments to measure and record the physiological condition of man in space has been developed by Gulton Industries. Six physiological parameters can be measured to reveal blood pressure, heart sounds and rate, respiration rate and depth, skin temperature, and galvanic skin resistance.

Electronics.—A new radar set has been developed to pinpoint the location of enemy mortar shells in flight and then compute electronically the point from which the shell was fired. Its range is accurate up to about 6 miles.

A completely automatic electronic reservations system has been developed by International Business Machines for American Airlines. The new equipment will handle all clerical procedures in the sale, confirmation, and control of air travel tickets. The computer for the New York City area will be connected by telephone lines to more than 1,100 ticket agents, who will be able to obtain reservation data on any flight within three seconds.

A complex electronic circuit, consisting of two transistors, two capacitors, and eight resistors, has been miniaturized to the size of the head of a paper match. It is believed that about 500,000 of these tiny circuits (called micromodules) could be interconnected within a one-cubic-foot space.

An outstanding astronomical and electronic event of 1959 was the series of Stratoscope I balloon flights, sponsored by the National Science Foundation and the Office of Naval Research. A 12-inch solar telescope was sent up to 80,000 feet by means of an unmanned balloon about one million cubic feet in capacity. The telescope was linked optically to a motion picture camera to obtain a continuous record of the sun's image as seen by the telescope. A closed-circuit television link, together with remote control equipment, enabled the operators on the ground to focus the telescope on any point on the sun's surface. (See also ASTRONOMY; ELECTRONICS.)

ELECTRIC LIGHT AND POWER INDUSTRY

Power Plant Generating Capacity.—As of Dec. 31, 1958, the total generating capacity of the United States was 160.2 million kw., of which 108.8 million kw. was in privately owned utilities, 33.5 in publicly owned utilities, and 17.8 in industrial, mine, railway, and other plants. Gross additions of 13.25 million kw. in electric utility capacity in 1958 were the largest in the industry's history. Additions scheduled for the next four years total 42 million kw. in capacity, of which about three fourths are to be constructed by private companies, and the rest by government agencies. At the end of 1959, the United States had two opera-

ble full-scale civilian nuclear power reactors: the 60,000-kw. plant at Shippingport, Pa., and the 180,000-kw. Dresden Nuclear Power Station (to be in regular operation in 1960) at Morris, Ill. In addition, 14 other civilian power reactor projects with ratings of 10,000 kw. or more were under way.

U.S. ELECTRIC ENERGY SALES AND REVENUES, 1958

Classification	Customers (number)	Revenue (millions of dollars)	Distribution (millions of kw.-hr.)
Commercial, industrial	6,596,486	5,043	376,236

U.S. Power and Light Production.—In 1958, 724 billion kw.-hr. were generated in the United States, including 79.3 billion kw.-hr. produced by sources other than electric utilities. This total is about 1% greater than that of 1957, despite reduced industrial activity during a great part of 1958. Of the total 1958 production, 77.6% was generated by steam plants and 21.7% by hydroelectric installations. (See also FEDERAL POWER COMMISSION; PUBLIC UTILITIES; RURAL ELECTRIFICATION ADMINISTRATION.)

World Electric Energy Production.—Production of electric energy in 1958 by major countries (excluding the United States) is shown in the accompanying table.

ELECTRIC ENERGY PRODUCTION, BY MAJOR COUNTRIES, 1958

Country	Millions of kw.-hr.	Country	Millions of kw.-hr.
Austria	13,559	Italy	45,155
Belgium	12,518	Luxembourg	1,229
Bulgaria	2,797	Netherlands	13,116
Czechoslovakia	16,451[1]	Norway	25,570
Denmark	3,824	Poland	21,912
Finland	7,890	Rumania	5,421[1]
France	61,892	Spain	14,587[1]
Germany, East	30,421[1]	Sweden	30,415
Germany, West	89,551[2]	Switzerland	16,878
Greece	1,802	Turkey	2,300
Hungary	5,870	United Kingdom	107,016
Iceland	469	USSR	233,018
Ireland	1,570[1]	Yugoslavia	7,119

Associate Editor, "Electrical Engineering."

ELECTRIFICATION, Rural. See RURAL ELECTRIFICATION ADMINISTRATION.

ELECTRONICS. Electron Tubes.—One of the necessary evils of the vacuum tube has always been the amount of electrical power required simply to heat the cathode that emits the electrons. This power is otherwise wasted, since it contributes nothing to the electronic function of the tube or to the output of the tube circuit. In addition, the heat that the tube's metal or glass envelope has to dissipate can be a problem in the proper operation of the complete equipment or its environment.

A major breakthrough in electron tube design was made in 1959 with the development of a "cold" cathode electron tube that does not contain the usual filament. The cathode consists of a sprayed-on coating of porous magnesium oxide, used in the manufacture of milk of magnesia. It has been found that electron emission in the magnesium oxide cathode can be started by light, by a small quantity of a radioactive substance, or by a tiny filament that requires electrical power for only a fraction of a second. Once emission is initiated, the tube operates much like those in a conventional home receiver. Tubes resembling the conventional ones have been made and demonstrated in a phonograph amplifier by Tung-Sol Electric, Inc., developers of the tube in conjunction with the Army Signal Corps. While the tube is operating, the cathode glows with a blue light; although some heat is produced, it is only a very small percentage of the heat of a thermionic electron tube.

Another novel electron tube, called the Nuvistor, has been developed by the Radio Corporation of America. This tube is particularly useful at higher frequencies and is more rugged and efficient than ordinary tubes. It benefits from a new design approach to mechanical and electrical factors, known as the "new vista." The tube is about the size of a thimble, and its component elements are assembled very precisely by using new techniques. As a result, it continues to function normally when it is heated to 660°F. or when placed in liquid nitrogen at −320°F. Torture and endurance tests have included one of dropping the glass tube from a height of several feet to a metal block, demonstrating its ruggedness.

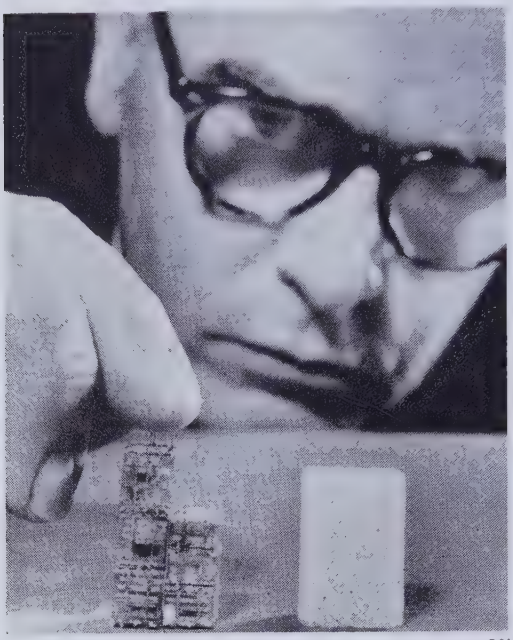
Blood Pressure Monitor.—Instead of the normal method of measuring blood pressure by using an arm cuff and a stethoscope to listen to sounds in the artery below the cuff, a new instrument invented by an English doctor requires only that a small digital cuff containing a crystal microphone be fitted over the patient's finger. The main disadvantage of the arm cuff is that it causes discomfort to the patient if left on for any length of time; also the stethoscope can be used only in quiet surroundings and provides only spot readings. Another method, in which a hollow tube is inserted into an artery, also causes discomfort and carries with it the danger of clot formation in the artery.

The new method is painless and can be used while the patient is asleep. The necessary information is relayed automatically to a remote point, such as a nurses' room. Any abnormal change in pressure immediately alerts the alarm system of the equipment. An electromagnetic valve opens and closes with the pulsations. A fixed leak deflates the cuff when arterial pulsations stop, since the pressure in the cuff exceeds systolic arterial pressure; the electromagnetic valve then opens automatically, more air is pumped into the cuff, and the cycle is repeated for any required period. The cuff pressure in this way follows changes in systolic blood pressure, and all such changes are revealed on instruments.

It is now possible to preset the apparatus to achieve a desired blood pressure level for as long as required. A solenoid device automatically controls the intake of drugs by injection, so that blood pressure constantly remains at the required level. Any variation from the predetermined maximum and minimum sets off an alarm, at the same time cutting off the supply of the drug.

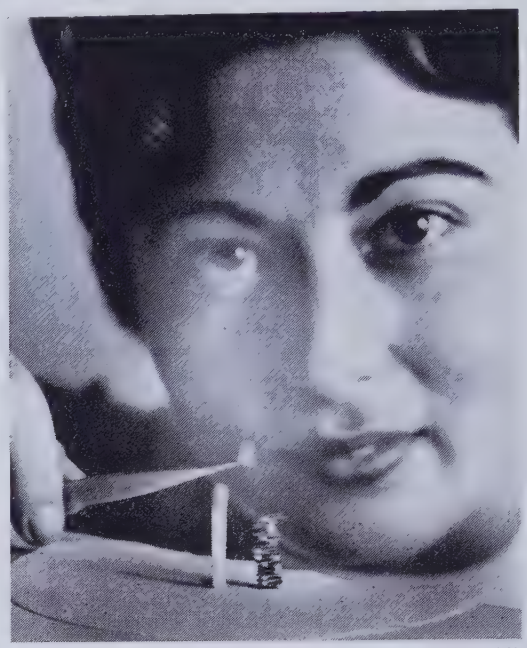
Aircraft Landing System.—Newly developed by Bell Aircraft Corporation, an automatic, electronic, all-weather landing system may end aircraft stackups which cause traffic congestions at all airports. In addition, the system will allow flights which are normally canceled because of weather conditions, and promises revolutionary improvement for landing aircraft under Instrument Flight Rule (IFR) conditions. Holding time is cut to a minimum because the system enables the landing of 120 aircraft an hour.

Basically, the system employs a radar tracking beam which automatically tracks the approaching



RCA

The "works" of a military radio developed by the Signal Corps and RCA is compared with a lump of sugar. It is part of a miniaturization program which uses tiny micromodules, circuit "building blocks" measuring one third of an inch, which do the work of transistors and other components.



RCA

A new electronic device, known as a tunnel diode, is held in tweezers next to the head of a match (beside a stack of 15 units). Designed for space age equipment, the tunnel diode has such extremely small power requirements that hundreds can be operated from a single 1½-volt flashlight cell.

aircraft and supplies accurate position information to an electronic computer. The actual flight path of the aircraft being landed is measured and compared with the desired flight path, and any difference between the two results in correction signals which are sent by radio to the plane's autopilot. The autopilot controls any type of aircraft for as long as the pilot desires—until visual reference is established or to actual touchdown. The pressing of a switch on the autopilot instantly restores control of the aircraft to the pilot. A control monitor sitting at a console in the trailer follows the entire automatic operation. To aid him, a radarscope is provided, in addition to a plotting board on which is shown the actual glide path as compared with the desired glide path. A recorder is available to record desired information pertaining to aircraft position, position error, speed, and acceleration. The actual commands transmitted to the aircraft also can be recorded, thus providing a permanent record of each landing.

In case of airborne equipment malfunction, these facilities and voice communications supply data equivalent to that provided by present approach systems. Automatic wave-off goes into action whenever there is equipment malfunction or excessively large errors. The information transmitted to the airplane is displayed on conventional cockpit instruments and will permit manual landing by the pilot instead of the autopilot if desired.

Music Synthesizer.—An electronic system constructed to generate any imaginable musical tone has been installed at Columbia University for use in a program of composition and research in electronic music. The project is being conducted jointly by Columbia and Princeton universities, under a grant of the Rockefeller Foundation.

Radio Sextant.—For the first time, the moon has been tracked continuously by radio through the use of a new precision radio sextant designed and constructed by the Collins Radio Company. It has been installed aboard the Navy's experimental navigation ship, the U.S.S. *Compass Island*, to be used in navigation research. The sextant also tracks the sun with high precision. The moon is more difficult to track, however, since its radiation is about 50 times weaker than the sun's. The total lunar power available to the sextant must be multiplied by 500,000 billion to equal that used by a small Christmas tree light. To track accurately, the receiver must distinguish power changes which are a minute fraction of the total power received.

The radio sextant is capable of tracking both the moon and sun under all weather conditions from moonrise to moonset and from sunrise to sunset. It also functions as a precise compass, with more than ten times the accuracy of present marine compasses. In the radio sextant, the antenna scans a circle around the sun or moon's rim; if the antenna is pointed directly at the sun or moon, the received signal will show no modulation at the scanning frequency, but if the antenna is displaced slightly, the signal will be modulated. Phase-sensitive detectors derive error voltages which are used to keep the antenna on course. The sextant contains the most sensitive radio receiver ever built for the measurement of thermal radiation in the short microwave region. This receiver, which operates at a wave length of 1.8 centimeters, allows the determination of the antenna position with the necessary precision.

ELIZABETH II (ELIZABETH ALEXANDRA MARY), queen of Great Britain and Northern Ireland; head of the Commonwealth of Nations; b. London, England, April 21, 1926.[1] Great Britain's first

[1] In 1959 the queen's birthday was officially celebrated on June 13.

reigning queen since Victoria (1819–1901), Elizabeth II ascended the throne on Feb. 6, 1952, and was crowned on June 2, 1953.

Spending her childhood at Buckingham Palace and other royal residences, the then Princess Elizabeth was educated by tutors under the surveillance of her mother, the Duchess of York and later queen, and her grandmother, Queen Mother Mary, who supervised her kindergarten training. At the age of 10, on the accession of her father, George VI, the princess became heiress-presumptive to the throne.

Commencing in 1944, Princess Elizabeth served as a member of the Council of State, which deputized for her father during his absences from the country. In July 1944 she first exercised her responsibility as a councilor of state by signing a series of parliamentary acts.

On Nov. 20, 1947, Princess Elizabeth was married to Lt. Philip Mountbatten, a third cousin and a member of the ruling family of Greece. To the couple were born (Nov. 14, 1948) a son, Prince Charles Philip Arthur George, who became heir-apparent and Duke of Cornwall on the death of King George VI, and (Aug. 15, 1950) a daughter, Princess Anne Elizabeth Alice Louise. On July 26, 1959, the queen announced that her son would become Prince of Wales, with the investiture likely to take place when the boy reached 16 or 17. A third child was expected in February 1960.

Prince Philip, who was born on Corfu Island, Greece, on June 10, 1921, was sixth in line for the throne of Greece until he became a British subject on March 18, 1947. He attended the royal naval academy at Dartmouth, entered World War II service as a midshipman in 1939, and served as a lieutenant throughout most of the war. He was created Duke of Edinburgh on Nov. 20, 1947. On Feb. 21, 1957, he was given the title of Prince of the United Kingdom by Queen Elizabeth. His official title was designated as His Royal Highness the Prince Philip, Duke of Edinburgh.

Following her convening of the Atlantic Congress (an unofficial meeting of citizens of NATO countries) on June 5 in London, Queen Elizabeth and Prince Philip arrived by air in St. John's, Newfoundland, on June 18 for a six-week tour of Canada. The primary purpose of her trip was to participate with President Dwight D. Eisenhower in the official opening of the St. Lawrence Seaway (q.v.) on June 26 at St. Lambert, Quebec. Following the ceremony, the president and his party were guests of the queen aboard the royal yacht *Britannia* as it sailed through the St. Lambert Lock and cruised the seaway for five hours. With Vice President Richard M. Nixon, the queen on June 27 dedicated the St. Lawrence hydroelectric power project at Massena, N.Y. On July 6, aboard the *Britannia*, she sailed to Chicago (q.v.) for her first visit to that city.

During part of the remainder of the queen's tour, which carried her as far north as the Yukon Territory and as far west as British Columbia, she appeared tired and ill. The reason for her indisposition was not known until after her return to England on August 2. On August 7 it was officially announced that she was expecting her third child.

The announcement of the queen's pregnancy was accompanied by the news that she would be unable to undertake a planned tour of West Africa in the fall. Consequently, Prime Minister Kwame Nkrumah of Ghana, one of the commonwealth nations, visited the queen at Balmoral Castle in mid-August. Later, on August 28, President Eisenhower was also a guest at Balmoral.

One of the queen's last official acts during 1959 was the dissolving of Parliament on September 18 in preparation for the general elections of October 8. On October 14, Prime Minister Harold Macmillan (q.v.) announced that the queen had approved his new Conservative cabinet.

ELLICE ISLANDS. See WESTERN PACIFIC ISLANDS, BRITISH.

EL SALVADOR. The smallest and most densely populated of the Central American republics, El Salvador is bordered by Guatemala on the north, Honduras on the east, and the Pacific Ocean on the south and west. Area, 8,259 square miles; population (July 1959 est.), 2.5 million, of which over 60% is rural. The largest cities are San Salvador, the capital, 212,542 (1957 est.); Santa Ana, 109,711 (1953 est.); and San Miguel, 63,429 (1953 est.). Over 90% of the population is of mixed Indian-European descent. Spanish is the official language.

Government.—The constitution of 1950 vests executive power in a president (Lt. Col. José María Lemus, inaugurated Sept. 14, 1956) who is elected by popular vote for a 6-year term, and is not eligible for an immediate second term. Legislative power rests with a Legislative Assembly of 54 deputies elected by direct vote for 2-year terms. The governors of the 14 departments into which the country is divided are presidential appointees.

Religion and Education.—Roman Catholicism is the predominant faith. The constitution guarantees freedom of worship. Primary education is free and compulsory, but facilities are not sufficient for all school-age children. According to the 1950 census, some 57% of the population 10 years of age and older is illiterate. Recent governments have tried to improve the school system. School enrollment in 1957 was 242,263, only 35% of which was in the rural areas where the bulk of the population lives. The National University in the capital had 1,525 students in 1956.

Finance.—The unit of currency is the colón, equal to U.S.$0.40. The government's fiscal position is highly dependent on export-import revenues, with customs receipts the largest item of government revenue and the export tax on coffee the second largest. The government has for some years adhered to conservative fiscal practices, avoiding deficit financing, and even accumulating a surplus in the treasury. Coffee export difficulties in 1958–59, however, led to depletion of the surplus. The budget for 1959 was set initially at $72.4 million, the same as that originally announced for 1958 (later increased to $76.4 million). This was the first time in years that the budget total was not set higher than that of the previous year. The total direct foreign debt was $16.7 million as of July 31, 1958. Gold and foreign exchange holdings of the Central Reserve Bank and private banks totaled $56.7 million in June 1959, compared with $52.24 million in June 1958.

Transportation and Communications.—Two railway companies, both foreign-owned, operate a total of 469 miles of track in El Salvador, and connect with Guatemalan lines. The highway system consists of 2,068 miles of national roads, over half of which are paved. The 197-mile section of the Inter-American Highway crossing El Salvador is entirely paved. Construction of the 190-mile Littoral Highway continued in 1959. In January 1959 the World Bank and United States private banks lent El Salvador $5 million for additional work on the Littoral Highway and construction of 21 feeder roads. As of Jan. 1, 1957, 18,009 motor vehicles were registered. There are three seaports and one international airport.

Production.—The gross national product increased at an annual average of 6.8% in 1945–57, more than enough to keep ahead of the large annual population increase of about 3.3%, but it remained relatively stable in 1958. Nearly all the tillable land is in use, and the country has few other natural resources. In recent years El Salvador has been virtually self-sufficient in the chief food crops—corn, beans, rice, sorghum, and sugar—but it may be difficult to avoid a rise in imports. An increase in nonagricultural activity is indicated by the fact that in 1945–57 the agricultural share of the gross national product decreased from 48.2% to 36.2%, and the share of industry rose from 10.1% to 14.2%; construction, from 3.2% to 8.9%; and commerce, from 19.36% to 21.0%. The manufacturing production index (1956 = 100) was 121.3 in February 1958 and 126.10 in February 1959.

Nearly all the coffee produced is exported. Coffee exports for the 1957–58 crop year totaled 1,112,035 bags (of 69 kilograms, or about 152 pounds, each), second only to the record 1,235,000 bags exported in 1956–57. By the end of June 1959, 1,171,436 bags of the 1958–59 crop had been exported. The 1958–59 cotton crop was about 175,000 bales, the largest in history, compared with 158,000 in 1957–58. Most of the cotton crop is exported; local mills use about 15,000 bales annually. Corn production in the 1958–59 crop year

was 3,017,502 quintals (of 101.4 pounds each), compared with 3,228,958 in 1957–58. Sugar production in 1957–58 was 921,755 quintals, slightly less than that of the previous year.

Foreign Trade.—After a long rise in the value of both exports and imports in the years 1943–57, in 1958 the value of exports (289.9 million colónes) was down about 16% from 1957, and that of imports (269.0 million) was down about 6%. This development both reduced foreign exchange and the traditional favorable balance of trade. Prices for the 1958–59 coffee crop were about 12% less than those of the previous year, and this drop accounted for most of the decline in foreign trade value. Of the 1,171,436 bags of coffee exported in October 1958–June 1959, the United States took 48% and West Germany 40%, continuing the export pattern of recent years. Foreign exchange earnings from cotton increased from $1.56 million for the 1947–48 crop to $19.8 million for 1957–58. Although the 1958–59 crop was the largest in history, lower prices kept the export value about to that of the previous year. El Salvador's imports from the United States, which doubled in value during 1948–57, declined 10% in 1958, to about $45 million, apparently because of the high price of United States goods.

Principal Events, 1959.—The economy bore up well under the decline of export prices, largely because large coffee and cotton crops compensated for lower prices. Although the sense of an economic crisis thus was less acute than in 1957–58, both business and government circles nevertheless continued to be much concerned about world overproduction of coffee.

The year saw continued evidence of Salvadoran and Central American nationalism. In February, President Lemus asked Salvadorans to buy Central American goods. A new Salvadoran tariff law was adopted to promote purchase of Central American wares. Numerous meetings with representatives of other Central American states advanced the cause of regional economic integration. In April, El Salvador allowed its commercial treaty with Great Britain to lapse, partly as an effort to induce larger British purchases from El Salvador.

The political scene was stirred early in the year when Arturo Romero, a well-known political leader of antimilitary views, living in Costa Rica, was elected president of the National University of El Salvador by its faculty, students, and graduates. However, Romero declined the appointment. There were political overtones also to the annual student parade in May which was denounced by President Lemus as offensive to public morality and was condemned by the local Roman Catholic hierarchy. By July, preparations clearly were under way for the May 1960 elections of deputies to the National Legislative Assembly, now monopolized by the official Revolutionary Party of Democratic Unification. Two opposition parties were being formed, both apparently ready to make an issue of alleged military domination of national politics.

During his official visit to the United States on March 9–21, President Lemus discussed with President Eisenhower the economic problems facing Central American countries, particularly the difficulties created by the recent decline in world coffee prices.

ENDOCRINOLOGY. Thyroid-Adrenal Interrelationships and the Serum Cholesterol.—Research workers at the Sloan-Kettering Institute for Cancer Research, New York City, have made a fundamental observation regarding the endocrine control of the serum cholesterol which may well represent a major breakthrough in the fight against atherosclerosis, the No. 1 killer of humans. When this observation was made, Drs. L. D. Hellman, H. L. Bradlow, B. Zumoff, D. K. Fukushima and T. F. Gallagher were studying the interrelationships of tri-iodothyronine, a metabolite of the thyroid hormone, and androsterone, a metabolite of adrenal androgens, in myxedema, a disorder of the thyroid with which hypercholesterolemia (excess of cholesterol in the blood) is often associated.

In order to more fully understand the significance of their rather complex observations, some background information will be helpful. Since the turn of the century, it has been well known that cholesterol is involved in the pathogenesis of atherosclerosis. In fact, cholesterol, when deposited in the walls of the arteries, is one of the substances that make the vessels "hard." Since cholesterol is found in many foods, such as fats and eggs, it has been common practice to try to lower the blood cholesterol through diet and thus prevent strokes and heart attacks. At least one reason why this approach has been notably unsuccessful is that the human body is capable of synthesizing cholesterol from almost any foodstuff.

Myxedema (severe hypothyroidism) usually causes marked elevation of the serum cholesterol, and often premature atherosclerosis. Treatment of the myxedema will bring the cholesterol back to a normal level. In fact, it is only in myxedema that elevated serum cholesterols can be dramatically and consistently lowered. Thyroid hormone has often been employed also in euthyroid patients with hypercholesterolemia, but without success.

Hypothyroidism results in a diminution of almost all of the body's metabolic functions, including a decrease in adrenal cortical secretions. The latter can be demonstrated by a reduction of the excretion of urinary 17-ketosteroids. This reduction is mainly at the expense of androsterone, an alpha 17-ketosteroid which is an excretion metabolite of adrenal and testicular androgens (male hormone-like substances). When myxedematous patients were given tri-iodothyronine, the serum cholesterols fell to normal and the excretion of androsterone increased, as might be expected. The startling observation made by the Sloan-Kettering investigators was that when androsterone was given to the myxedematous patients, their cholesterol levels also fell to normal. In other words, an adrenal steroid metabolite was found to have an action heretofore attributed to the thyroid hormone. Next, androsterone was given to euthyroid subjects with normal and elevated serum cholesterols, and the levels were also found to be lowered in these individuals.

Androsterone may be the prototype of a new class of substances with potential advantage in the treatment of hypercholesterolemia. Since androsterone production normally declines with age, and in view of the influence of this metabolite on the cholesterol level, it seems reasonable to suggest that these events may be causally related. Androsterone is not the sole factor concerned with the serum cholesterol, and the serum cholesterol probably is not the sole factor in the etiology of atherosclerosis. Nevertheless, a deficiency of androsterone may be one of the mechanisms involved in the pathogenesis of atherosclerosis.[1]

[1] *Journal of Clinical Endocrinology and Metabolism,* 19:936, August 1959.

Transcortin.—Drs. A. A. Sandberg and W. R. Slaunwhite, Jr., of the Roswell Park Memorial Institute, Buffalo, N.Y., report their investigations of transcortin, a corticosteroid-binding protein of the plasma. Cortisol (hydrocortisone) is bound to transcortin 6,000 times more strongly than it is to albumin. It appears that transcortin-bound cortisol is biologically inactive and not available for metabolism. When the cortisol concentration exceeds the binding capacity of transcortin, physiological effects appear. Transcortin capacity has been shown to be very low in new-born infants, and slightly increased in children and in patients with rheumatoid arthritis. The study of transcortin opens a new approach to the understanding of the physiology of the vital adrenal steroid hormones.

Female Sexuality after Adrenalectomy.—Drs. S. E. Waxenberg, M. G. Drellich, and A. M. Sutherland of the Memorial Hospital, New York City, studied women who had undergone total bilateral oöphorectomy and adrenalectomy for metastatic breast cancer. Neither breast cancer itself nor any previous surgery had as profound an impact on sexual behavior as did adrenalectomy. Ovarian ablation by itself does not radically alter sexual behavior once the reproductive organs have matured. It was concluded that the adrenal glands, more specifically the androgens (male hormone-like substances) of adrenal origin, play a critical part in maintaining the patterns of sexual behavior in the human female.

ENGLAND. See GREAT BRITAIN.

ENGLISH LITERATURE. Much of the year's literary news was made by writers of a former generation, or by books written earlier in this century. On New Year's Day, 1959, E. M. Forster reached his 80th birthday, on which occasion he was widely hailed as England's greatest living novelist despite the fact that it has been 35 years since his last novel, *A Passage to India,* was published. W. Somerset Maugham, who was 85 on January 25, brought out what he insisted was his last book, a collection of essays, *Points of View* (London, 1958; New York, 1959), and embarked on a tour of the Far East. From the pen of the 87-year-old veteran writer, John Cowper Powys, came *Homer and the Aether,* a remarkable study of the *Iliad.* At the age of 81, the poet laureate, John Masefield, read portions of an unpublished narrative, *The Story of Ossian,* for the British Broadcasting Corporation.

Aldous Huxley's *Brave New World Revisited* (New York, 1958; London, 1959) showed that many of the "fantastic" prophecies Huxley had made in *Brave New World* (1932) had come true; furthermore, it predicted a future society quite as grim as that forecast in the earlier work. Devotees of Frederick Rolfe ("Baron Corvo") were gratified by the appearance of *Letters to C. H. C. Pirie-Gordon,* the first of ten sumptuously printed volumes of the correspondence of the eccentric author of *Hadrian the Seventh* (1904). In *Lost in the Dark Wood,* the first volume of a planned series entitled *Journey to the End of Time,* Sacheverell Sitwell, now in his 60's, began an investigation of the cultural significance of death. The book was richer in esoteric learning than in spiritual insight.

Certainly the year's most spectacular news event relative to English literature was the publication in the United States of the unexpurgated edition of D. H. Lawrence's *Lady Chatterley's Lover.* For 30 years, following its original publication in Florence in 1928, this edition was banned from importation into the United States because of its alleged obscenity. In 1959, after an unexpurgated American edition had been brought out, it was also excluded from the mails—an action which a federal court subsequently ruled to be in violation of constitutional guarantees of freedom of speech and press (see CENSORSHIP).

Fiction.—Toward the end of 1958, four novels appeared that were probably as distinguished as any published in 1959. Lawrence Durrell's *Mountolive,* the third volume of a proposed tetralogy, continued to unfold the complex and baffling events already introduced in *Justine* (1957) and *Balthazar* (1958). Unlike its lush and ornamental predecessors, *Mountolive* is written in a straightforward narrative style. Although Angus Wilson's *The Middle Age of Mrs. Eliot* disappointed some of his admirers because it lacks the venomous satirical tone of his earlier writing, it proved to be a subtly and solidly constructed study of a young widow's painful discovery that self-fulfillment cannot be attained by manipulating the lives of others. Iris Murdoch's fourth novel, *The Bell,* brilliantly and tragicomically depicts the disintegration of a lay religious community under the impact of uncontrolled erotic urges. *The Rack,* a remarkable first novel by A. E. Ellis, describes with clinical exactitude life in a tuberculosis sanatorium and a patient's losing fight against the disease.

From the practiced hand of Ivy Compton-Burnett came *A Heritage and Its History,* in which the author's familiar mixture of secret sin, family hostilities, and overpowering greed is made tolerable by her unfailing wit and by her wisdom about the seamier sides of human nature. David Garnett's novelette, *A Net for Venus,* modernizes the ironical legend of the love of Venus and Mars and the ultimate triumph of Venus' crippled husband, Vulcan. Walter Allen's *All in a Lifetime* (American title, *Threescore and Ten*) is a novel in which the narrator reconstructs the eventful decades of his life as a worker, a husband, and a father of three sons, one of whom, his favorite, is a ne'er-do-well. Muriel Spark's *Memento Mori* is a *tour de force* in that there are no major characters under 70. Miss Spark made macabre tragicomedy out of the idiosyncrasies and the enfeebled but persistent urges of senescence.

In *A Guest and His Going,* P. H. Newby drew on his personal knowledge of Middle-Eastern types to tell a hilarious, if farcical, tale of Anglo-Egyptian relations. With sympathetic insight, Pamela Hansford Johnson's *The Unspeakable Skipton* recounts the latter days of an expatriate Englishman resembling Frederick Rolfe, the devious devices by which he attempts to keep himself afloat, and his ultimate defeat by persons too strong for him to manipulate. *The Ruined Boys* (American title, *That Distant Afternoon*) by the poet Roy Fuller knowingly recounts the spiritual liberation of a sensitive boy as he becomes disillusioned with the masters of a second-rate public school headed for dissolution.

In his third novel, *A Travelling Woman,* John Wain renounces the social urgency of his earlier fiction to tell a complex but adroit tale of the unsuccessful attempts of middle-class males to brighten their lives by extramarital dalliance. In *Providence Island: An Archaeological Tale* Jacquetta Hawkes divertingly describes a group of English scientists who discover on an uncharted Pacific island a physically ideal race of survivors from the Paleolithic Age. The two cultures unite to frustrate atomic experiment plans of the U.S. Air Force.

Two second novels, John Bowen's *The Centre of the Green* and John Rosenberg's *A Company of Strangers,* using settings that shift from the English countryside to London, reveal the unwholesome complications that arise when there are destructive

hostilities within families. Alan Sillitoe's *Saturday Night and Sunday Morning,* which won the Authors' Club Prize in 1958, and his second book, *The Loneliness of the Long-distance Runner,* are regarded as authentic working-class novels.

Drama.—Despite the fact that revivals of Shakespeare and such successful American importations as Eugene O'Neill's *The Iceman Cometh* and *Long Day's Journey into Night,* as well as the musicals *My Fair Lady* and *West Side Story,* were among the most vital productions on the English stage, there was abundant evidence of a desire on the part of British playwrights to break away from the restrictions of the "well-made" play and the drawing-room drama so dear to the hearts of fashionable theatergoers. In the traditional vein, *Look After Lulu,* Noel Coward's characteristically brittle adaptation of French playwright Georges Feydeau's 1908 farce, *Occupe-toi d'Amélie,* met with a less than enthusiastic reception from the critics, although it was brilliantly acted by Vivien Leigh, Anthony Quayle, and George Devine. Closest to the upper-class drama popular with London's West End audiences was Hugh and Margaret Wilson's *The Grass is Greener,* a triangle comedy in which the lover is an American oil millionaire, and the husband, an English nobleman. Graham Greene's *The Complaisant Lover* also used the triangle theme; however, in this case the protagonists are definitely not upper class—a departure from the popular formula. Fresher in plot and more distinguished in execution was Michael Redgrave's dramatization of Henry James' *The Aspern Papers* —an adaptation which succeeded in projecting most of the subtle values of James' famous novel.

But there were also bold attempts to vitalize the English drama through the use of unfamiliar subject matter or novel infractions of the conventions of the "well-made" play." An example of this new type of drama is *A Taste of Honey,* a first play by Shelagh Delaney ("Britain's Françoise Sagan"), written when she was 18 years old. *A Taste of Honey* tells of a young girl who, in her struggle to run away from the sordid world in which she has been reared, is cynically betrayed by a Negro sailor. Faced with the prospect of giving birth to a Negro child, she is strengthened in her ordeal by the concern and tenderness of a sensitive, protective art student.

Arnold Wesker's play, *Roots,* first produced in Coventry, dealt unsentimentally but sympathetically with the unsuccessful effort of a young woman to escape from the cultural poverty of life among inarticulate Norfolk farm laborers. Another play by Wesker, *The Kitchen,* using as its setting the behind-the-scenes milieu of a great restaurant, presented a mode of life and work unfamiliar to most theatergoers. Brendan Behan's *The Hostage* did not quite succeed in its telling of the plight of a kidnaped British soldier who is to be hanged if his opposite number, an Irish Republican Army soldier held by the British, is not released.

Frank Norman, writing from a personal knowledge of the world of petty criminals and their lights-o'-love, offered *Fings Ain't Wot They Used T'Be,* which had its moments of truth and vitality but was too scattered in its effect to capture the drive of its American model, *Guys and Dolls.* Perhaps the season's boldest experiment was the musical, *The World of Paul Slickey,* by John Osborne, the most spectacular of England's Angry Young Men. The author-director's satirical whip flailed so wildly at everything he hates that the production failed sensationally.

Poetry.—No volume of poetry published in 1959 approached in popularity that of John Betjeman's *Collected Poems,* which sold more than 30,000 copies within four months of its publication in November 1958. Betjeman, who may be described as contemporary England's most distinguished minor poet, proclaimed with remarkable verbal and metrical dexterity his enthusiasm for quaint holdovers from Victorianism, and his detestation of the neon-lit vulgarities of the current scene.

Betjeman's great popularity, however did not completely overshadow two additional important publications: Ralph Hodgson's *The Skylark, and Other Poems* (1958) and I. A. Richards' *Goodbye Earth, and Other Poems* (New York, 1958; London, 1959). The Hodgson volume offers both early and later poems from the pen of this fastidious writer. Comparison of the early and more recent poems shows that the poet has sloughed off some of his romantic heritage and is increasing in subtlety and depth. I. A. Richards' first volume of poetry is so stylistically complex and intellectually subtle that it demands the sort of intensive critical analysis that formed the basis of Richards' reputation as the most influential critical theorist in English letters in the 20th century.

The contents of Robert Graves' *Collected Poems, 1959* belie its title, since the poet has ruthlessly eliminated poems from earlier collections that no longer measure up to his stern critical judgment. In *Eighty-Five Poems,* Louis MacNeice assembles examples of his own work that effectively illustrate the diverse categories in which his poems belong.

Among volumes by younger poets, Ann Ridler's *A Matter of Life and Death* struck no notes unfamiliar to her admirers, but continued with assured skill to exhibit delight in human love and tenderness. Christopher Logue's *Songs* ranged widely, and sometimes wildly, in mood. *The Cocks of Hades* by C. A. Trypanis (Kōnstantinos A. Trypanēs) gave modern interpretations of Greek myths.

Criticism.—Helen Gardner's *The Business of Criticism* was a lively attack on the excessive professionalism of much contemporary criticism, and a defense of the traditional proposition that "the critic's function is to assist his readers to find the values which he believes the work to have." Miss Gardner might well deem Christine Brooke-Rose's *A Grammar of Metaphor* (1958) to be an example of the professionalism she was attacking, since, in analyzing the relation between grammar and metaphor in the works of poets from Chaucer to Eliot and Pound, Miss Brooke-Rose seemed unnecessarily subtle. Less wide-ranging but equally preoccupied with fundamentals was Vincent Buckley's *Poetry and Morality,* a close analysis of the relationship between poetic and moral greatness in regard to the theories of Matthew Arnold, T. S. Eliot, and F. R. Leavis. *Epoch and Artist,* edited by Harman Grisewood, sets forth a theory of art by compiling the occasional critical pronouncements of the artist and poet, David Jones. On a more superficial level, *Vision and Rhetoric: Studies in Modern Poetry* assembled G. S. Fraser's lively but discriminating journalistic criticism of contemporary poets great and small.

An offering in the field of applied criticism, Martin Turnell's *The Art of French Fiction: Prevost, Stendhal, Zola, Maupassant, Gide, Mauriac, Proust* did not live up to the grandiose promise of its title. Because Turnell had already given lengthy consideration to his favorites, Stendhal and Proust, in an earlier volume (*The Novel in France,* 1950), here he combined only short studies of these authors' minor works with longer essays on the other writers listed in the title.

Of the works devoted to single writers, J. B. Beer's *Coleridge the Visionary* attempted with great learning and care to demonstrate the integral contribution Coleridge's philosophy made to his poetry. Herbert J. Hunt's earlier book about Balzac (*Honoré de Balzac: A Biography,* 1957) proved to be a valuable preliminary to his study of this year, *Balzac's Comédie Humaine,* in which he discusses the development of Balzac's art as it unfolds in his great series of novels. Barbara Hardy's *The Novels of George Eliot: A Study in Form* achieved surprising results by analyzing the style and symbolism of certain of Eliot's works that some critics felt would hardly sustain such treatment. Edward Stokes, in *The Novels of Henry Green,* examines the remarkable stylistic subtlety that contributes to the great distinction of Green's works.

FRED B. MILLETT,
Emeritus Professor of English,
Wesleyan University.

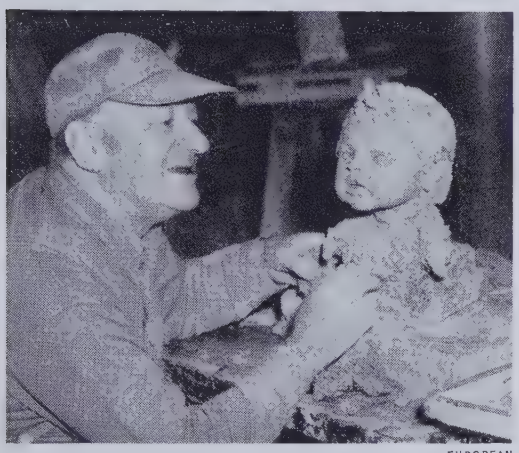
EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPSTEIN, SIR Jacob (78), British sculptor: b. New York, N.Y., Nov. 10, 1880; d. London, England, Aug. 19, 1959. At his death, Sir Jacob was still a storm center in the art world, but those who criticized as well as those who admired him recognized his eminence among contemporary sculptors. The late John Middleton Murry, famous English editor and critic, had said as long ago as

1920: "Epstein has succeeded to the position of Rodin, in the sense that to the contemporary mind, he is Sculpture."

Born on New York City's colorful lower East Side, Epstein started sketching as a boy and turned to sculpture when he was troubled by eye strain. In 1902 he went to Paris and the École des Beaux-Arts, but by 1905 had moved on to London, where he settled permanently. (He became a British citizen in 1910.) In 1907 Epstein was commissioned to do a frieze of 18 large figures for the new British Medical Association Building in London. Their unveiling in 1908 set off the first outburst of the public and artistic controversy that marked his career. Vehemently attacked by some newspapers



EUROPEAN

Sir Jacob Epstein, world-renowned British sculptor, shown here at work in his London studio, died on August 19.

and religious groups, the work was defended by the London *Times* and by artists who recognized the emergence of a gifted new vision in the plastic arts. In a succession of works, many on Biblical themes, he pursued his own intensely personal search for a true expression of his subject's reality, rejecting conventional, naturalistic forms whenever they seemed to him to detract from this reality. His statues and monuments were often of huge proportions and always of immense—and sometimes startling—vitality and power. Epstein called himself simply "an imaginative realist."

Among the better known of his large works are the marble Oscar Wilde memorial (1909) in the Père Lachaise Cemetery in Paris; a marble *Venus* (1917); *Christ* (bronze, 1920); the W. H. Hudson memorial in London's Hyde Park (Portland stone, 1925); *Genesis* (marble, 1931); *Ecce Homo* (Subiaco stone, 1933); *Adam* (alabaster, 1939); *Jacob and the Angel* (alabaster, 1942); and *Social Consciousness*, a bronze group in Philadelphia's Fairmont Park (1955).

Sir Jacob also produced a great deal of brilliant portrait sculpture—heads and busts done mostly in roughly textured bronze and all characterized by the same vigor and expressiveness. Among the many notables who sat for him were Joseph Conrad, George Bernard Shaw (an early and faithful friend), Sir Winston Churchill, Jawaharlal Nehru, Bertrand Russell, and T. S. Eliot. At his death he was at work on a half-length sculptured portrait of Princess Margaret.

In 1931 a "series of conversations on art" between Epstein and his friend, critic Andrew L. Haskell, was published as *The Sculptor Speaks*. Epstein's autobiography, *Let There Be Sculpture*, published in 1940, was revised and extended in 1955 in *Epstein: An Autobiography*. The artist was made a Knight of the British Empire in 1954.

ERITREA. An autonomous unit of Ethiopia, on the Red Sea coast of Africa. Estimated area, 48,000 square miles; pop. (est. 1950), 1,104,000. Asmara (est. pop., 120,000) is the capital. The population is mainly Coptic Christian and Moslem, and includes numerous nomadic tribes. An Italian colony before World War II, Eritrea was federated with Ethiopia in 1952, in accordance with a decision of the United Nations. Eritrea exercises home rule through an elected 68-member Representative Assembly and a chief executive chosen by the assembly. Cereals, coffee, tobacco, fruits, and dates are grown, and livestock is raised. There is also some light industrial and handicrafts production. Railroads total 191 miles. Middle East Airlines operate out of Asmara.

ESPIONAGE. See Index entry, *Subversive Activities*.

ESTONIA. An independent republic since 1918, Estonia was forcibly annexed by the USSR in 1940, and reannexed by force at the end of World War II as the Estonian Soviet Socialist Republic. The United States government does not recognize this annexation.

Area and Population.—Estonia's area is 17,370 square miles; its population (1959), 1,196,000. About 56% of the population is urban. The principal cities are Tallinn (Reval), the capital, 280,000 (1959); Tartu (Dorpat), 74,000 (1959); Pärnu, 36,300 (1956); Narva, 21,300; and Kohtla-Järve, 30,000 (1950). About 80% of the people are Estonians, a highly Europeanized ethnic group of Finno-Ugrian origin. Russians constitute the largest racial minority. The predominant religion is Lutheran.

Government.—The Estonian legislature consists of a single-chamber Soviet of 125 deputies elected for four-year terms. It rarely meets, and in the interim delegates its authority to an 8-man Presidium headed by Johann G. Eichfeld. There is also a Council of Ministers (cabinet) headed by Premier A. A. Müürisepp. The Estonian government has no political autonomy, however, and its chief function is to execute orders from the Kremlin. All key government posts are held by members of the Estonian Communist Party, which is headed by First Secretary Johannes G. Kabin.

Finance.—The 1959 governmental budget provided for the expenditure of 2,612,267,000 rubles ($653,066,750), an increase of 238,267,000 rubles ($59,566,750) over 1958.

Education.—School enrollment in 1959 totaled about 161,000, including 12,000 college students.

Transportation.—There are 905 miles of main railways and 433 miles of secondary lines. Although Estonia has 20 ports, Tallinn handles about 80% of all ocean-going traffic. Airlines link Tallinn with Moscow, Leningrad, and Riga.

Economy.—In 1959, Estonia's agriculture was largely collectivized. Of the 1,830,000 acres under cultivation, 68% was in 807 collective farms, 20% in state farms, and 12% in the gardens of factories and rural residents. The total acreage was smaller than before World War II and before Joseph Stalin's death. The chief crops are grain, potatoes, and flax. The Seven-Year Plan (1959–65) calls for Estonian agriculture to concentrate on livestock raising. The output of farm produce in 1965 is planned to increase over 1958 by the following percentages: grain, 60–80; potatoes, 90; other vegetables, 70; fiber flax, 80; meat, 60; milk, 80–90; and butter, 80.

The 1959 output of oil-bearing shale, Estonia's largest industry, was about 9 million metric tons, most of which was converted into gas and piped into Leningrad and Tallinn. The output of electricity was 1.4 billion kw.-hr., and the fish catch was 59,000 tons. The Seven-Year Plan calls for the production in 1965 of 16.5 million tons of oil shale, 6.4 billion kw.-hr. of electricity, and 130,000 tons of fish. The following percentage increases in 1965 output over 1958 also are planned: all industry, 80;

machinebuilding, 130; and cement, 500. The plan concentrates mainly on the expansion of the oil-shale, chemical, electric power, machinebuilding, textile, and fishing industries. In addition, 1,650,000 square meters of new government housing will be built.

Principal Events, 1959.—During 1959 the Estonian Communist press and government leaders constantly accused the public of bourgeois prejudices, chauvinism, bourgeois nationalism, worship of the capitalist past, and ideas of revising Marxism. This campaign reflected the prevailing unrest of the Estonian people against Russian rule, Communist persecution of the Lutheran religion, and the very low Soviet standard of living.

Refugees constantly escaping from Estonia report that the islands of Hiiumaa (Dagö), Saaremaa (Ösel), Ruhnu (Runö), Naissaar (Nargo, Nargen), and Muhu (Moon) have been converted into bases for long-range rockets. The Soviet Baltic Navy has transferred its main base from Kronstadt in Leningrad Harbor to the Estonian port of Tallinn.

ELLSWORTH RAYMOND,
USSR Area Specialist and Associate Professor of Government, New York University.

ETHIOPIA. An empire in eastern Africa. Estimated area, 457,300 square miles; pop. (est. 1957), 20 million (estimates vary widely). Chief cities: Addis Ababa, the capital (est. 400,000); Asmara, capital of Eritrea (120,000); and Diredawa, 40,000. The Amhara, the ruling minority, live chiefly in the central highlands. The Galla, forming somewhat less than half the population, are of Hamitic descent. Pastoral Danakil, Somali, and other Hamitic groups inhabit the east, and Nilotic tribes the southwest. Amharic is the official language, but many different languages and dialects are spoken by the various groups.

Government.—Emperor Haile Selassie I (b. 1891; crowned king 1928, emperor 1930) exercises virtually absolute power, although some steps have been taken recently toward democratic government. Under the 1955 constitution, the ministry was made partially responsible to Parliament, and the Chamber of Deputies was given a role in fiscal affairs. The emperor retains the power of veto over legislation. The Chamber of Deputies consists of 220 members elected by the people. The Senate is appointed by the emperor and may not exceed half the number of deputies. Eritrea (q.v.), federated with Ethiopia in 1952, has considerable autonomy in domestic affairs.

The Ethiopian Army obtains equipment from the United States and is trained by a United States military mission. United States advisers direct the state bank and aid in education, agricultural development, and other spheres. British nationals assist in the judiciary, customs, police, and schools. Italians, Yugoslavs, West Germans, and other nationals provide technical assistance in industry, construction, transport, and other fields.

Education and Religion.—Well over 90% of the population is illiterate and less than 5% of the school-age population attends school. In 1956 there were 610 public schools on all levels; primary pupils numbered 135,642; secondary, 2,628; technical, 1,435; teacher-training, 800. There are also many Coptic Church schools and other private schools. University College at Addis Ababa had 350 students in 1958–59. The Ethiopian Coptic Church is the state church, but other faiths are tolerated. Moslems are numerous in the south and east.

Finance.—The estimated budget (ordinary and extraordinary) for the fiscal year 1955–56 was: revenue, Eth. $115,010,000; expenditure, Eth.$130,410,000. Revenue derives largely from customs duties. The Ethiopian dollar equals U.S.$0.40.

Transportation and Communications.—Ethiopia has about 2,900 miles of all-weather roads and 6,000 miles of roads passable in the dry season. A road construction program is under way, aided by loans from the International Bank for Reconstruction and Development. The 487-mile Addis Ababa–Djibouti (French Somaliland) railroad runs for 421 miles in Ethiopian territory. The Massawa-Agordat railroad in Eritrea totals 191 miles. Domestic air service is provided by the government-owned Ethiopian Airlines, Inc. (operated by Trans World Airlines). Passenger cars in 1958 numbered 11,397; telephones, 8,422; daily newspapers, 5 (1956; total circulation: 10,000).

In full military regalia, Emperor Haile Selassie (right) and President Tito of Yugoslavia salute troops in Addis Ababa during Tito's visit to Ethiopia on February 3–12.

UPI

Production.—Over 90% of the population is engaged in subsistence farming or livestock raising. Despite an abundance of good land, the primitiveness of technique and inadequacy of transport make for low output levels. Chief food staples are teff, barley (est. 1957 output: 510,000 metric tons), wheat, corn, and durra. Pulses and oilseeds are also raised (est. annual linseed output: 50,000 metric tons). The large herds of cattle, sheep, and goats yield hides, skins, and other animal products. Coffee is the major commercial crop and the principal source of cash income; exportable output in 1958–59 totaled 700,000 bags (132.3 pounds each). Manufacturing is mainly confined to items for local consumption, such as cement, bricks, flour, beer, cheap cotton textiles, shoes, soap, and tobacco products. Manufacturing establishments with 10 or more workers numbered 144 in 1956; employees totaled 18,600; gross value of output was Eth.$72.6 million.

Foreign Trade.—Exports in 1958 totaled Eth. $143.4 million (down 25% from 1957); imports, Eth.$197.1 million (up 10%). Chief exports and values in 1958 were: coffee, Eth.$84.1 million; hides and skins, Eth.$15.4 million; oilseeds, Eth. $11.7 million; and cereals, Eth.$6.9 million. Imports are mainly cotton piece goods and cotton manufactures, motor vehicles, foodstuffs, and other manufactures. Ethiopia's principal trading partners are India, the United States, Japan, and Italy.

Principal Events, 1959.—Ethiopia's business depression, caused by the slump in world coffee prices, continued in 1959, and foreign aid played a greater role than in many previous years. On March 18, Addis Ababa announced that West Germany had agreed to extend credits of 30 million Deutsche marks for the purchase of machinery and agricultural equipment. The U.S. Development Loan Fund on August 6 granted a $500,000 loan for the construction of a textiles plant at Asmara, and United States gift shipments of 9,500 tons of wheat and 17,000 tons of sorghum helped alleviate famine in areas hit by locusts and drought.

Emperor Haile Selassie began a two-month international tour with a visit to the United Arab Republic on June 24–28. The emperor discussed division of the Nile waters with UAR President Nasser in Cairo, and negotiated a settlement with Coptic Church Patriarch Kyrillos VI of a dispute between the Egyptian and Ethiopian branches of the church. During his visit to the Soviet Union, June 29–July 13, the emperor obtained a low-interest Soviet loan of 400 million rubles for Ethiopian agricultural and industrial development. The emperor also visited Czechoslovakia, Belgium, France, and Portugal. He concluded his tour with

a visit to Yugoslavia, returning President Tito's visit to Ethiopia in early February.

In early December, clashes took place in the Ogaden area, adjoining British Somaliland, between nomadic Somali tribesmen from Ethiopia and British Somaliland. Twenty-six persons were reported killed in the border area, which is in dispute and has been the site of several intermittent clashes in recent years.

EUROPE. A continent of the Eastern Hemisphere. Estimated area (exclusive of USSR and European Turkey), 1,903,000 square miles; pop. (est. 1958), 418 million (exclusive of USSR). (See articles on individual European countries, and the Index entry, *Europe.*)

EUROPE, Council of. See COUNCIL OF EUROPE.

EUROPEAN ATOMIC ENERGY COMMUNITY. This agency, authorized, like the European Economic Community (q.v.) by the Rome treaties of March 25, 1957, forms along with it and the older European Coal and Steel Community (q.v.) a complex of organizations linking France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg ("the Six"). The three communities have separate executives, but they also have joint organs in the 142-member European Parliamentary Assembly, the Council of Ministers, and the Court of Justice.[1] (See EUROPEAN ORGANIZATIONS.)

Euratom (as it is often called) came formally into being on Jan. 1, 1958, but 1959 was its first real approach to a normal working year. And even this was a year of plans and beginnings, rather than of concrete achievements. Conditions were certainly unfavorable. The large surplus of coal available, which was causing such embarrassment to the Coal and Steel Community, offered little encouragement to go ahead with the construction of new and enormously expensive plants for the production of new forms of fuel—especially since these new plants would be subject to speedy obsolescence. The strong arguments on the other side—that Europe's economic growth was such that any fuel surplus was purely temporary, and that the supply of oil from the Middle East was precarious, fell on inattentive ears.

Nevertheless, some substantial progress was made. Steps were taken to implement the 1958 agreement between Euratom and the United States. On Aug. 16, 1959, the Export-Import Bank of Washington announced the signing of agreements under which credits totaling $135 million would be available to Euratom, to assist in financing purchase of United States-type nuclear power reactors to be installed in plants in member countries. After a period of pessimism in the spring and summer, when it seemed that much of the program might fall by the wayside, agreement was achieved in October on the building of atomic power plants in Italy, in Holland, in Germany, on the Meuse River between France and Belgium, and (where the need for a new source of fuel was greatest) in West Berlin. These five stations, however, were a reduction of the original plans for six, and the total capacity envisaged—750 megawatts—was a far cry from the first grandiose plans for a capacity of 15,000 megawatts.

Although Great Britain (like the United States) is not a member of the community, a United Kingdom–Euratom agreement for cooperation on peaceful uses of atomic energy was signed on Feb. 4, 1959, and cooperation on the "Dragon" project in Dorset[2] was going well.

ARTHUR C. TURNER,
Professor of Political Science,
University of California, Riverside.

EUROPEAN COAL AND STEEL COMMUNITY. The ECSC came into being in 1952 to provide its six member nations—France, Italy, West Germany, Belgium, the Netherlands, and Luxembourg—with a common and free market for coal, iron, steel, and steel products. (For the structure of the ECSC, see EUROPEAN ORGANIZATIONS.)

The year 1959 brought the organization face to face with a critical test, whose outcome was deeply disappointing to supporters of the community. The central point was whether the member governments would accept the right of the community's High Authority to infringe sovereignty by imposing, in the interests of the community as a whole, policies which might be unwelcome to particular countries. This has always been the question in the minds of those who contemplated the seemingly formidable supranational powers of the High Authority. Although the existence of the community is not threatened, and the powers of the High Authority remain theoretically the same, it has suffered a severe setback in the refusal of member governments—particularly France and West Germany—to rise above national viewpoints to a "European" one.

The crisis arose out of excessive coal production within the six nations, a situation already serious in 1958. Statistics for the year 1958 showed that although production remained practically unaltered (247 million metric tons), demand was 11% lower than anticipated. Unsold stocks at the mines mounted from 12.3 million metric tons in April 1958 to 28.3 million in April 1959. The difficulties bore most severely upon the Belgian mines, economically the least efficient within the community.

To complicate matters, the term of the High Authority expired on Feb. 10, 1959, but the member governments repeatedly postponed appointing new members and the existing body had to carry on. In March the High Authority put forward a comprehensive four-point emergency program calling for a cut in imports, regulation of production, freezing of mine stocks, and the maintenance of miners' incomes. This program was disapproved by the Consultative Committee (which lacks the power of veto); accepted (April 14–16) by the European Parliamentary Assembly; and finally rejected (May 14) by the Council of Ministers. The Benelux countries voted for it, but France, West Germany, and Italy voted against it; such a decision needed four votes, including that of either Italy or West Germany, for acceptance.

The High Authority thereupon devised a stopgap series of temporary measures to deal with the problem of the Belgium mines. On June 24, Paul Finet of Belgium announced that he would not accept re-election as president. On September 11, the six governments named a new executive body with Piero Malvestiti (Italy) as president. Some continuity of policy was perhaps indicated as likely

[1] Étienne Hirsch (of France) was appointed president of Euratom's Commission on Feb. 2, 1959, succeeding Louis Armand. The Commission moved into a new 11-story headquarters building in Brussels, Belgium, during the year.

[2] The "Dragon" project for construction of a new type of nuclear power plant is under the joint sponsorship of Euratom, the United Kingdom, Austria, Denmark, Norway, Sweden, and Switzerland.

by the continued service of Finet as an ordinary member and the retention as first vice president of Dirk Spierenburg (Netherlands). The general dilemma of the nationalist assault, led by France, on the powers of the High Authority remained unsolved.

The other half of the community's activities, steel production, was booming throughout 1959. Output of crude steel in September (5.5 million metric tons) was the highest for any one month up to that time. Whereas coal production for the first nine months of 1959 was down 6% from 1958, steel output increased by 4.7%. Stocks of coal reached a maximum of 32 million metric tons in August and thereafter leveled off as increased demand and reduced supply began to balance.

(See also IRON AND STEEL.)

Professor of Political Science,
University of California, Riverside.

EUROPEAN ECONOMIC COMMUNITY. Authorized by treaties signed at Rome on March 25, 1957, the European Economic Community, sometimes called the Common Market, formally came into existence on Jan. 1, 1958, but had its first actual working year in 1959. Along with the European Atomic Community (Euratom) and the European Coal and Steel Community (qq.v.), the economic community links France, Italy, West Germany, Belgium, the Netherlands, and Luxembourg. Its goal is to stimulate economic advances among the member nations by removing trade barriers. (For an outline of the community's structure, see EUROPEAN ORGANIZATIONS.)

The first modest step in carrying into practice the objectives of the community was taken on Jan. 1, 1959, when a 10% cut in tariffs and an average increase of 20% in import quotas were put into force. No obvious ill effects followed this measure; indeed, the member countries shared in the general economic upswing in the second half of 1959. The real test of member countries' economies, and of their reactions to the community, however, will come with the successive reductions in trade restrictions scheduled for subsequent years.

On May 6 the Council of Ministers (a common organ of the three communities) approved a $29.5 million budget for 1959 for the Common Market and Euratom, of which the Common Market's share was some $20 million. The Council of Ministers also took a step toward enlarging the community by approving the applications of Greece (July 25) and Turkey (September 11) to become associated with the community. It was not immediately clear, however, precisely what status an "associate member" would have.

Among proposals for future development of the Common Market, two are of particular moment. First, it is envisaged as possible that the European Parliamentary Assembly (a joint body of the three communities), at present chosen by and from the national parliaments of the members, might be elected directly by universal suffrage in the member countries. Senator Fernand Dehousse (Belgium), chairman of the committee which deals with the subject, said in May 1959 that direct elections might take place in 1962. Second, an acceleration of the various steps in reducing trade barriers between member countries, so that the elimination of trade barriers within the community would be completed by 1966 instead of 1970 or 1973, was proposed to the Council of Ministers in October by Belgium.

In December 1958 the community rejected (because of French opposition) the British proposal for a free trade area which would embrace, in addition to the six Common Market nations, the 17 member countries of the Organization for European Economic Cooperation (OEEC). Fearing the effect of the Common Market on their own commerce, the so-called Outer Seven countries (Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom) then turned to the creation of the European Free Trade Association among themselves. A preliminary agreement was reached in the Stockholm Plan (July 21, 1959), and a formal agreement among the Outer Seven was initialed on November 20. It was thus all too true, as *The Times* of London said on September 16, that European trade plans were "at Sixes and Sevens."[1] Among those who were most unhappy at the prospective division of western Europe into two trade camps was Dr. Ludwig Erhard, German economics minister, who used the slogan "6 + 7 + 5 = 1" to indicate that Europe's economic health demanded the intimate cooperation of the six Common Market countries, the Outer Seven, and the less-developed peripheral countries (Iceland, Ireland, Greece, Turkey, and Spain).

EUROPEAN FREE TRADE ASSOCIATION. The convention establishing the European Free Trade Association (EFTA) was initialed in Stockholm, Sweden, on Nov. 20, 1959, by the so-called Outer Seven countries (Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom). A preamble to the convention stated that formation of the limited free-trade area was designed primarily as "a step toward an agreement" for a larger multilateral association among the 18 countries belonging to the Organization for European Economic Cooperation (OEEC). The convention described the objectives of the EFTA as the maintenance of full employment in the member nations, assurance of fair trade competition among the members, and development of world trade through the reduction of trade barriers. The members agreed to institute progressive mutual reductions in tariffs which would lead to their abolition by 1970 (excepting Portugal, which may extend its reductions to 1980). (For a discussion of the association's tariff policies, see INTERNATIONAL TRADE; TARIFFS.)

EUROPEAN MONETARY AGREEMENT (EMA). An agreement signed on Aug. 5, 1955, by members of the Organization for European Economic Cooperation (OEEC). The EMA came into force on Dec. 27, 1958, on which date most of the countries in the European Payments Union (EPU) made their currencies convertible for nonresidents, and the EPU was liquidated. The purpose of the EMA is to provide a multilateral system of balance-of-payments settlements among member nations and to ensure the effectiveness of intra-European trade liberalization measures. To aid in this purpose, a European Fund came into operation on Jan. 15, 1959, as the successor institution to the EPU, and received the balance of the capital funds of the EPU. The European Fund provides short-term credits (not exceeding two years) to member nations to assist them in temporary balance-of-payments difficulties. Up to Sept. 30, 1959, drawings on credits granted by the fund totaled only $32

[1] However, on November 24 "the Six" agreed to extend to other Western countries the mutual quota (but not tariff) concessions due to come into force on Jan. 1, 1960.

million ($24 million by Spain and $8 million by Turkey). Operation of the EMA is supervised by a 7-member board of management, which is named by the OEEC Council and is guided by the council's decisions.

EUROPEAN ORGANIZATIONS. The following international organizations are designed to achieve collective or cooperative action in political, military, economic, and other fields.[1]

Council of Europe.—Statute signed by 10 states in London, May 5, 1949. Purpose: to promote European unity through recommendation. Membership (1959), 15 states (see accompanying table). Headquarters: Strasbourg, France. Chief organs:
(1) Committee of Ministers (15)
(2) Consultative Assembly (135)
(3) European Court of Human Rights

European Atomic Energy Community (Euratom).—Treaty signed in Rome, March 25, 1957 (came into force Jan. 1, 1958). Purpose: to cooperate in atomic research and development. Membership: 6 states (see accompanying table). Headquarters: Brussels, Belgium. Chief organs:
(1) European Parliamentary Assembly (142)
(2) Court of Justice (7)
(3) Council of Ministers (6)
(4) Commission (5)
(5) Economic and Social Committee (101)
(6) Scientific and Technical Committee (20)

European Coal and Steel Community (ECSC).—Treaty signed in Paris, April 18, 1951 (came into force July 25, 1952). Purpose: to establish a free trade area in coal and steel. Membership, 6 states (see accompanying table). Headquarters: Luxembourg. Chief organs:
(1) European Parliamentary Assembly (same as that of Euratom)
(2) Court of Justice (same as that of Euratom)
(3) Council of Ministers (6)
(4) High Authority (9)
(5) Consultative Committee (51)

European Economic Community (or **European Common Market**).—Treaty signed in Rome, March 25, 1957 (came into force Jan. 1, 1958). Purpose: to eliminate trade barriers and link the economies of member nations. Membership: 6 states (see accompanying table). Greece was approved as an associate member on July 25, 1959; Turkey, on Sept. 11, 1959. Headquarters: Brussels. Chief organs:
(1) European Parliamentary Assembly (same as that of Euratom)
(2) Court of Justice (same as that of Euratom)
(3) Council of Ministers (6)
(4) Commission (9)
(5) Economic and Social Committee (same as that of Euratom)

European Free Trade Association (EFTA) or **Outer Seven.**—Convention initialed in Stockholm, Sweden, Nov. 20, 1959. Purpose: to establish a free trade area among member nations. Membership, 7 states (see accompanying table). Headquarters: Paris.

North Atlantic Treaty Organization (NATO).—Treaty signed by 12 states in Washington, April 4, 1949. Membership (1959), 15 states (see accompanying table). Chief organs:
I. North Atlantic Council (15); headquarters, Paris
II. Military Committee (14)[2]
A. Standing Group (3); headquarters, Washington
1. European Command
2. Atlantic Ocean Command
3. Channel Committee and Channel Command
4. Canada–United States Regional Planning Group
5. Other military agencies:
a. NATO Defense College (Paris)
b. Military Agency for Standardization (MAS)
c. European Military Communications Coordinating Committee (EMCCC) and other communications agencies
d. Advisory Group on Aeronautical Research and Development (AGARD)
III. International Staff/Secretariat; headquarters, Paris

(Note: for a more detailed outline of NATO's structure, see NORTH ATLANTIC TREATY ORGANIZATION.)

Organization for European Economic Cooperation (OEEC).—Convention signed in Paris, April 16, 1948. Membership (1959), 18 states (see accompanying table). On July 20, 1959, Spain became a full member of the OEEC. Headquarters: Paris. Chief organs:
(1) Council (18)
(2) Executive Committee (7)
(3) Secretariat

[1] Articles on Council of Europe, Euratom, European Economic Community, ECSC, NATO, and WEU will be found under their own headings.

[2] Iceland has no military representative, but may be represented by a civilian.

Western European Union (WEU).—Based on the former Brussels Treaty Organization created under the Brussels Treaty, signed on March 17, 1948, by the United Kingdom, France, Belgium, the Netherlands, and Luxembourg. On May 5, 1955, protocols signed in Paris on Oct. 23, 1954, came into force, transforming the Brussels Treaty Organization into WEU, with the Federal Republic of Germany and Italy as additional members. Chief organs:
(1) Council (7)
(2) Assembly (89)
(3) Civilian secretariat; headquarters, London

EUROPEAN UNION. See WESTERN EUROPEAN UNION.

EVENTS OF 1959. See the CHRONOLOGY at the front of this volume.

EXCHANGE RATES. In parallel measures announced on Dec. 29, 1958, most western European nations modified their exchange systems to permit nonresidents to exchange freely their holdings of the currencies of these countries for any other currency, including dollars. The western European move to external (nonresident) convertibility had an immediate impact in early 1959 on foreign exchange systems and markets around the world. Sixteen other countries, most of which were associated in a monetary area with one or the other European countries, promptly made similar adjustments in their exchange regulations. Switzerland, for example, abolished controls on payments for those countries and monetary areas that established external convertibility.

These new arrangements were not extended to all accounts—the principal exceptions being bilateral payment agreements and withdrawals of capital holdings—nor did they grant residents the right to obtain foreign exchange freely. During 1959, however, a number of countries did increase the exchange convertibility permitted to residents and, in the Federal Republic of Germany, the Deutsche mark was convertible for both residents and nonresidents.

The table on page 248 provides data on par values of currencies of various countries.

Important changes in exchange rate systems and practices within certain countries during 1959 are summarized below.[1] The exchange rates given are uniformly expressed in national currency units per U.S. dollar.

Argentina.—A single exchange market for all transactions replaced the previous system of multiple rates. The new system was put in operation on Jan. 12, 1959, and the

[1] For a more detailed account of exchange rate changes and for current information on exchange rate systems in general, consult *International Financial Statistics*, published monthly by the International Monetary Fund.

[1] Par value not yet established. [2] No transactions in the exchange market take place at rates governed by the par value last agreed with the International Monetary Fund. [3] No substantial transactions in the exchange market take place at rates governed by the par value. [4] Not all transactions in the exchange market take place at rates governed by the par value.

unified exchange rate was quoted at 67 pesos per dollar. The rate depreciated during the year and was at about 83 pesos in November 1959.

Brazil.—During 1959 there was a significant devaluation in the exchange rate for both exports and imports. On Jan. 10 and July 1, 1959, export goods were reclassified into fewer categories, and the effective exchange rates (that is, official rate plus export bonus) for these categories were increased. The coffee export rate, for example, was raised from 37 to 60 cruzeiros per dollar in January and to 76 cruzeiros in July. Cocoa beans and certain derivatives received rate increases from 43 to 70 and then to 76 cruzeiros per dollar. Similarly, all other exports were made subject to a fixed rate of 100 cruzeiros or shifted to the fluctuating free market rate (about 194 cruzeiros in November 1959). Exchange for most imports continued to be made available (sold) in public auctions. This system was simplified following the introduction of nonresident convertibility for the European currencies. On Jan. 21, 1959, auctions of ACL (area of limited convertibility) dollars[2] and U.S. dollars were combined.

Chile.—On Jan. 27, 1959, the two fluctuating exchange markets, which had been established in 1956, were combined into a single market. The new single rate was quoted initially at 1,051 pesos per dollar, which was midway between the former free rates for trade and for financial transactions. During most of 1959 the exchange rate was about 1,053 pesos.

Cuba.—In late September 1959 exchange taxes were imposed on imports of less essential and luxury goods. The taxes ranged from 30% to 100% of the value of the import and applied to about 15% of imports.

Indonesia.—On Aug. 25, 1959, the export certificate system was abolished and a new basic exchange rate of 45 rupiah per dollar was established. Exports and most invisible receipts were subject to a 20% exchange tax, resulting in an effective buying rate of 36 rupiah. Imports considered essential to the economy were made at the basic exchange rate, but all others were subject to surcharges ranging from 25% to 200%.

Philippines.—Beginning July 17, 1959, a 25% margin over the official selling rate of 2.015 pesos per dollar applied to sales of exchange for most payments. About 16% of total imports were exempted from this tax and continued to be made at the official rate.

Spain.—A par value of 60 pesetas per dollar was agreed on with the International Monetary Fund on July 18, 1959. On the same date, a unified exchange system was introduced, replacing the multiple rate system which had been in effect since April 1957.

Turkey.—The system of rates in effect since August 1958 was simplified on Aug. 16, 1959. The special exchange rate for exports of opium, tobacco, and copper was abolished, thus reducing from three to two the number of buying rates. As before, a single selling rate of 9.02 liras per dollar applied to all imports and invisibles.

R. L. PRAETORIUS,
Economist, International Monetary Fund.

EXPORT-IMPORT BANK OF WASHINGTON. During the fiscal year 1959, in fulfillment of its basic purpose of facilitating and assisting in the financing of the overseas trade of the United States, the bank authorized 123 credits totaling $885.2 million to borrowers in 28 countries. As of June 30, 1959, the bank had 1,072 loans to 56 countries in its portfolio. The loans extended by the bank were both for development projects and for assisting United States suppliers to complete individual sales of United States equipment abroad.

During the fiscal year 1959, 209 credits totaling $131 million were authorized to meet the needs of overseas private enterprise for United States equipment and services. In addition, 27 credits totaling $480 million were made to governments or agencies of governments. These credits were given to finance exports of United States goods and services to 12 American republics, and to six countries in Europe, eight in Asia, and two in Africa.

Loans in local currency to private enterprise in other countries pursuant to Section 104(e) of the Agricultural Trade Development and Assistance Act of 1954, as amended, were made in 11 countries in amounts aggregating the equivalent of $30.8 million.

In the fiscal year 1959 the bank reentered the field of hotel financing and agreed to consider applications for dollar loans to be available only for the purchase of United States materials, equip-

[2] Currencies of the so-called Hague Club, a group of western European countries which have an agreement with Brazil whereby Brazilian earnings from transactions with each country would be pooled and made interchangeable.

ment, and services. Under certain circumstances the bank will also consider local currency loans in those countries where such currency is available.

The capital stock of the bank, amounting to $1 billion, is held by the U.S. Treasury. In addition, the bank is authorized to borrow from the Treasury amounts up to $6 billion, thus placing a ceiling of $7 billion on the loans and guaranties which it may have outstanding at any one time. On June 30, 1959, the bank had in its portfolio loan authorizations and guaranties totaling approximately $4.8 billion, leaving an uncommitted lending authority of approximately $2.2 billion.

For the fiscal year 1959 the bank's net income was $85.4 million, out of which the bank paid a dividend of $22.5 million to the Treasury, adding the balance of net earnings ($62.9 million) to its reserve for contingencies, which at the close of the fiscal year amounted to $549.8 million.

The cumulative total of credit authorizations as of June 30, 1959, was $10.2 billion. Total loans outstanding amounted to $3,462,562,963, and the unutilized portion of established active credits was $1,301,160,874.

EDWARD S. CONGER,
Acting Secretary,
Export-Import Bank of Washington.

FAEROE (or FAROE) ISLANDS. A group of 21 islands (18 inhabited) in the North Atlantic between the Shetland Islands and Iceland. Area, 540 square miles; pop. (1955), 32,380. Thorshavn (4,390) is the capital and chief city. The Faeroe Islands are a Danish possession, but the Faeroese exercise home rule through their own Diet and executive. The chief occupations are sheep raising and fishing (1957 fish catch, 105,600 metric tons). On April 27, 1959, a 3-year Anglo-Danish agreement on fishing limits was signed in Copenhagen, recognizing Faeroese control of waters within 12 miles of the coast. British trawlers were barred from fishing within 6 miles of the coast, but were permitted to operate between the 6- and 12-mile limits, subject to certain restrictions.

FAIRS AND EXHIBITIONS. The following article reviews major fairs and exhibitions in 1959 under two headings: (1) Agricultural Fairs; and (2) International Trade Fairs. For a reference guide to related subjects, see the Index entry, *Shows.*

Agricultural Fairs

During the past year or two some critics have declared that state and county fairs are going in too heavily for entertainment and are neglecting the basic idea of fairs, which is to provide an exhibition that will further the interests of the rural population by encouraging improvements in agriculture, horticulture, and livestock. A check of these charges indicates they are baseless. While entertainment has steadily increased, most fairs have also expanded their farm and home exhibits, adding new features to build interest in rural home life. Better entertainment brings larger audiences for all exhibits, as attested by the fact that sales of farm and home equipment through the country's 2,500 fairs now mount high into the millions.

In spite of heat, rain, and polio scares, the 1959 fair season in the United States and Canada was generally satisfactory, and where good weather prevailed, new attendance records were set. The Minnesota State Fair at St. Paul, and the Los Angeles County Fair at Pomona, Calif., were in the million-attendance class, and the California State Fair at Sacramento was also high among the leaders, with 915,000 attendance. The Wisconsin State Fair at Milwaukee, which had as its feature attractions the Ringling Bros.–Barnum & Bailey Circus and Tennessee Ernie Ford, in ten days drew more than 700,000 attendance. The Illinois State Fair at Springfield, which featured Fred Waring and his Pennsylvanians and a "Grand Ole Opry" unit, drew over 320,000 in spite of rain on four days. Other top fairs were the Michigan State Fair (Detroit), with close to 800,000; New York State Fair (Syracuse), over 500,000; Nebraska State Fair (Lincoln), about 300,000; Iowa State Fair (Des Moines), over 400,000; Indiana State Fair (Indianapolis), about 475,000; Colorado State Fair (Pueblo), 290,000; and Missouri State Fair (Sedalia), 525,000.

The Texas State Fair (Dallas), the only United States fair that draws more than two million people, enjoyed record attendance in 1959. Its attractions included Red Foley, Mitch Miller, Herb Shriner, the McGuire Sisters, and a horse show offering $34,000 in premiums in the fair's new $2-million Coliseum seating 7,000.

Canada, with some 600 fairs, had a good year in 1959, but no record-breaker. Although most of its fairs are small, it also has some very large ones, including the largest on the continent, the Canadian National Exhibition, at Toronto, Ont. The exhibition in 1959 fell 50,000 short of its 1958 attendance mark of 2,960,000, largely because of rain and the prevalence of polio. In the West, the Pacific National Exhibition (Vancouver, B.C.) tallied 880,000; Regina Provincial Exhibition (Regina, Sask.), over 200,000; and the Edmonton Exhibition (Edmonton, Alta.), 396,000. In eastern Canada, the Central Canada Exhibition (Ottawa, Ont.) drew 525,000, and the Quebec Provincial Exhibition (Quebec), nearly 450,000.

Many fairs continue to expand their facilities. The Calgary (Alberta) Exhibition and Stampede in 1959 completed improvements valued at $2 million. Tulsa (Okla.) State Fair added a huge new exhibit building, and the Ohio State Fair (Columbus) expanded its facilities with a $450,000 arts and crafts building.

International Trade Fairs

Interest in international trade fairs reached a high point in the United States during 1959 with the holding of fairs in Houston, Los Angeles, Portland (Oreg.), New York, and Chicago. Numerous foreign governments participated with collective national displays to keep their products before the American consumer and to increase their share of the American market. The six-nation European Economic Community (q.v.) exhibited at fairs in Chicago, New York, and Portland.

In Europe the international trade fair continued as an important market place among the nations. Although the large "horizontal" type samples fairs, such as those in Paris and Milan, continued to draw large attendance, a trend toward the specialized or "vertical" type show devoted to one industry or one field of endeavor was noted.

The United States government continued its program of active participation in international trade fairs on a partnership basis with private industry by presenting exhibits at 11 trade fairs and two "solo" exhibits. Displays of American products and services were organized by the U.S. Department of Commerce at fairs in Bari, Italy; Barcelona, Spain; Casablanca, Morocco; New Delhi, India; Lima, Peru; Paris, France; Poznań, Poland; Salonika, Greece; Tokyo, Japan; Tunis, Tunisia; and Zagreb, Yugoslavia. The "solo" exhibits were held in Calcutta and Madras, India.

Seeking to demonstrate how the requirements of modern living are served by a free and competitive enterprise, the United States exhibits featured tools for small industries in India; a full-scale American food supermarket in Spain; a "Main Street" of stores, including a typical American pharmacy, in Poland; color TV in Yugoslavia; and solar energy equipment in Tunisia. Since the initiation of the program of government participation in trade fairs abroad in 1954, there have been 73 official exhibits in 27 countries, participated in by 5,000 American contributors from private industry, and seen by more than 50 million persons.

In addition to the official exhibits, the Department of Commerce sent trade missions to 13 countries and organized 15 trade information centers at trade fairs throughout the world. The missions, directed by a government official and including three or four businessmen chosen from the executive and operating levels of private industry, spent from four to eight weeks abroad visiting important commercial centers.

The exchange of national exhibits in the fields of science, technology, and culture by the United States and the Soviet Union in 1959 created international interest and drew large crowds. The Soviet Exhibition of Science, Technology, and Culture was staged in the Coliseum in New York City, June 30–August 10, while the American National Exhibition in Moscow was held in Moscow's Sokolniki Park, July 24–September 4.

Seattle, Wash., proceeded with plans to hold an international science exposition, April 21–Oct. 21, 1962, to be known as Century 21 Exhibition; and a three-member commission appointed by President Eisenhower recommended New York City as the site of the next world's fair in the United States, tentatively set for 1964. Washington, D.C., and Los Angeles had also sought approval as the world's fair site.

On December 11, President Eisenhower opened

FALKLAND ISLANDS. The Falkland Islands (aggregate area, 4,618 square miles) lie in the South Atlantic Ocean about 480 miles northeast of Cape Horn and form a British crown colony consisting of two principal islands—East Falkland (2,580 square miles with adjacent small islands), on which is Stanley, the capital and only town (est. pop., 1,135); and West Falkland (2,038 square miles with adjacent islands)—and a number of smaller islands and islets. In the Camp, as the countryside other than Stanley is known, the largest settlement (est. 100) is Darwin, East Falkland. There are two dependent island groups: (1) South Georgia (area, 1,450 square miles), the South Orkneys (240 square miles), and South Sandwich (130 square miles); and (2) the South Shetlands (1,800 square miles), and Palmer Peninsula (called Graham Land by the British) and Coats Land, which form part of the Antarctic continent. The all-European population on East and West Falkland, excluding dependencies, was estimated in 1958 at 2,253, exclusive of the whaling settlement on South Georgia, which fluctuates with the whaling season and in 1958 numbered 1,265.

A governor (Sir Edwin P. Arrowsmith, assumed office on April 25, 1957) is assisted by an 8-member Executive Council and an 11-member Legislative Council. Revenue in 1958–59 was estimated at £303,705; expenditure, at £309,453. Under a revised development program calling for the expenditure through 1958 of an estimated £16,886, progress was made on roads, which in Stanley total 12 miles. Education is compulsory. Government schools in Stanley had 147 pupils in 1958, including an all-range school with a continuation class for pupils over 14. At Darwin a boarding school has accommodation for 39 boarders as well as for day children; a smaller boarding school, at Port Howard, West Falkland, was completed in 1957. In 1958 there were also 11 one-room settlement schools and 9 traveling teachers who visit children in their homes. Expenditure on education in 1958–59 was estimated at £34,304. Maternal and infant welfare clinics are held at the hospital in Stanley.

On the principal islands sheep farming is the leading industry (sheep numbered 611,421 in 1958); in the dependencies, whaling and sealing, principally at South Georgia (3 stations in 1958–59). Hides and skins are exported to the United Kingdom, and live sheep (1,033 in 1958) to Chile. Aggregate imports were valued at £2,568,763 in 1958; exports, at £4,773,256. There is an internal government air service, which includes the transport of urgent hospital cases to Stanley and the experimental oversowing of grass seed. A ship of the Falkland Islands Company and a government motor vessel furnish interisland transport, and the former also conveys passengers and mail to South America.

FAR EAST. During most of 1959 the Far Eastern scene was dominated by the activities of Communist China. Far larger than its neighbors in both area and population, China has embarked in recent years on a policy of bringing about revolutionary change in all the areas subject to her influence.

On October 1 the Communist regime in China celebrated the completion of its first decade in power. During this period the country had started upon a drastic program of centralization and industrialization. The construction of railways, steel plants, electric power stations, and housing projects, and many other aspects of economic development have been pushed forward ruthlessly, hand in hand with the extension over the whole country of an administrative system more efficient than any China has ever known. The achievements of the 10-year-old regime have immensely increased China's prestige throughout the Far East. While the process of hauling China by main force into

ALEXANDER IN THE PHILADELPHIA EVENING BULLETIN

"MOUNTAIN VISTA"

the modern age at an ever-increasing tempo has involved immense cruelty and suffering, this consideration is not likely to carry much weight among other Asian peoples, no strangers themselves to cruelty and suffering.

The new China has emerged as an almost equal partner of the Soviet Union in the leadership of the Communist world. The relations between China and the USSR remain enigmatic, but something of their main lines can be discerned. For the present, memories of recent insecurity are strong enough for the "hang together lest we hang separately" mood to prevail, but it is clear that the two countries do not always see eye to eye. During his visit to Peking on the occasion of China's 10th anniversary celebration, Soviet Premier Nikita S. Khrushchev spoke (as he had in the United States) of the desirability of peace and the need for conciliation. The Chinese did not respond in kind, however, nor did a joint declaration of policy emerge from the meeting.

Divergences of attitude between Peking and Moscow showed up most clearly in regard to the border disputes between China and India which flared up in 1959. Premier Khrushchev did not support China against India in these disputes, although such a course would have been automatic only two or three years ago. Instead, he urged moderation upon both sides, and in his closing speech to the Supreme Soviet on October 31, he expressed regret concerning border incidents between "our two friends."

The border disputes had existed in embryo for some years, though carefully disregarded by India. In August 1959 they flared up into a question receiving worldwide attention when Chinese troops occupied an Indian military post at Longju, several miles inside the border of India's North-East Frontier Agency. Only then, in response to public pressure, did the Indian External Affairs Department publish the extent of Chinese claims on Indian territory, as shown for several years on Chinese maps. The startled Indian public discovered that these claims amounted to some 32,000 square miles of territory. The most serious incident of all was the clash on October 21 in the Ladakh area in eastern Kashmir, in which an Indian patrol was driven back with a loss of 9 men killed and 10 captured. This incident served to throw into relief what had been known for some months—that over a period of two years, at first unknown to the Indian government or ignored by it, the Chinese had built a road through Ladakh no less than 40 miles inside India's border. This road connects Khotan, in Sinkiang, with Gartok, in western Tibet, and is by far the best route from China to Tibet.

The series of incidents gravely weakened the position of Indian Prime Minister Jawaharlal Nehru's government, which had based so much of its policy on the much-publicized "five principles of coexistence" with Communist China. Prime Minister Nehru's position was further weakened by what many Indians considered the overly conciliatory and even pedantic way in which he dealt with the issues.

It remained uncertain at the end of the year precisely how much territory China hoped to gain, or what her objective was in a policy that seemed likely to alienate one of her best friends. The most disquieting possibility was that China intended to assert to the uttermost her ancient claims to hegemony throughout southeastern Asia. Another possible explanation was that some of the territorial claims were merely bargaining counters, which China might concede if guaranteed undisputed possession of one useful concrete gain—the Ladakh road. Yet it was by no means certain that such limited concessions were all that China really wanted; and Indians were disturbed about the possibility of China's attempting to gain power in the three mountainous border states of Nepal, Sikkim, and Bhutan, each of which has been linked to the Chinese Empire in the past.

Earlier in 1959, relations between China and other Far Eastern countries (particularly India) had been troubled by the stern Chinese repression of rebellions in Tibet.[1] At the end of March the Dalai Lama, nominal ruler of Tibet, fled to India to escape Communist troops. Both the presence of the ex-ruler and his anti-Chinese statements to the press caused India embarrassment in its dealings with China.

Shelling of the offshore islands under control of the Nationalist government of Taiwan—one of the great threats to international peace in the fall of 1958—was sporadic and unimportant in 1959, and there was no serious attempt to dislodge the Nationalist garrisons. Yet the basic causes of tension in the Taiwan area remained. The Communist government of China continues to regard the island as an integral part of its territory, while the United States continues to oppose this attitude. The Taiwan situation thus has latent in it at all times the threat of world war.

Some straws in the wind indicated that there might be a gradual modification of United States policy—but only in the direction of the "two Chinas" solution, by which the United States would recognize Communist China in exchange for the Peking government's recognition of Taiwan as a separate sovereignty. A special report by Conlon Associates, commissioned by the Senate Foreign Relations Committee and submitted to it on Oct. 31, 1959, urged that United States foreign policy should work toward the "two Chinas" solution. Commenting on the report, Senator William Fulbright, chairman of the committee, stated, "While I do not believe that the United States should

[1] During the 18th century Tibet was a part of the Chinese Empire; but by 1903, Lord Curzon, then viceroy of India, described China's claim to sovereignty over Tibet as a "constitutional fiction." Since 1958, however, when Chinese armies invaded Tibet, the country has again been subject to China.

recognize Communist China at present in view of their continued belligerence, I do not believe it is wise to continue to ignore the 600 million people on the Chinese mainland in the naïve belief that they will somehow go away."

There was no sign, however, of readiness on the part of Communist China to accept the "two Chinas" approach; and the Soviet Union, though conciliatory to the West in regard to other aspects of Chinese foreign policy, remained adamant on this point.

Another troubled area of the Far East in 1959 was Laos, which claimed before the U.N. Security Council on September 7 that she was being attacked by her Communist neighbor, North Vietnam. The situation in the jungle country of northern Laos, where the fighting occurred, was obscure, but the fact-finding committee sent out by the United Nations (over Soviet protests) was unable to accept the Laotian version of the events. The committee established that the fighting was on a much smaller scale than had been indicated by the Laotian government, and that there were no North Vietnamese troops among the Pathet Lao rebels—although the rebels may have received training and supplies from Communist sources. In the face of these discoveries, the possibility of American intervention, never great, evaporated, although American material help and military advice continued to be given. In 1954, Laos had been designated as within the sphere of interest of the Southeast Asia Treaty Organization (SEATO), but in 1959 the SEATO members refused to allow the alliance to become involved in Laotian affairs.

During 1959 the arrogance and aggressiveness of China at length began to arouse the suspicion of many countries of Southeast Asia, and correspondingly to create more understanding among them for the policies of the United States. The most actively anti-Communist of these countries was newly independent Malaya, a Commonwealth member which has had to fight Chinese Communist guerrillas for 12 years. Malaya cosponsored (with Ireland) the resolution in the U.N. General Assembly condemning China's stern repression of the rebellions in Tibet (October 1959). Even in countries which formerly had been rigidly neutral, the same tendencies were seen. Newspaper comment, and to some extent even official policy, became more critical of China. Dr. Sarvepalli Rhadakrishnan, vice president of India, and Sudibjo, Indonesian minister for national mobilization, both refused invitations to visit Peking in the autumn of 1959; and the Indonesian government continued to have differences with China on questions regarding the national status of Chinese residents in Indonesia.

In several respects the developments of the year in the Far East could be regarded with satisfaction by non-Communist countries. The Chinese claims on Indian and Pakistani territory had an almost miraculous effect in improving relations between those two countries. Long-standing disputes regarding demarcation of frontiers and apportionment of the waters of the Indus were dissolved away in a few weeks in the fall, although the more important Kashmir problem remained unsettled. Although the future of parliamentary government was clouded in India by Prime Minister Nehru's lessening grip on the Chinese situation, and in Ceylon by the assassination of Prime Minister S. W. R. D. Bandaranaike (September 26), the parliamentary regimes of Japan, the Philippines, and Malaya and the semimilitary governments of Pakistan and Burma showed a satisfactory stability. In Pakistan, in particular, Gen. Mohammed Ayub Khan, who celebrated his first anniversary in power in October, had great achievements to his credit, having tackled his country's problems with energy and success.

Police stand guard before Communist Chinese embassy in New Delhi, India, on September 6 as demonstrators protest China's violations of Indian border and its seizure of Tibet.

The successful conclusion in 1959 of protracted negotiations between the United States on the one hand and Japan and the Philippines on the other, regarding the future of the United States bases in these countries, showed that moderate concessions by the United States would satisfy nationalist demands in some cases at least, and would permit the United States to maintain many of its foreign bases for some years to come.

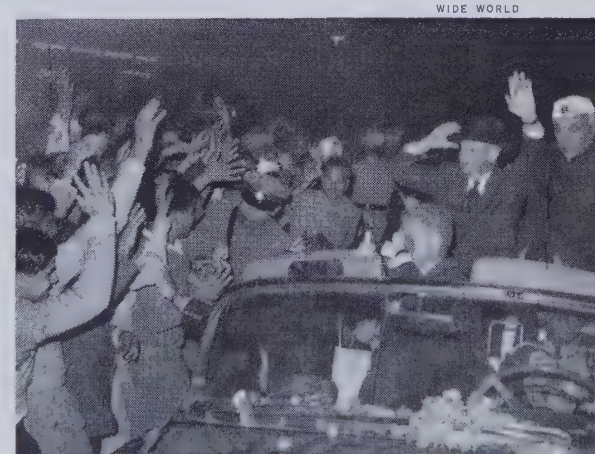
FARM CREDIT SYSTEM. On June 30, 1959, farmers and their marketing, purchasing, and service cooperatives were using $4.4 billion in loans from the cooperative Farm Credit System supervised by the Farm Credit Administration. This was a record fiscal year-end peak and was $730 million, or 20%, more than a year earlier. During the year, farmers and their cooperatives obtained $3.9 billion in loans—also a record high—which was $862 million, or 29%, more than in fiscal 1958.

The Farm Credit System is composed of about 850 national farm loan associations and 12 federal land banks—a completely farmer-owned farm mortgage credit system; 495 production credit associa-

New Delhi throng surges around car carrying President Eisenhower and Prime Minister Nehru (right) in a spectacular welcome as the president arrives in India on December 9.

WIDE WORLD



tions and 12 federal intermediate credit banks—a system of operating credit for farmers; and 13 banks for cooperatives, which provide credit for farmers' cooperatives.

Again in 1959, farmers and their cooperatives increased their capital stock ownership. They owned $317 million in capital stock of the banks and associations on June 30, 1959, as compared with $268 million a year earlier. The increase of $49 million was the largest in any year in the history of the system.

The investment market provides most of the system's loan funds. In the 1959 fiscal year, Farm Credit banks sold a record high of $3.2 billion in bonds and debentures, which was $600 million, or 23%, more than in the previous year. Of this total, $880 million was in federal farm loan bonds, $1.9 billion was in federal intermediate credit bank debentures, and $464 million was in bank for cooperatives debentures. These securities are not guaranteed by the United States government in any way.

On June 30, 1959, farmers were using 374,000 long-term land bank loans, totaling a record $2.3 billion, obtained through local national farm loan associations. While the number of loans outstanding increased only 2%, the amount was up 14% from a year earlier. The $574 million in land bank loans was 67% more than in fiscal 1958; of this amount, $52 million was in loans to 9,000 part-time farmers.

Farmers' need for operating credit reached a new peak in 1959. They obtained $2.4 billion from their 495 production credit associations, an increase of 25% from the previous year. On June 30, 1959, 282,923 members of production credit associations had loans totaling $1.5 billion, an increase of 27% in amount from June 30, 1958. Total membership in these associations was 506,000.

The 12 federal intermediate credit banks extended credit totaling a new high of $3.2 billion in the fiscal year 1959. Of this amount, 92.8% represented loans and discounts for production credit associations; 7.2% was for other financing institutions rediscounting with them; and 0.1% was for banks for cooperatives. Loans and discounts of $229 million for other financing institutions compared with $190 million in fiscal 1958.

Farmers' cooperatives borrowed $637 million from the banks for cooperatives in the year ended June 30, 1959, which was 20% more than in the previous year. The 2,378 loans represented an increase of 24% in the year. The $526 million in loans outstanding to 2,689 farmers' cooperatives on June 30 represented an increase of 29% in amount and 7% in number, compared with a year earlier. Both the amount outstanding and the number of cooperatives borrowing represented new peaks.

Chief, Research and Information Division,
Farm Credit Administration.

FARM STATISTICS. See Index entry, *Farm.*

FARMERS HOME ADMINISTRATION. Farmers throughout the United States borrowed $361,629,000 in insured and direct loans from the Farmers Home Administration in the fiscal year 1959, compared with a fiscal 1958 total of $330,162,000. The agency closed a total of 99,358 loans during the year. Borrowers used approximately 52% of the funds for operating purposes, 37% for farm real estate purposes, and 11% to meet emergency credit needs.

Approximately 196,000 farmers used the agency's credit services in the fiscal year 1959, including those who borrowed in previous years. Farmers eligible for credit were those who could not obtain adequate loans from other local sources. Some 39,000 fully repaid their loans during the year. The total repaid was $347,700,000 in principal and interest, compared with $316,700,000 in fiscal 1958. As of June 30, 1959, outstanding loans totaled $1,117,397,000, compared with $1,068,000,000 a year earlier.

Operating loans totaling $188,500,000 were made to 74,405 farmers, who used the money to purchase fertilizer, fuel, and equipment and livestock needed for full use of land and labor resources, to provide for other farm and home operating needs, and to refinance certain chattel debts. The agency made and insured 4,452 farm ownership loans totaling $64,733,000 to buy, enlarge, or develop farms or refinance debts. Private lenders provided $35,733,000 of this total through the insured loan program. Loans totaling $60,674,000 were made to 8,186 additional farm owners to build or repair farm houses and other essential farm buildings.

Soil and water conservation loans to 854 individual farmers and 53 associations amounted to $7,468,000, of which $2,492,000 was insured. Loan funds were used primarily to develop irrigation and farmstead water systems and to carry out soil conservation measures. The agency also made three loans totaling $402,500 to groups under a new program which provides that certain organizations may borrow to help pay for planning and carrying out structural and land-treatment measures to protect and develop small watershed land and water resources.

Emergency loans totaling $39,851,000 helped 11,405 farmers to resume normal operations after losses and damages caused mainly by floods and droughts during the year.

Applications and loans were handled by the agency's approximately 1,500 county offices in 50 states and in Puerto Rico and the Virgin Islands. Local county committees determined applicants' eligibility, reviewed borrowers' progress, and helped adapt national policies to local conditions.

Administrator.

FASHIONS. Silhouette.—The spring of 1959 saw the return of the waistline to the silhouette. American designers retained the feeling of height and waistline definition from last season's Empire and Directoire influences but stressed the entire waistline area, from the natural point up, doing away with the Empire skimpiness. All collections included clothes that never go out of style—the shirt-dress, the neatly fitted or full-skirted dress. There were a few carry-overs from the chemise in the less rounded, more supple, but still unfitted lines of some dresses.

Puffy tops on clothes of all kinds made the torso look delicate and fine-boned. Large collars stood out around the throat or curved down around deep necklines. Loose kimono bodices had draped armholes, and wide "doll dress" sleeves made the arms and waist seem thinner. Skirts were gently plumped out at the hipline by folds and gathers, or were pleated high in front and at the normal waist in back, leaving the sides slender. The waistline—on everything from tweed suits to ball gowns—was often wrapped with sashes, from neat bands or the popular soft, draped suede belts to gorgeous bowed affairs of silk satin. Many collections featured body-hugging set-in waistbands.

Sleeves created the biggest silhouette news for spring—at least editorially. Sleeveless jumpers had underblouses with hugh flowerlike sleeves; suits

GEORGE ROWEN

The international scene took on a note of glamor in 1959 as the United States and the Soviet Union exchanged showings of their latest fashions. (*Left*) American models show off designs which delighted women at the American National Exhibition in Moscow. (*Right*) Russian models pictured in New York City, where they appeared at the Soviet National Exhibition.

and coats had deep kimono sleeves or sleeves cropped short in various lengths.

Necklines were generally low. Every New York collection showed low-necked suits and coats, not meant to be veiled by anything more concealing than pearls or a bib necklace. The larger the collar, the more appropriate it was to frame a considerable expanse of chest. Wide and deep V necklines were seen both day and night.

For fall there was a buoyant, lifted feeling about the silhouette, with a "back to normal" look and a form that allowed the individual to mark her own waistline. The shaped-in sheath was back, but sloping or puff sleeves, big cape collars, and draped scarf necklines gave a new width at the top. The "free form" cut showed the influence of modern painting. The sharp, clean outlines of an abstraction were seen in such effects as triple-stacked pleats, terraced tiers of varying widths, split tunics, and the subtle architectural structuring intricately worked out in the outer seaming or lining. Above all, dressiness went side by side with the so-called "little boy" or Madison Avenue look.

The favorite daytime neckline was the shallow, collarless oval; for night, the daring plunge. Coat collars were up around the chin, and those on suits and dresses out around the shoulders and down in front. The long evening gown, in all fabrics and price ranges, became important for fall and holiday collections.

Fabrics.—The fabric story for spring 1959 featured weightless woolens, loosely woven and pressed into flat mat surfaces—airy as a breeze. There were loose bouclés and basket weaves with a porous look, and many fabrics had a thin-and-thick effect, such as mohair loops, which added texture to the surface. Wool jersey made a comeback for coats and suits, and silk was found looking like everything but silk—slubbed for suits, printed with tweed patterns, in ottoman coats, or with the textured, grainy look of the wild Indian silks in natural colorings.

Checks, the bigger the more exciting, predominated in both wool and silk for sport or dress wear. Flower patterns were newly formalized and dark-toned, some reflecting wallpaper tracery that stood out in bold relief on pale grounds.

Embroidery and lace touched both day and evening clothes. Bouquets were embroidered on organdy and dots on linen. Tinted cotton thread lace formed patterns on slim linen dresses, and many suits and dresses had crocheted edging. Big flat lace collars created a pristine touch on dark silk dresses.

Fall fabrics were luxurious. For day, reversible coats and costumes brought in about-face wools, exciting combinations of smooth textures and brushed surfaces that made each seem richer by contrast. Classic checks, herringbones, and diagonals were discreetly textured for a tailored daytime look, and tweeds were bewhiskered with reindeer hair. Jersey hit a new high in fall popularity, for dresses and suits and even coats. All fabrics had a thistledown softness, and chinchilla, long-haired cashmere, velour, duvetyn, and lacy openwork mohair were newly important. Ottoman, too, was a new fall star, seen at its best in day and evening coats.

Evening fabrics were aristocratic, the simpler tailoring of new evening styles calling for more formal moires, cut velvets, luxurious brocades, or damasks inspired by motifs of the Middle Ages.

Color.—Spring colors were vivid, both light and dark, and luminous as jungle landscapes. Greens predominated, in all shades, with violet and lilac as high fashion favorites. Yellows ranged from lemon sherbet to a strong Spanish saffron; and off-whites, from oyster to rich cream, were particularly important in coat and suit fashions. Red was not as important, except in spicy paprika and dark carnation colors. Pinks were brighter—azalea, fuschia, and geranium-toned. Beiges prevailed in shades from oatmeal to tea brown, and washes of white included the rich unbleached tones. Black and white made many dramatic interplays, and cobalt blues gave an electrifying effect.

Fall colors were newly muted in 1959. There was an interesting range of acid colors and neutrals so interplayed that they seemed like colors. Brown, in every variation, was a favorite for smart, understated clothes, and taupe and lentil colors were rich neutrals for day wear. The men's-wear look returned gray to popularity in deep shades, and black was made a great variable by texture differences, appearing smoky in heavy weaves or glowing as licorice on smooth fabrics.

White was important, from early fall into the holiday and resort seasons, and pastels, particularly in soft wool flannel, jersey, and knits, added new excitement to color schemes.

Sportswear.—Sportswear has become an American fashion institution. From beach clothes to elaborate evening separates, the American woman's practical approach to fashion, along with her love of casual but glamorous clothes at moderate prices, has created for sportswear one of the most interesting places in the ready-to-wear field.

In beach wear, the two-piece bathing suit came back in 1959, in cuts from conventional to the bikini, replacing the covered-up look of last summer's wool suits. In the field of separates, the classic lines and distinctive tailoring of city wear were combined with the uncontrived manner of the country for casual weekend clothes of great smartness. Silk knits were in demand and proved excellent for travel costumes. Italian knit ensembles and beautifully coordinated

sweaters, dyed-to-match silk shirts, and rich tweeds highlighted sportswear sales. Skinny pants came in gaily printed jerseys and knits, in addition to the usual fabrics. The cropped jacket, in braid-bound tweed, velveteen, or printed cotton and jersey, topped all casual wear with ease and dash for city or country. At-home clothes became an important category in sportswear, featuring coveralls, pants, and long skirts in all fabrics from cotton to elegant brocades.

Shoes.—Shoes for the first part of 1959 assumed an airy look frequently brightened by color. Keyhole openwork, string lacings, or a single strap arching over the instep were characteristic. Leathers were soft and polished, with patent prevailing, and the fabric shoe was popular. A flattering trend toward a contour toe, flatter and more rounded, predominated all year, and there were new middling heels, some of stacked leather, for day wear. Fall shoes, like clothes, were designed with a new refinement and practicality. Lines were elongated, trim, and firm. The bootie look, with the long vamp, influenced both casual and town shoes. Fall textures were gentler, reflecting the classic lines of clothes. Evening shoes appeared in damasks, silks and woven metallics to match formal costumes. Soft slipper-shoes in travel packs were one of the year's popular successes.

Millinery.—Spring hats celebrated a return to shape along with the silhouette. The pillbox reappeared, sometimes with a jaunty turned-up cuff, and turbans spiraled in prints to match dresses. Some crowns were high and pointed, some soft and manipulated. There were small hats —tailored in shiny straw or caps of flowers—and large ones swathed in chiffon or flowers.

Bows and bands were popular in every price range and fabric, sometimes coordinated with the costume. Fall hats were feminine. For daytime there were neat profile brims and crushable toques of felt or jersey. Tiny velvet pillboxes were worn like a crown jewel. Some hats concentrated all the width on one side, others—calottes or turbans—could be set straight on the brow or tilted slightly. Derbies and fedoras appeared, along with the mannish mode, in velours and velvet femininely dressed with veils. Velvet was appropriate with all costumes in this season of elegance, and fur hats of all kinds made a great impact on the market. For evening, tiny pillboxes, haloes of rich materials, were sometimes marked with real jewels to match opulent costumes.

Accessories.—Belts, as noted before, made headlines in 1959. Hardly a dress or sports ensemble failed to draw upon a belt line, and wide crushed suedes and fitted calf were universal favorites. Casual costumes were enhanced by Paisley and foulard ascots and combining stoles in textured wools, bold plaids, bright mohair, or self fabrics. The fur-lined stole was an elegant evening accessory. Eight-button gloves in blending (rather than matching) colors were a stylish touch. A harvest of cut-velvet and tapestry handbags pointed up the wealthy look of daytime clothes, and a wide range of fur bags played a prominent part.

Spring jewelry blossomed in beautifully enameled and jeweled flowers. Beads were a highlight of the year—pastel gems and crystals tumbled together, smoky and less brilliant than in 1958. The new higher necklines gave popularity to chokers and high necklaces.

Men's Wear.—The year 1959 saw the Continental style challenging the Ivy League look in men's wear. Pattern became more predominant, and off-beat colors brightened the picture. Styling was more formal, and fabrics were richer. The Continental influence was seen in form-fitting trousers, often cuffless, and shorter jackets with side vents, semi-peaked lapels, and squarer shoulders. This American Continental style, which appeared simultaneously in quality stores and bargain basements, was described by the New York *Times* as "a consciously dressy model with an urbane, sophisticated look." The overall favorite, however, was still the three-button, single-breasted suit with natural shoulders and the squarish-cut front.

Country clothes broke all conventional standards. Pattern and color abounded, and odd jackets, casual hats, and vests gave new life to men's fashions. Still popular were the blazer with decorative buttons, the bulky sweater, and stadium coats in synthetic fur pile and fleece.

Awards.—Two designers shared America's top fashion honor in 1959. On October 1, Pauline Trigère, French-born New York designer, and James Galanos, California's brilliant creator, both won the Coty American Fashion Critics' Award for the second time and thereby joined Norman Norell and the late Claire McCardell in Coty's Fashion Hall of Fame. Miss Trigère also received the Seventh Annual Cotton Fashion Award.

ANNE FOGARTY,
Fashion Designer.

FATS AND OILS. World production of fats and oils and oil-bearing materials apparently declined somewhat in 1959. While estimated production of cottonseed reached a new high, and soybean production was only moderately below the 1958 peak, production of peanuts and flaxseed was substantially lower than a year earlier.

The United States, easily the world's largest producer and exporter of fats and oils, had its second biggest output of soybeans in 1959—538 million bushels. This was 7% less than the record crop of 574 million bushels in 1958, but 65% above the 1948–57 average. United States flaxseed production dropped sharply to 22.7 million bushels, 41% below the 1958 crop and 43% below the 1948–57 average. Cottonseed production of about 6.1 million tons was about 27% above 1958, and was the largest since 1953. Peanut production was 3% below average, and about 13% below 1958.

Lard output for the year ended Sept. 30, 1959, was estimated at 2,703 million pounds, up 269 million over the preceding year.

Estimated production of fats and oils from domestic materials in the United States for the year ended Sept. 30, 1959, was 16.7 billion pounds, compared with 14.9 billion for the preceding year and 15.6 billion pounds for the year ended Sept. 30, 1957.

U.S. PRODUCTION OF FATS AND OILS
(For years ending Sept. 30)

Product	1958	1959
	(millions of pounds)	
Butter	1,524	1,439
Lard	2,434	2,703
Cottonseed oil	1,418	1,587
Soybean oil and oil equivalent of soybean exports	4,739	5,460
Other food fats and oils	662	740
Inedible tallow and grease	2,749	3,134
Linseed oil	523	638
Tall oil	608	750
All others	278	244
Total	14,935	16,695

World output of soybeans for 1959 was expected to be second highest on record—about 944 million bushels. Although this production would be about 5% less than the 1958 record, it would be almost 40% above the 1950–54 average. The decline in soybean output in 1959 followed 5 years of increasing world production. It was due almost entirely to smaller production in the United States and Communist China. These two countries normally provide about 95% of the world total.

World production of peanuts was estimated at 14 million short tons, 9% less than the record high of 1958, but 20% above the 1950–54 average. Smaller outputs in India, mainland China, and the countries of former French West Africa accounted for the decline.

World flaxseed production was estimated at 117.2 million bushels, 10% below 1958 and slightly less than the 1950–54 average output. The sharp decrease in United States production was the principal factor in the decline.

World cottonseed production in 1959 was estimated at a record 22.8 million short tons, up about 4% from 1958 and almost 25% above the 1950–54 average. The improvement was due to increased United States production, which more than offset a decrease in Asian production.

WORLD PRODUCTION OF MAJOR OIL CROPS, 1959

	Soybeans	Flaxseed	Peanuts	Cottonseed

World exports of fats and oils in 1959 were at a record high of over 8.5 million short tons. The United States accounted for 2.46 million tons

(compared with its 1950–54 average of 1.25 million tons), or about 29% of the world total.

C. J. ENZLER,
Information Specialist, Office of Information, U.S. Department of Agriculture.

FEDERAL AVIATION AGENCY. Created by the Federal Aviation Act of 1958, which was signed into law by the president on Aug. 23, 1958, the Federal Aviation Agency began operations on Dec. 31, 1958. It is an independent agency headed by an administrator who reports directly to the president. Creation of the FAA brought together into one organization the Civil Aeronautics Administration, the Airways Modernization Board, and the safety rule-making authority formerly vested in the Civil Aeronautics Board. Under the law, personnel from the armed services are assigned key positions in the agency's organizational structure to assure proper coordination and cooperation between civilian and military activities.

On Oct. 7, 1959, the FAA announced Project Friendship—a plan under which the agency, in accordance with the intent of the Federal Aviation Act of 1958, within two years would absorb most of the air traffic control functions and stations of the military departments, involving 2,095 military facilities at 337 locations.

Functions of the new agency are carried out by five major bureaus: (1) the Bureau of Flight Standards, which sets standards and maintains a check on the safety of aircraft, airmen, and air navigation and landing aids; (2) the Bureau of Research and Development, whose urgent task is the modernization of the air traffic control system to a semiautomatic basis by 1963 and to a fully automatic basis as soon as possible thereafter; (3) the Bureau of Facilities and Materiel, concerned with establishment and maintenance of air navigation aids, as well as with the development of public airports; (4) the Bureau of Air Traffic Management, concerned with air traffic control and the allocation of air space; and (5) the Bureau of National Capital Airports, which provides management responsibility for Washington National Airport and for the Dulles International Airport (which was under construction in 1959 at Chantilly, Va.).

The newly created post of civil air surgeon in the FAA calls attention to the importance aviation medicine and aeromedical research have attained in the field of nonmilitary flying. Technical advances in design, construction, and performance of aircraft present civil aviation with its own set of problems, not the least of which is the physical competency of pilots and air traffic controllers.

The FAA also has an Office of International Coordination which provides technical assistance to foreign countries and arranges training programs in the United States for foreign students, officials, and technicians.

In Oklahoma City, Okla., the FAA's Aeronautical Center provides a centralized facility for matériel, agency aircraft maintenance, flight inspection data processing, and personnel training.

At Atlantic City, N.J., the FAA maintains the National Aviation Facilities Experimental Center, which tests and evaluates much of the equipment and many of the systems and procedures proposed for the modernization of airways and air traffic control systems.

The FAA has six regional offices, each headed by a regional manager, located in New York, N.Y.; Fort Worth, Texas; Kansas City, Mo.; Los Angeles, Calif.; Anchorage, Alaska; and Honolulu, Hawaii.
